Philadelphia abounds in other objects of interest. The Girard College is the most splendid edifice in the United States. The building alone cost above one million of dollars. The Girard Bank, the Merchant's Exchange, the Custom House, are all fine buildings, worthy of admiration. The United States Mint is well worthy of a visit. The streets of Philadelphia are famed throughout the world. It is next to impossible for a man to lose his way. Philadelphians, like the rest of mankind, love the things of this world. Though not standing in as high an intellectual position as the Gothamites, they encourage the Drama and shower down wealth on the children of Song. Madame SONTAG had just closed a highly successful engagement. As an Operatic Artist, she ranks with the first in the world. No one can hear her without coming to the conclusion that "age cannot wither, nor custom stale," the variety of her charms, and excellencies of her voice. As a rival to Madame ALBONI, she has met with remarkable and deserved success. The advent of the two on our shores at the same time, proclaims to the world that Genius need but come to America to find a prompt appreciation and hearty welcome.

What young lady or sentimental young man has not read or heard of "Graham and Godey." Their Magazines, for many years before the advent of Harper and Putnam, were monarchs of the literary field. But now their glory and list of subscribers is departing. I was introduced, and spent a pleasant social hour with Mr. GODEY and T. S. ARTHUR, veterans in the fields of literary exertion—may their days be long in the land.

One is impressed with the stillness and air of general quiet, which pervades Philadelphia. The absence of dust, is another agreeable feature.—New York is always cursed by the demon, dust—and to be free from it, almost persuades a person that he is in the promised land. Gotham, however, is and will be the commercial metropolis of America—Boston and Philadelphia may envy, but cannot equal. Yours, &c., W. M. H.

## The Rail Fares to The West.

The Ohio and Lake Shore Roads and Lake line of steamers between Sandusky and Cleveland, and Buffalo and Dunkirk, have settled their through fares from Cincinnati at the uniform rate of $7 50. The Consolidated Central line from Albany to Buffalo announces $6 as the through fare between those cities. The Hudson River Road is charging $1 50. Altogether the charge from New York to Cincinnati is $15. The Buffalo and New York City Road, *via* Hornellsville, charges $7 50 to Buffalo; the Erie Road the same, we believe, to Dunkirk. So we have here three routes to the Lake, and at least two from the Lake to Cincinnati, all under the same aggregate charge.

As the Summer travel advances, we shall have more competition in an additional track on part of the Central line, and by the opening of the Canandaigua and Niagara Falls Road, and no doubt a further reduction of fare. The Central people already talk of $5 from Albany to Buffalo, and the New York City and Buffalo Co. will be ready for them, and so the Erie also.—*N. Y. Times.*

☞ In Central Africa a large number of Jewish negroes have been discovered. Nearly every family possesses the law of Moseson parchment. They trace their origin to the first captivity, when some of the Hebrews fled to the desert, and inter married with the natives.

☞ The Executive Committe of the American Tract Society held their monthly meeting on Monday evening. The total receipts of the year ending April 1, from all sources, amounted to $384,626. 85. There was printed during the year 63,989,076 pages.

## Literary Notices.

PUTNAM'S MONTHLY for May, gives its usual variety of readable articles. The first is by FENNIMORE COOPER, on "Old Ironsides"—as the famous frigate Constitution was named. There are many others, but we have read only "The Student Life of Webster," and "Lowell, the Poet," which are of much interest. Sold by DEWEY, and also at DARROW'S Main st. Bookstore.

THE ILLUSTRATED MAGAZINE for May, has many fine illustrations, with appropriate letter press, as usual. We see no falling off in this capital pictorial monthly. New York: A. MONTGOMERY, Publisher. DEWEY, Rochester, agent.

THE KNICKERBOCKER for May, gives, in another number of the "Bunkum Flag Staff," a capital article on the question—"Have we a Bnrebone among us?" McMAHON has it.

THE WOOL GROWER AND STOCK REGISTER for May, is a capital number. We see that an enlargement of the paper is proposed by the publisher—an addition of eight pages—giving room for advertisements, as well as for the proper matter of the work. See Prospectus in this paper.—We copy the following announcement from the "Editor's Brief Mention":

THE FIFTH VOLUME of this Journal will be commenced on the 1st of July ensuing. With increased facilities and greater experience, we hope to render the future numbers and volume every way more interesting and valuable than those heretofore published. The additiou of eight pages (either to the paper proper, or as a cover,) will give us more space for reading matter, and also for the publication of appropriate advertisements—while more time and labor will necessarily be devoted to the management of the work. Finding that there is an increasing demand for such a journal throughout the whole country, we shall use every proper endeavor to furnish a work which will prove acceptable and valuable to the large number of persons engaged or interested in the important branches of Wool and Stock Husbandry. If subscribers and others will second our efforts to augment the value and usefulness of the paper—by contributing to its pages, and extending its circulation in their respective localities—the favor will be gratefully appreciated, and the desired object readily accomplished. See Prospectus in next column.

## News Paragraphs.

☞ The Superintendent of Common Schools in this State, complains that the sum of $4,100 due from Rensselaer county towards its share of the School tax is withheld by the Collector of the county, although he has collected it,—on account of some dispute concerning the valuation of property between the City of Troy and the country towns. The sum of $398 is also due from Yates county. From the city of New York the sum of $129,971 is still due, nor is there any guaranty that it will be paid. This deficiency in the School fund, amounting in the aggregate to $134,470, is creating great difficulty and distress among the Schools of the State.

☞ THE editor of the Minnesotian is hopeful. He says:—"We were at one time one of the only three white men residing within the limits of the present State of Iowa, which now has a population of over 400,000. In our own beautiful territory we have made many trips between Praiaie du Chien and St. Peter's, and from St. Peter's to Traverse and des Sious, when the hotels we lodged at were in the open air, and our table furnished from the supply we carried, or from the game killed on the road. Yet with the blessing of God, we hope yet to travel in a railroad car on a continous route from the Minnesota river to New Orleans, and very probably to San Francisco."

☞ The Tribune says that the Ericsson is now lying at her dock in Williamsburgh, just above the Grand St. Ferry. Important alterations are going on in her machinery at Hogg & Delamater's foundry, which the owners are confident will considerably increase her speed. She is to be ready to sail for London, on her first passenger trip, soon after the first of July, at which time the improvements now going on will be completed, and she will be in order throughout. Capt. Ericsson and some of the principal owners will go out in her to Europe. She can accommodate about two hundred passengers. The ship is now open to public inspection.

☞ THE N. Y. *Evening Post* says that it is Mr. Thackeray's intention to return to this country in August, with a view to the delivery of a second course of lectures, on original subjects, which are now in preparation. The gentleman is said to have cleared $12,000 during his last visit here—occupying less than six months, including the voyage over and back. Thackeray is said to be poor, having lived the life of a spendthrift in his earlier days, and as he can replenish his purse more easily in this country than in Great Britain, we shall expect to see him again in the course of the summer.

☞ Fisheries are carried on in Sacramento river, California, quite extensively. Four hundred boats, valued at $70,000, nets valued at $80,000, and seines at $6,000, are used in them. The fishing season lasts from the first of February to the first of August, and during that period each boat averages $30 per day, and each hauling seine $100 per day.

☞ Dr. Lewis C. Beck, died in Albany on the 21st. ult. He was professor of Chemistry and the Natural Sciences at Rutger's College, New Brunswick, and Professor of Chemistry in Albany Medical College. Dr. Beck was appointed by Governor Marcy to the Department of Mineralogy in the Geological Survey of the State.

☞ The Rev. Alfred Wright, a missionary among the Choctaw Indians, died recently at the missionary station at Wheelock Choctaw Nation, Ark. Mr. Wright was instrumental in giving to the Choctaw people a written language, and of translating the entire New Testament and some portions of the old in their native tongue.

☞ Some of the new silver coin have reached here. Except their newness, they do not differ materially from the old, either in size or appearance. The full length figure of Liberty is given, instead of the head that appears on the gold and copper coins. This distinction will be useful to prevent mistakes.

THE STATE LOAN.—Owing to the passage of the Bank Basis bill, Mr. Oliver Holden, who subscribed for the whole loan of $400,000 at par for a four per cent stock, refuses to take it. Whether those who offered for the loan at a premium for a five per cent stock will stick by their bids, or refuse as does Mr. Holden, remains to be seen.

## News Brevities.

—— Emanuel, the richest Jew in England, is dead.

—— The Czar of Russia owns twenty-two million serfs.

—— It is said that no physician was ever made a peer in England.

—— The Negro Population in this State have decreased 3,000 in ten years.

—— It is stated that a passenger has never been killed on the Hudson River Railroad.

—— The Maine liquor law was defeated in the Canadian legislature by a vote of 32 to 28.

—— On and after the first of May, three trains per day between Toledo and Cleveland.

—— Goldschmidt, Jenny Lind's husband, has been giving successful concerts at Berlin.

—— The Maryland Senate has passed the bill incorporating the Maryland and Delaware Ship Canal.

—— Four thousand emigrants arrived at New York on Friday week—three-fourths of them from Great Britain.

—— There is a rumor that Indians on the Texan frontier are again committing depredations.

—— Violet Proctor died at the alms-house in New Bedford, Mass., on the 24th inst., at the age of *one hundred and eight years.*

—— It is rumored that Harrodsburgh Springs, in Kentucky, will be the site fixed upon for the National Military Hospital.

—— Railroad iron is quoted in New York at $70 per ton for British, and $79 for the American compound rail.

—— There are 5,316 sheep in the town of Haverhill, N. H., which will produce abont 16,000 pounds of wool, valued at say $8,500.

—— The whole parish of Sespenrode in Nassan, consisting of fifty persons, has abandoned its home, and emigrated to America.

—— The tolls at Albany for the first week of navigation show an increase of $6,753 79, over last year, and $1,888 over 1851.

—— The "rapping" mania is filling the lunatic asylums with victims, and doing more mischief than any other nuisance that ever existed.

—— The Tribune estimates the annual expenditure of New York men of business in advertising at over two millions of dollars.

—— The most intelligent correspondents foretell an exodus from Great Britain, the next five months, of 200,000 persons.

—— The Lockport Courier announces that Ex-Gov. Hunt has returned to that place and designs to take up a permanent residence there.

—— A number of forged notes on the Miami Valley Bank, of the denominations of $1, $5, and $10 have been in circulation at Cincinnati.

—— Hon. Edward Everett has been proposed for corresponding member of the French Academy of Moral and Political Science.

—— The King of Siam has become a subscriber to the Maulmain Times. His subscription was sent under convoy of a military escort.

—— Australia, it is estimated, will yield one hundred millions of dollars in gold a year, for many years to come, and California sixty millions.

—— The Court of Appeals in New York, have decided that oral declarations of a dying person in the presence of witnesses, constitute a good will.

—— Mrs. Begg, of Ayr, Scotland, sole surviving sister of Burns, aged 82 years, has sent a pair of socks of her own knitting to the New York exhibition.

—— California, including 25,000 Chinese, contained 308,507 inhabitants last December, per State census. Of these there are of white women only 29,711.

—— The past winter, in New England, has been three and a half degrees warmer than the average, and the quantity of rain two and a half inches greater.

—— The companies have left Frankfort, Ky. for California. They go overland by way of Independence. One of them takes along 400 head of cattle.

—— The stocks of the Central Line of Railroads continue to go up. The New York Times reports sales of Rochester, Lockport and Niagara Falls at 140a141.

—— The Vermont liquor law is producing the most beneficial results in that State. The people seem to like it, and the rumsellers have to obey it.

—— The Postmaster General has annulled the contract made by the late administration amounting to $500,000 for carrying the mails to California.

—— Dr. Burnsdale, of Toronto, Canada, has given $24,000 to Trinity College of that place.—The gift was consummated upon the venerable donor's 73d birth-day.

—— A lady who lately advertised in the London Times for a housekeeper, received in the course of four posts, upwards of two thousand replies.

—— A contract has been closed for the construction of a tunnel in the Pacific Railway, near, Jefferson City, Mo., which is to be 1000 feet in length, through solid rock.

—— The bed-chamber of Napoleon at St Helena is now a stable, and the room in which he breathed his last is used for threshing and winnowing wheat.

—— The sales of boots and shoes by the wholesale dealers in New York, amount to about $6,900,000 per year. There are four firms who each do a business of about half a million per annum

—— A comet will make its appearance in 1856 whose period of revolution is three hundred years. It was seen in the years 104, 392, 683, 975, 1261, and the last time in 1556. It is remarkably brilliant.

—— A Mr. James Peoples, from Oxford, N. H., visited the Boston State House on the 27th. He was 101 years old last September, hale and hearty. He buried his wife a month ago at the age of 93.

—— Vice President King, it is said, owned an estate of 2,000 acres of rich land in Dallas county, Ala., and 150 slaves. It is also stated that he has left the bulk of his property to the poorest of his relations, though all are comfortably provided for.

—— One of the most interesting relics in Philadelphia may be seen in North Second street, viz: the first lightning rod erected by Dr. Franklin, which still stretches its attennuated fingers towards the heavens.

—— English Railways, to stock a line requires half an engine a mile. The carrying stock of the Kingdom's railway includes sixty thousand vehicles, about one tenth of which are for passengers. The value of the whole stock is estimated at £4,000,000 sterling.

# Foreign Intelligence.

## Arrival of the Baltic.

The steamship Baltic arrived in New York on the 5th inst. bringing Liverpool dates of the 20th ult.

Corn Market.—Considerable business had been done in flour. Philadelphia 23s. Baltimore 22@23s 6d.

Yellow corn wanted; quoted 32s. White active at 31s.

Wheat in moderate consumptive demand and unchanged.

Provisions.—McHenry quotes: Bacon arriving freely, but not accumulating, and without decline.

Beef and Pork dull and nominal. Lard steady, 52@53s. Tallow in demand at advanced prices.

The principal news is the Chancellor of the exchequers financial statement. He proposes to continue the income tax on a diminishing scale for seven years, and extend it to Ireland and all incomes over £1000. Also to reduce the advertisement stamp duty, and some others.

The Kossuth rocket affair remains hazy.—Kossuth is apparently guiltless. Hale, the ostensible owner of the factory, threatens to prosecute the government. Meantime the munitions have been seized and deposited in the Woolwich arsenal.

There had been a great soiree at Glasgow to Mrs. Stowe, also at Edinburgh. She was enthusiastically received, principally in religious circles. The Earls of Shaftsbury and Carlisle were not on hand.

There will be no fete at Paris on the 5th of May. The Emperor wants to remove the first Napoleon's ashes from the Invalides to St. Dennis. The returns of the revenue show an augmentation on same quarter of 1852 of 14,000,000 francs.

The Dutch Government have protested against a Catholic Hierarchy in Holland, and withdrawn his Minister from Rome. An Austrian commission under the Presidency of Count Recesburg has been sent to Lombardy to report. The hasty withdrawal affects trade at Vienna.

The English and French Ambassadors had arrived at Constantinople. The English Ambassador had assured the merchants of the continuance of peace.

---

New Hampshire Schools.—The amount of money raised in New Hampshire, by taxes, for schools, in 1852, was $150,527 76—the amount contributed in board and fuel, $14,233 36; income of local funds, $8,559 67; amount of literary fund, $13,005; whole amount raised for district schools, $189,925 79; whole number of districts reported, 2,284; number of scholars attending school two weeks, over four years of age, 84,900; average attendance of winter schools, 55,770; average attendance of summer schools 44,564; number of male teachers in winter schools, 1,205—female, 1,080. New Hampshire stands at the head of the States, according to the census of 1850, for the smallest number of native adults who cannot read and write.

---

Iron Wanted.—It is said that the railroad, now in course of construction in Europe and America, will require for their completion no less than two millions and four hundred thousand tons of iron. To make this quantity will occupy all the rolling mills in the world, which are engaged in the manufacture of railroad iron, at least six years—those of Great Britain furnishing three-fourths, and the United States, France and Belgium the remaining fourth. The best authorities do not estimate the largest quantity of railway iron in any one year; even at this rate it will take six years to furnish iron for the roads already begun.

---

The Central Railroads.—The New York *Times*, in noticing the great interest apparent to ascertain the amount of surplus profits to be divided by the old companies, when consolidation is perfected, says the surplus of the Utica is supposed to be the largest—varying from 15 to 25 per cent., in the estimation of those who have watched the course of the Company. The Syracuse Road is also supposed to have a round surplus of 7 or 10 per cent. The Rochester a moderate surplus, and the Niagara Falls and Mohawk also moderate—probably from 3 to 5 per cent. each.

---

A Round Salary.—A gentleman has been appointed Agent of the Panama Railroad Company at a salary of $60,000 a year; in addition to which four Insurance Companies have agreed to pay him $10,000 each a year, making $40,000. Total amount of salary per annum, $100,000! This gentleman takes out letters of credit to draw for one million a month on account of gold dust, and has one-fourth interest in the profits. On the whole, including salary and business, we should think this gentleman might manage to make both ends meet.—*Mirror.*

---

Important to Postmasters.—The Postmaster at Sylvania, in Scriven county, Geo., has been arraigned and fined fifty dollars, for delaying a letter in his office. The law makes it the imperative duty of every Postmaster to forward all mail matter deposited one half hour before the departure of the mail, unless longer time should be granted by the Postmaster General on account of the business of the office. There are also several penalties for delaying papers, &c., after they have been mailed and are on their way to their places of destination.

---

Earthquakes in California.—Since November 21st, 1852, there have been thirty-two shocks of earthquakes within the limits of California. The effects on the desert have been considerable; so that the waters of the New River, the Big Lagoon, and other points of obtaining water, which made their appearance on the surface in 1848, and 1849, have now disappeared, and in their places volumes of sulphurous mud and efflorescent sulphur have appeared.

---

A Road Well Watched.—The Hudson River Railroad, 150 miles in length, employs 225 "flag men," stationed at intervals along the whole length of the line. Just before a train is to pass, each one walks over his "beat," and looks to see that every track and tie, every tunnel, switch, rail, clamp and rivet is in good order and free from obstruction. Every inch of the road is carefully examined after the passage of each train.

---

☞The Lansing (Mich.) State Gazette says the Capital grounds are being ornamented with shrubbery and ornamental forest trees under the direction of the State officers—a most commendable improvement; its former bare and bleak appearance was a reproach to the good taste and liberality of the State.

John J. Nourse, of Andover, weighs 388 lbs., and in the same town are, or were, three sisters who weighed 800 pounds.

# Market Intelligence.

Rural New-Yorker Office,
Rochester, May 4, 1853.

The market for the present week is far from being buoyant. Continued breaks in the canal have left us without navigation, and brought things to a stand still.

Grain—Wheat has been sold at $1,12½, though $1,10 is conceded the highest price. Corn brings 58@60c. Barley dull at 56c. Oats in good demand at 40@42c.

Provisions—There is no marked activity in this branch of trade. Prices have undergone little change.

Seeds—Clover is selling at $6,75, and not very plenty.—By the quantity, it will not command even $6,50, and few are desirous of purchasing. Timothy without change.—Peas are much sought for and meet a ready sale, at good prices.

No further changes or sales of note have met our observation.

### Rochester Wholesale Prices.

## NEW YORK MARKET.

New York, May 2, 7 P. M.—Ashes—Market steady but quiet. Sales 40 bbls. at $5 for Pots, and $5,50 for Pearls.

Flour, &c—There is increased firmness and buoyancy in the low grades of State and Western flour. Sales 500 bbls. at $4,75 in bond. Sales Western Canal are 6,300 bls. at $4,62½@4,75 for common to straight, mainly at $4,68½@4,75, and $4,75@5 for common to good Ohio and mixed to fancy Michigan and Indiana. Rye flour firm and not plenty at $3,87½ for fine, $4,25@5,50 for super.

Grain—There is a good demand for wheat. Sales 500 bu. mixed Ohio 1,15, 2,800 bu. prime white Canadian to arrive at about $1,14. Barley inactive at 64@70c. Oats heavy and plenty. 43@45c for Jersey, and 41@47 for State and Western. Corn better and in good demand; sales 25,000 bu. at 60@62c for unsound, 63@64 for mixed Southern, 64@65½ for white, 68 for Southern yellow, 66@67 for Jersey yellow.

Provisions—A dull market for pork; large arrivals at Buffalo and Oswego; transactions are only 150 bls. at $13,-25@37 for prime, and $15,75 for mess. Lard hardly so active; sales of 210 bls, and tes at 9¾@10. Butter quiet; 17@20 for new State; and 9@14 for Ohio. Cheese selling at 8@9¼ for new; 9½@10 for old.

## ALBANY MARKET.

Albany, May 2.—Flour—There is a better feeling in our market for Western and State Flour, but there is no change to notice in prices of either description.

Grain—In wheat but little has been done. Some 200 bu. Mediterranean sold at $1,12½. In other descriptions nothing has been done. Barley is rather quiet and lower.—Sales 550 bu. ordinary two-rowed at 65c. Corn is quiet.—Oats are dull and slow of sale at 16@17c.

Provisions—There is a moderate business doing in barrel and cut meats at former rates. Lard is steady. Inferior qualities of Butter are dull. Good dairies are in fair request.

Seeds—Clover is rather lower and is selling freely at a slight decline. Sales of medium State at 11, and large at 12. Timothy has also declined and is selling at $2,50@3.

## BUFFALO MARKET.

Buffalo, May 2.—Flour—There was good inquiry for flour this morning, and sales of 1,800 bls. Ohio, Michigan and Indiana at $4,12½; and 100 bls. fancy Ohio at $4,25.

Wheat—In fair demand, and supply scarce. We note sales of 5,000 bu. mixed Ohio, and 5,000 bu. Mansfield on private terms.

Corn—In good demand and market firm. Sales 11,000 bu. at 53c afloat, and 5,000 bu. at the same quotation from store.

Provisions—Steady at previous rates. Mess pork sells in small parcels at $15. Hams and shoulders unchanged. There was a sale of hides this morning, green at 6c per lb and dry at 12@12½.

Canal Freights—Remain unsettled.—[Com. Adv.

## NEW YORK CATTLE MARKET.

NEW YORK, April 25.—At Washington Drove Yard—At market, 2,800 Beef Cattle—2,000 Southern and Western, remainder from this State.

The supplies the past week have been rather more plenty, and prices for the better qualities are a shade easier.—The range of the market to-day, is from 7½ to 10c. per lb. About 300 head left over unsold.

At Browuing's—Sheep were freely offered, this week, and prices were a shade higher. The offerings amounted to 1,200, and were all sold but 80, at from $3,50 to 7,50@$11.

Cows and Calves—100 offered, and all but 10 sold at from $25 to $48.

At Chamberlain's—Offered, 300 Beef Cattle. Prices from 8½ to 9½c. per lb. Extra 10c.

75 Cows and Calves offered, and all sold at $25@35 to 42,-50@50.

1,700 Sheep offered; all but 300 sold at $3,50@5,50 to $6@7,50.

Hogs sell at from 5½ to 6c. per lb.

## ALBANY CATTLE MARKET.

ALBANY, April 25.—Woolford's Bull's Head—At market, 452 Beef Cattle. Prices extra, $7,50; 1st quality $7,00; 2d do. $6,50; 3d do. $6.

Sheep—350 in market—Prices, $4@6,50.

Swine—500 in market—Prices, $6@6,50.

## CAMBRIDGE CATTLE MARKET.

CAMBRIDGE, April 27.—At market, 639 Cattle, about 500 Beeves, and 130 Stores, consisting of Working Oxen, Cows and Calves, yearlings, 2 and 3 years old.

Prices—Market Beef—Extra, per cwt. $8,50@8,75; 1st quality, $8; 2d do, $7,50@7,75; 3d do, $7@7,25; ordinary $6@6,75.

Hides—$4,75@5 per cwt.

Tallow—$7@7,50 per cwt.

Pelts—$1@1,50.

Calf Skins 10c per lb.

Veal Calves—$3, 4, 5@9; 227 at market.

Stores—Working Oxen—$101, 104, 108, 112, 125, 131, 140@172.

Cows and Calves—$28, 30, 33, 36, 41, 52@71.

Yearlings—$13, 15@17

Two years old—$30, 31, 34, 37, 40@48.

Three years old—$39, 41, 45, 52@71.

Sheep and Lambs—1,047 at market.

Extra, $8, 9, 9½, 10@12.

By lot—$4,50, 5, 5,75@6,50.

Swine—Wholesale hard fat, at 6c, still fat, 5½@5¾c, and shoats, to peddle 6½@7c., per pound.

## BRIGHTON CATTLE MARKET.

BRIGHTON, April 28.—At market 950 Beef Cattle, 27 pairs Working Oxen, 111 Cows and Calves, 1,000 Sheep and Lambs, and 7,900 Swine.

Prices—Beef Cattle—Extra, $8@8,50; 1st quality $8; 2d do, $7,75; 3d do. $7,25; ordinary $6@6,50.

Working Oxen—Sales at $78, 80, 85, 90 100, and 125.

Cows and Calves—Sales at $24, 26, 28, 31, 35, 40 and 45.

Swine—6¾@7¼c; retail 7@9c. Fat hogs 6@6¼c.

# Deaths.

At Niagara Falls, on the 28th ult., of congestion of the Lungs, CAROLINE ELIZA, wife of F. W. Perry, late of this city.

**SEED POTATOES.**

WE have on hand 200 bushels of the celebrated White Mercer Potatoes, at $2 per barrel, delivered at the Railroad or Canal, in this city.

100 bushels Early Junes.
50 do Mountain Junes.
25 do Wild Mexicans.
25 do Carters.
50 do Irish Cups.

J. RAPALJE & CO.
172-tf. 63 & 65 Buffalo st., Rochester.

**For Sale.**—Morgan Stud "Z. Taylor;" deep bay color, (perfect figure of the old Gifford,) three years old next 8th June. Also a fast mare, (dam of "Gifford Morgan,") in foal by Morgan horse "Gen. Gifford."

March, 1853. J. DORR, Scottsville, N. Y.

*Popular Journals, for National Circulation!*

THE WOOL GROWER AND STOCK REGISTER:
A MONTHLY JOURNAL
Devoted to the Wool and Stock Growing Interests.
VOLUME V,—FOR 1853-4.

The large measure of support which has been accorded to this Journal during the past year, encourages the Publisher to make commensurate effort and expenditure to improve the forthcoming volume. The Fifth Volume, commencing with July, 1853, will, therefore, be enlarged by the addition of eight pages (for notices, items, advertisements, &c.,) and improved in Contents and Appearance. The design is to render the work invaluable to all growers of Wool, and every Stock Breeder, Grazier, Dairyman, &c.

As the Wool Grower and Stock Register is the *only* journal in America devoted primarily to the important and profitable interests of Wool and Stock Growing, &c., it should be in the hands of

**Every Owner of Domestic Animals,**

whether located East or West, North or South, for the subjects discussed in its pages are interesting in all sections of the Union, the Canadas, etc.

The ensuing volume will contain a large amount of useful and reliable information in regard to Wool and Stock, not given in any other publication. The monthly *Review of the Wool Market* is made out with great care and entirely idependent—designed for producers instead of speculators,—and consequently alone worth many times the price of the paper to any wool grower. In the Stock Department we shall describe and discuss the merits of the various breeds of Domestic Animals, and give Pedigrees and life-like Portraits of superior Cattle, Horses, Swine, Fowls, &c.; important information on Dairying, the Diseases of Animals, &c.,—notice the principal importations and sales of improved stock—carefully Review Cattle Markets, &c.

**Form, Style and Terms:**

The Wool Grower and Stock Register is published monthly, in Octavo form, with Title Page, Index, &c., at the close of each volume. The Fifth Volume will be published in the best style, and illustrated with numerous valuable and appropriate Engravings—embracing Portraits from life, of Sheep, Cattle, Horses, Swine, Poultry, &c.—Designs of Farm Buildings, etc.—with proper descriptions.

Terms—In Advance:—*Fifty Cents a Year. To Clubs and Agents,—Five copies, $2; Eight copies, $3; Eleven copies, $4; Twenty copies, $7, and any additional number at the same rate. The three first volumes, bound, at 40 cts. each,—bound at 35 cts., or the three for $1.*

Subscribers and friends of the work, Post-Masters, and others, are respectfully solicited to lend a portion of influence in its behalf. We trust that each and all who can consistently do so, will form clubs in their respective localities, from Maine to California.

☞ Now is the time to Subscribe,—as all subscriptions should commence with the volume. Bills of all specie paying banks, and postage stamps, received at par. Money, properly enclosed, at our risk,—if addressed to

D. D. T. MOORE, Rochester, N. Y.

MOORE'S RURAL NEW-YORKER,
THE LEADING WEEKLY
**Agricultural, Literary and Family Newspaper.**

An increase of *over five thousand subscribers* during the past two months, proves that the Rural is the most popular journal of its class in America—and certainly no paper, however cheap, could advance thus rapidly without possessing more than ordinary merit.

The New-Yorker is published every Saturday, in the best style. Each No. contains Eight Double Quarto Pages, (forty columns,) illustrated with handsome Engravings.

Terms—In Advance:—*Two Dollars a year—$1 for six months. Three copies one year for $5; Six copies, and one to agent, for $10; Ten copies, and one to agent, for $15; Twenty copies, for $25.* ☞ *Large Premiums for subscribers. Specimen Numbers, Premium Lists, &c., sent free to all post-paid applicants. Give us your address.*

☞ The Spring Series of Vol. IV, will commence April 2d, when we shall add largely to former edition in order to supply new subscribers from that date. Hence, *Now is the time to Subscribe*—though subscriptions may begin with any number. Money, properly enclosed, at our risk.

Address D. D. T. MOORE,
March, 1853. Rochester, N. Y.

**D. P. NEWELL'S FOWLS.**

Fancy Fowls.—Few persons in this section have carried the raising of improved breeds of fowls to a greater extent than Mr. D. P. Newell, of this city, who is an artist of good reputation as well as a thorough bird-fancier. On Saturday he exhibited in the Arcade, three Brhama Pootras, of magnificent size and splendid condition. They would take the palm anywhere. Besides, he had a pair of black Java fowls—the most beautiful of their tribe—more fit for pets than poodle dogs, and as handsome as Canarys. In size they are not much larger than pheasants, their plumage is as dark as the raven and as glossy as silk.—These were procured for Mr. Newell, by a Boston gentleman.—[Rochester Daily Democrat.

**GLEN HAVEN WATER CURE.**

THIS Celebrated Institution, by the peculiar method of treatment which Dr. Jackson practices, and the success attending it, is greatly attracting public attention throughout the Union. The past year it has been visited by invalids from not less than 20 of the States and the Canadas, and hundreds of persons regarded as incurable, have received immense benefits from its waters.

Those wishing information can receive a Circular, free of charge, and those wishing advice for home treatment, can have it by enclosing $1, post-paid, to

JAMES C JACKSON, M. D.,
175-4t Scott, Cortland Co., N. Y.

**FARM FOR SALE.**

I OFFER for sale the premises situated in the town of Lima, two miles south of Lima village, and ½ a mile west of the plank road, formerly owned by Hiram Warner. Said farm contains 76 acres, is well watered by a spring and wells, with sufficient timber for farming purposes, and is adapted for wheat raising or for grazing. It will be sold on reasonable terms. Price from $15 to $50 per acre. Inquire of the subscriber at East Avon, Liv. Co., N. Y. [175-t2eow*] HORACE WARNER.

**MEXICAN WILD POTATO.**

ALL those who have become acquainted with this kind of Potato, agree in pronouncing it superior in quality to any other that has ever been produced, or introduced into the country. It is also early and a great yielder. A few bushels of them may still be had at No. 68 State street, Rochester, of [175-1t] BRIGGS & BRO.

FIFE SPRING WHEAT, grown by Geo. Shaffer, of Wheatland, for sale at the Monroe Seed Store and Agricultural Warehouse, 68 State St., by

[175-1t] BRIGGS & BROTHER.

**MERCHANTS SUPPLY STORE.**

THE Subscriber has made extensive arrangements which enables him to supply merchants with any of the tools named in the annexed list, at the lowest current rates, either in large or small quantities. The goods are ordered direct from the manufacturers, and are in every respect the best of their kinds made in the United States.

500 dozen Dunn's Grass Scythes, German, Cast and Silver Steel.
400 do. Dunn's Grain Scythes, the best in market.
100 do. Clapp's Patent Scythe Snaths.
50 do. Lauson's do. do.
50 do. Clark's Ohio Patent Snaths, Scythes to fit.
50 do. Wood's Scythe Snaths, cheap.
50 do. Brand's Manure Forks.
75 do. Do. Straw Forks.
100 do. Do. Hay Forks.

A good supply of Reynolds' Hay and Straw Forks.
100 doz. Whitlock's Solid Cast steel Hoes.
200 " Stillman's Cast steel Hoes.

Scythe Stones, Rifles, and other tools in the same line, all of which will be sold on the lowest terms. Sale rooms at the Agricultural Warehouse of E. D. Hallock, 24 Exchange street, Rochester, N. Y. ☞ All orders by mail promptly attended to. HIRAM C. WHITE.

**Important to Farmers**
**PORTABLE MILL.**

[From the Ohio Farmer, December 2, 1852.]

Ross' Improved Patent Conical Burr Mill Stones.—Our readers will many of them remember that Ross' Portable Burr Stone Mill took the First Premium at the Annual State Fair, held in this city a few weeks since.—This admirable invention must commend itself to every one who has witnessed its operation. In the first place it is easily portable, simple in structure, does not easily get out of order, and does its work with great rapidity and perfection. It may be used for grinding the coarsest food for cattle, or the finest meal for family use. It is also well adapted for grinding wheat, rye or buckwheat. It is indeed a perfect grist mill in miniature, and we would advise every farmer, if possible, to procure one. The expense of one of these mills, with the apparatus for horse power, can not be very great; or a number of farmers might club together and procure one, which would be sufficient for all.

Mr. Ross is, we believe, a resident of Rochester, N. Y.

N. B.—Any further information relative to the Conical Mill can be obtained by letter, post-paid, or by calling at the factory of CHARLES ROSS,
2d story Phenix Building, Aqueduct-st.,
154-tf opposite the Arcade, Rochester, N. Y.

**SEYMOUR & MORGAN'S PATENT**
**NEW YORK REAPER, FOR 1853.**

THE great value and importance of the *Reaper* to Grain Growers of the world, is established beyond a question of doubt. Frequent tests have been made before Agricultural Societies both in this country and in England, proving the Reaper to save in a single harvest its first cost to the purchaser, over the ordinary way of cutting grain. Probably no implement is as valuable to the farmer where any considerable quantity of grain is raised, as the Reaping Machine

At the present time there are several very good Machines before the Public, and now the question seems to be—which is the best? We claim precedence for ours, considering some of the following principles embodied in our Patents, that are essential to a Reaper and can not be found in any other Machine; which enables us to offer to the farmers of the United States a

**Superior and Perfect Reaping Machine,**

which, for durability, exactness of construction, perfect manner of cutting grain, ease with which it may be worked, and lightness of draught has

*NEVER BEEN EQUALLED!*

1st. The cutter bar is placed nearly on a line with the axles of the driving-wheel, and nearly opposite the driving-wheel is the ground-wheel, which being *thirty inches in diameter*, lessens the labor which has heretofore been performed in working such Machines, and does away with all difficulty in backing and turning.

2d. The knife or sickle is scalloped and in sections, which *cannot be clogged*; and in case of accident can be repaired by any good blacksmith.

3d. The man in discharging the grain stands on the *rear* of the platform, where he has his work before him and can perform it in a perfectly natural and easy manner; and also from the construction of the attendant's stand he may change his position according to the length and amount of straw cut.

4th. The new and improved combination box, containing the smaller gear, combines *great strength* and *durability*, with perfect simplicity of arrangement, preventing any displacement or twisting of the gearing; in this it possesses great advantages over any other similar Machine and so far as we know, there have been no failures in the large number made.

5th. The lightness of the Machine and mainly of the side-draught or pressure, which being obviated, enables a *single team* to pass with it over uneven ground with speed and ease.

We make our acknowledgments to the farmers for that generous confidence we have labored so diligently to sustain; and encouraged by the past, we have again commenced the manufacture of a large number for 1853, which we sell under a strong "warranty." The Reaper shall be well made, of good materials, durable with proper care, can cut from 15 to 20 acres per day with one span of horses, and do the work better than done by ordinary cradling, or no sale!

Innumerable certificates might be given of the great value of this Machine, but our Reaper is so well known, we deem it unnecessary. By reference to the Reports of our State Agricultural Society, on the trial of Reapers, held at Geneva, N. Y., in July last, it will be seen this Machine cut a given amount in about three-fifths of the average time of other Reapers. The following gentlemen are Agents for the sale of the New York Reaper, and any orders received by them will be filled in due season:

S G Williams, Esq., of Janesville, Wis., is our General Agent for the West, and is authorized to appoint sub-Agents, except in Ohio and Southern Indiana.

Wm Bosworth, is General Agent for the State of Ohio, except a few counties. Messrs. Warder & Brokaw, of Springfield, Ohio, have the exclusive right to make and vend for Southern Indiana, north to the 40th deg. of lat. running east to the Ohio Canal, including the south-west corner of the State of Ohio.

Brockport, Monroe Co., N. Y. [175eowtf.]

**E. D. HALLOCK, No. 24 Exchange St., Rochester,** has been appointed sole Agent for the sale of the above Reaper, in that city. He will have a Reaper on exhibition at his Agricultural Warehouse, and will at all times be prepared to fill orders at manufacturers prices.

**PEAS! PEAS! PEAS!**

WE most respectfully call the attention of Farmers and others to our extensive assortment of Field and Garden Peas; among the former are

200 bushels Common Marrowfats.
400 do. Junes.
200 do. Golden Vine.
200 do. Creepers.
400 do. Common Canada.

And among the latter are

25 bushels Superior Early Kents, earliest grown.
5 do. Prince Albert.
100 do. Early Warwick—superior.
200 do. do. Washington.
100 do. Marrowfats, superior article.
50 do. Black Eye Marrowfats.
25 do. Dwarf Blue Imperial.
10 do. Monastery Marrow.
25 do. Blue Marrowfats.

Also, various other choice kinds,—all of which will be sold at small profits for cash, at the Genesee Seed Store 63 & 65 Buffalo st., Rochester.

172-tf J. RAPALJE & CO.

ROCHESTER SEED STORE.
**JAMES P. FOGG, Proprietor.**
29 *Buffalo St., opposite the Arcade, Rochester, N. Y.*

THIRTY THOUSAND DOLLARS worth of genuine *Garden and Field Seeds*, put up at this establishment, in packages and small papers, and can be had of any of the following Agents. These seeds were mostly grown by the proprietor, or imported by him from one of the best seed establishments in London.

New

# Poetical.

Written for the Rural New-Yorker.

## FAIRY BELLS.

O, how merrily they chime
In the gay and happy Spring,
When the silvery waters dance
And the birds are on the wing.
On the lofty mountain top,
In the grassy, dew-gemmed vale,
They are chiming, chiming ever
To the music of the gale.

O, how tunefully they peal
On the Summer's gentle breeze,
Through the green and waving meadow,
Through the tall and leafy trees;
Fairy tones are sweetly floating
On the streamlet's tranquil breast,
They are pealing, pealing ever,
And their music ne'er may rest.

O, how mournfully they sigh
In the Autumn of the year,
O'er the dry and withered leaves,
O'er the floweret's early bier;
Where the lily cups are lying
On the sod so cold and pale,
They are sighing, sighing ever,
With a low and mournful wail.

O, how shudderingly they moan
In the Winter's chilly blast,
When a white and gleaming robe
O'er the sleeping earth is cast;
Where the waters shrink away
From the forest-king's icy breath,
They are moaning, moaning ever,
With the bitterness of death.

Fairy music, fairy music,
May it ne'er from earth depart,
Even as it chimes in nature,
So it chimes within the heart;
Ringing sweetly when we're joyous,
Moaning when the grief-tide swells,
They are pealing, pealing ever,
Fairy bells, sweet fairy bells.

JENNY.

# Rural Sketch Book.

## LUCK IS EVERY THING.

BY J. R. CHANDLER.

THE course of true love, it is said, did never yet run smooth; and those who have had experience on that turnpike of the affections, or rather railroad, as it is soon run over, bear testimony to the jolts, "runnings off," and mashings up alive, of which the poets speak. We have no great taste, in this time of politics and perplexities, to dabble in "fancy stocks," and risk our reputation for gravity; yet the illustration of an aphorism of admitted truth, may be considered seasonable, and the moral deduced from the illustration may compensate some for the time of reading it.

In the year 1814—we remember the time well, because a part of the incidents of the story were connected with a great event, an event not likely to be forgotten—well, in the year 1814, a young man, who to a visionary mind, and a consequent want of employment, added a most desperate affection for a young lady, quite too good for him, if his business pursuits were alone considered, but just his match, if confiding affection, purity of mind, and innocence of purpose, are the reward of large endowments, strict integrity, and a desire for honest competence, without the means of obtaining it.

There was no more pleasing young man in the thriving village than Henry Bradford; and everybody agreed with his neighbors, that he was the most agreeable person, and the best educated about. But he did not study law, he despised medicine, and did not take to the church; he had often thought of "merchandise," but that required a capital, which he could not raise, and so he did not get ahead, though he was forever on the brink of some wonderful success, which he certainly would have secured, if he had only entered upon the enterprise.

Mary Carver evidently loved Henry Bradford; for knowing that, excepting his handsome person, pleasing manners, and good character, he had nothing to offer, she would not otherwise have been deaf to the offers of so many men, whose character and positions rendered them desirable to the family. Those offers were repeated too often, and hints so strong were given to Mr. and Mrs. Carver, that it was deemed proper, after a serious deliberation in cabinet council, to admonish their daughter that Henry was in no business, and was not likely to be in a way to maintain a family.

Mrs. Carver opened the diplomacy with her daughter, and, after two or three conferences, retreated under the laugh of Mary, who declared that she did not doubt that Henry would one day be rich enough to take care of both, for he had had a dream that he should be. Mrs. Carver had no disposition to laugh in such a serious mission, and no desire to be angry with her daughter.

Mary, however, knew that when her father came to negotiate, she would have to use other arguments than laughter, and therefore she admonished Henry of the approaching storm. Henry thought of it two or three days, an unusual time for him to devote to any thing like his personal affairs.

At length the family was honored by a formal offer from a clergyman in a neighboring town. He was learned, pious, rich, and respected, and such an offer was not to be slighted. It was not slighted. Old Mr. Carver took the subject to heart, and Mrs. Carver gave her sheer muslin cap a double clear starching upon the very idea of becoming mother-in-law to a minister.—Mary pondered these things in her heart.—She saw the improbability of Henry's ever attaining a situation that would warrant matrimony. She was listening to her mother's account of his want of application to business, his apparent disregard of all the ordinary means of attaining competence, and of his utter lack of what is called common sense; and the old lady concluded her homily with the remark, that she believed Henry Bradford would think more of a dream of wealth twice repeated, than of the best prospects that ever presented business preferment.

"Mother," said Mary, "Henry is not a fool."

"No," said Mrs. Carver, hesitatingly, "he is not a fool, certainly."

"Why, then, do you talk so of him?" asked Mary. "But here, he is coming now," continued the girl.

"Speak to him plainly, my child," said Mrs. Carver.

Mary made no answer, for she was a little mortified at the ludicrous turn which her mother had given to Henry's rather dreamy propositions, though she never had heard him build any castles in the air out of such materials.

Henry came with his usual pleasant humor, and sat down by Mary, and, after a few words, he perceived that something was wrong.

"Mary," said he, "have you been reading the Sorrows of Wertor?"

"No, Henry, but I have been listening to mother's sorrows—her lamentations over you. She says—"

"Never mind what she says, Mary, as I perceive it is not very good; just listen to what I have to tell."

"Well, what is it, Henry? I hope it is good."

"Excellent, capital; it will be delightful."

"Do, then, tell me what it is."

"Why, last Sunday night, I *dreamed that*—"

"*Dreamed!*" exclaimed Mary, with a most dolorous sigh.

"Aye, *dreamed*."

"——Well, go on."

"I dreamed that I had drawn ten thousand dollars in the Plymouth Beach Lottory."

"Well, what then?"

"Why, I dreamed the same on Monday night, and on Tuesday night, and the number was 5, 4, 3, 2. Well, I sent right to Boston on Wednesday, and purchased the ticket, and here it is; you shall keep it, Mary, and when I go up to Boston for the prize you shall be with me."

Poor Mary smiled mournfully had reproachingly. Henry left the house, and went home satisfied that he had made a right disposition of the ticket.

Day after day did Henry watch the post office, to read the first report of the drawing; but day after day passed without the desired information.

At length one of the young men was heard to remark, that Henry Bradford had shot out of the post office, as if he and received some strange intelligence.

"Mary," said Henry, "here is your father's paper, and look at the returns, No. 5, 4, 3, 2—TEN THOUSAND DOLLARS!"

Mary turned pale—the news was unexpected.

"Let's go to Boston," said Henry, "and get the money."

"The prizes are payable thirty days after drawing," said Mary, looking at the bottom of the ticket.

That night Mary told her mother of Henry's luck.

Mrs. Carver seemed rather startled.

"Are you not pleased, mother?" asked Mary; "do you wish to oppose other obstacles to our union?"

"Mary," said Mrs. Carver, "do you recollect the most uncompromising hostility which your father has to lotteries—his utter abomination of money thus distributed?—This prize will be worse to him than poverty. Ever since they refused to make him a manager in Plymouth Beach Lottery, he has set down the whole as gambling, and every prize as the devil's gift for mischief; and, to say the truth, most people begin to hold opinions with him."

"Why, mother, every body did not ask to be made a manager in the lottery."

"No, no; but the people may, like your father, arrive at correct conclusions from selfish considerations, and good opinions may become general without any special motive for change."

The next day Mary gave back to Henry his ticket, with an account of the conversation with her mother.

Henry was mortified at the result; he understood and appreciated the feelings of the "old folks," and, in any other person's case, he might have approved of it. "But what does your father want?" said Henry. "Does he suppose that the mode adopted to build churches, endow schools, and finish public works, is too impure to supply the needy purse of one who wishes to be his son-in-law? He is more nice than wise."

"My father," said Mary, "may not think himself called upon to be as particular about what concerns the public charities, corporations, or indifferent individuals, as he is, and is bound to be, in what concerns the respectability of his own family."

"But if I acquire wealth by lawful means—"

"Henry, father never asked that you should be wealthy; he thought it proper, and he makes it a condition of our marriage, that you should have some respectable business, since you have not wealth."

"And your father is right," said Henry, "but how am I to get clear of the odium of my lottery prize, I can neither see nor guess."

"Perhaps you will dream it through," said Mary archly.

"I can dream of nothing but schooners, brigs and ships," said Henry.

"Oh, if you only owned a vessel," said Mary, "I do not know but father would almost forgive its coming as a prize."

"A prize to a *privateer*," said Henry, "but not in a *lottery*."

Henry wandered down toward the wharves and unoccupied ship yards. The war allowed of little or no work among the ship builders. The hull of a fine brig lay at the wharf. She had been launched a year, and there was none to purchase her. She was too clumsy for a privateer.

"Mr. Holmes," said Henry, "what is that vessel worth?"

"She is worth twenty thousand dollars," said the owner and builder; "she cost that as she is, and she will bring twenty-five thousand the very hour peace is declared."

"Would you like the money for her at a cash price?"

"Nothing would be more acceptable.—But there are not fifteen thousand dollars in the country."

The remarks of Mary about her father's respect for a ship owner had been running in Henry's head ever since they were uttered, and he beckoned aside the owner.

"Mr. Holmes," said Henry, "I have a commission to fulfil, and, as you know I am not much of a business man, I must ask you to consider a proposition which I am about to make to you, and to answer me explicitly."

"Let me hear the proposition."

"I will give you ten thousand dollars for the brig as she now lies."

"And the time of payment?"

"Within forty days. You cannot want the money sooner; the river is frozen over, and you could make no use of the cash before that time."

Mr. Holmes turned to Bradford, and said; "You know, Henry, that I am aware that you have not the means of payment, and also that you are not a person likely to be employed as an agent in such business, and yet I have every confidence in your word."

Henry explained fully to the ship owner the state of his affairs, and exhibited to him the lottery ticket No. 5, 4, 3, 2.

"But," said Mr. Holmes, "there may be some mistake about the matter, or some failure of the lottery, by which I should lose."

Henry explained his motives and wishes, and in two hours he held in his hand a bill of sale of the brig Helvetius, which, as the papers were not obtained, he immediately re-named MARY. The condition was, that Henry was to hold the vessel for forty days, and if, within that time, he should pay ten thousand dollars, she was to be his; if not, she was to revert to Mr. Holmes, who, in the mean time, held the ticket as a sort of collateral. The bill of sale, as I saw it, bore date 5th of Feb. 1815 Henry felt like a new man. He was a ship owner in a place where that character was a sort of aristocracy.—He went day after day to look at his brig, wishing for the time to pass away for the prize to be paid; but he said nothing yet to Mr. Carver.

One evening, while Henry was talking with Mary, she asked him what he intended to do with his vessel when the forty days were up?

"Rig her, bend her sails, and then sell her, or send her to sea."

"Why, Henry, it took the whole of the ticket to buy the hull and the standing spars, and it will take half as much more to rig her and find canvass; and beside that, how can you sell her for more than Mr. Holmes could?"

Henry hesitated; he had not thought of that; but he did not doubt but it would all come right yet.

Henry was sitting the next day on the quarter rail of his brig, looking at the masts, well covered with snow and ice, and thinking of the better appearance she would make when the rigger had done his duty. At length he felt the hand of Mr. Holmes upon his shoulder.

"Henry," said the latter, "I am sorry to have bad news to tell you. Read that paragraph in the Boston Sentinel."

"CORRECTON.—The ticket which drew the highest prize in the Plymouth Beach Lottery was 4, 5, 3, 2, and not, as our compositors stated last week, 5, 4, 3, 2. We understand that a gentleman of wealth in the southern part of this town is the fortunate holder."

"What do you say to that Henry?"

"Only that the old gentleman will not say that I have the wages of gambling."

"No, nor will he give you the credit of being a ship owner," said Mr. Holmes.

"You have been unfortunate, Henry, and I am sorry for you," continued Mr. Holmes changing his tone considerably; "and regret my own loss, as I have need of the money; but as you cannot pay for the brig, you would better hand me the bill of sale, and let us destroy it."

Henry drew from his pocket the precious document and, while he examined it from top to bottom, he said to Mr. Holmes:—"This affair has been to me like a pleasant dream, not only on account of my aspirations for Mary, which you are acquainted with, but day after day I have felt a growing energy for business, a sort of outreaching of the mind, a determination, with such a noble beginning, to proceed cautiously but steadily to do what I ought to have begun years since. Then, Mr. Holmes, as the bill has yet some days to run before I can be chargeable with violation of contract, I will restore it to my pocket-book, and, if I cannot *dream* as I have done, I shall not, at least, be awakened too suddenly."

Mr. Holmes, of course, consented, as he really had no right to claim the vessel until the forty days should have expired; and Henry went up to tell Mary of the new turn his luck had taken.

Though Mary respected her father too much to feel pleasure in Henry's new possession, yet she loved Henry too much not to feel deeply grieved at his bitter disappointment.

"That dream," said Henry, doubtingly—"that dream has not yet come to pass."

Some days after there was, as usual, a gathering at the post office, at some distance from the ship-yard awaiting the arrival of the mail. The stage, at the usual hour, drove up, and the driver said, as he handed the mail-bag into the house, that he guessed there was better news to-day than he had brought since the victory on the Lakes.

"Another victory, Mr. Woodward?"

"No, not another victory, but PEACE?"

"Can you tell me," said a dapper looking young gentleman, as he slipped from the stage, "where I can find Mr. Holmes, the owner of the brig Helvetius?"

"Mr. Holmes lives on the hill yonder," was the reply, "but it is thought he does not own the Helvetius now."

"Has he sold her?"

"Yes."

"I am sorry for that—who is the owner?"

"Mr. Bradford—the young man whom you see reading the newspaper."

The stranger stopped into the house, and inquired of Henry whether he would sell the brig.

Henry said that he would cheerfully part with her.

"At what price?"

"At the peace price."

"Stage is ready," said Mr. Woodward, the driver.

"We will ride over to the village," said Henry, "and converse on the matter as we go along."

Henry soon emerged from the stage coach, and hastened to Mr. Carver's.

"You look cheerfully," said Mary.

"I have drawn another prize!"

"Not another, I hope!"

"Yes, and a large one; I have sold the brig for twenty thousand dollars to a Boston house, and I am to be at Plymouth at four o'clock, to get my pay at the bank."

"But the brig was not yours, Henry.—Surely you are not deranged—you could not hold the brig after the mistake of the prize was corrected."

"There is where you are mistaken, Mary. There is a bill of sale which allows of forty days from date for the payment. Say nothing to any one," cried Henry, "and I will be with you before I sleep."

"What's the matter with Henry?" said Mrs. Carver, as she entered the room, "has he drawn another prize?"

"I guess not, mother," said Mary; "only dreaming again, perhaps."

At nine o'clock Henry arrived from Plymouth, with an accepted draft for ten thousand dollars, in favor of Mr. Holmes, and a bank book in which he had a credit for an equal sum. The brig Mary made some of the most profitable voyages that were ever projected in Boston.

She was in the East India trade, and, as her return was noticed in the papers, (and it was usually announced about the same time that the very respectable family of Bradford had an increase,) Henry was wont to exclaim, "luck is everything."

Some years after that, twenty-five at least, as I was riding into Plymouth, with Bradford and his grand-daughter, I referred to the anecdote, and the conclusion that "luck is every thing."

"There may be something in luck," said he; "but the HOPE which I gathered while I held the ticket, with the belief that I had a prize, the resolutions which I formed while sitting and gazing at the lofty spars of my brig, and the confiding virtue, the filial piety, and the perfect love of Mary, did all for me, and I should have been rich without the brig: so you see, it was hope, contemplation, woman's virtue, woman's piety, and woman's love, that made me what I am. And let me add, friend C., that you and I owe more to woman than the world credits to her. Let us, at least, do her justice."

# Youth's Corner.

"Attempt the end, and never stand to doubt;
Nothing's so hard, but search will find it out."

For the Rural New-Yorker.

## GEOGRAPHICAL ENIGMA.

I am composed of thirty-five letters.
My 11, 4, 25, 27, 23, 31 is a country in Asia.
My 33, 29, 7, 13, 26, 16 is a city in Michigan.
My 14, 20, 5, 24, 3 is a firth in Scotland.
My 17, 35, 10, 28 is a county in Missouri.
My 9, 21, 32, 1, 2, 8, 22, 15 is a town in Upper Canada.
My 19, 12, 18, 6, 15 is a river in Scotland.
My 9, 23, 26, 30, 34 is a river in one of the Southern States.
My whole should be in every family.

Rollin, Mich., 1853. JAMES.

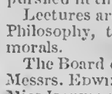
## ANSWER TO ENIGMA, &c., IN NO. 81.

Answer to Astronomical Enigma—*Aurora Borealis, the Nothern Lights.*

**Imported Horse, "Consternation."**



THIS thoroughbred horse has been so often exhibited at the Fairs of the New York State Agricultural Society, and always without a rival, that it is unnecessary either to describe or praise him. Six or seven of his colts, of various ages, were shown with him at Utica last fall. Two of them received first premiums, and all of them were greatly admired. Many of them, now four and five years old, are owned in Oneida county. Any person may be convinced of their great superiority by inquiring of almost any farmer or horseman in the towns of Rome, Lee, or Western. His colts and fillies are already in demand for breeding. Several have been sold during the past winter, at handsome prices, to go out of the State.

His pedigree will be found complete in Derby & Miller's edition of Youatt, and is confirmed in every particular by breeders' a certificates and copies of the English Racing Calendar, and English Stud Book, now in possession of the subscriber.

He will stand the coming season at the farm of the subscriber, two miles west of Syracuse and adjoining the village of Geddes.

Terms.—$10 for the season, and $15 to insure; the money to be paid in advance in all cases. When a mare is insured and left at the farm of the subscriber, or regularly returned to the horse until the groom is satisfied she is in foal, a receipt will be given promising to refund the money if the mare was not got in foal. Pasturage furnished at three shillings per week. Mares to be at the risk of owners in all respects. J. B. BURNETT,

174w8. Syracuse, N. Y.

**MORGAN HORSE "GEN. GIFFORD."**

THIS justly celebrated horse will be kept the present season at Lodi Village, Seneca Co., New York.

Gen. Gifford received the 1st Premium in the class of Morgans at Rochester, in September, 1851, and is regarded by experienced horsemen as the best living specimen of this invaluable breed;—is a perfect model in form, a sharp goer, and style and action unsurpassed. Terms of insurance, twenty dollars. CHARLES W. INGERSOLL.

Lodi, April, 1853. 164w8

**THE ACADEMY AT OVID.**

THE Summer Term of this Institution, will commence on WEDNESDAY, MAY 10th. This School is open to Youth of both sexes.

Instruction is given in both the Ancient and Modern Languages, in General and Agricultural Chemistry, in Civil Engineering, in Music, and in all branches of study pursued in the most approved Schools in the country.

Lectures are given in Chemistry, Physiology, Natural Philosophy, the Science and Art of Teaching, and on morals.

The Board of Instruction consist of Rev. AMOS BROWN, Messrs. EDWIN PIERCE, W. H. BREWER and G. B. VOSE; Miss ISABELLA MEAD and Miss ANGELINA JAMESON.

*The Gentlemen are all of them graduates of some of the best New England Colleges, and the Ladies have proved themselves to be entirely competent to their stations.*

Charges to Pupils from abroad, for *Board, Tuition, room rent, Wood and Lights*, are $2,50 per week. The charge for instruction on the Piano Forte is $10 per quarter, and $4 for French, Painting, Drawing, &c. Pupils boarding themselves, or boarding with their particular friends, are charged for tuition, $4, $6, and $7 per term, of 14 weeks, according to studies. A commodious boarding house has been provided exclusively for young ladies, where the young ladies and their lady teachers constitute one family.

Application for admission to the school and for board, should be made to Rev. AMOS BROWN, the Principal.

WILSON GRAY, *Sec'y.*

Orid, April 9, 1853. 173w3.

**SPRING GRAIN AND SEEDS.**

WE have now on hand and for sale at the Genesee Seed Store, the following Field Grains:

100 bushels Pure Fife Spring Wheat.
100 do. Barley, 4 or 6 round.
25 do. Do. superior new variety, 2 round.
100 do. Buckwheat.
100 do. Racine or Cat-tail Oats.
200 do. Reupt Timothy seed.
400 do. Common do.
25 do. Large Clover.
25 do. Red Top.
20 do. Orchard Grass.
50 do. Millet.

172-tf. J. RAPALJE & CO.

**GARDEN AND FIELD SEEDS**

*From the New Establishment of Van Zandt & Bowdish,*
No. 114 State street, Rochester, N. Y.

CAN be purchased of the merchants generally throughout the country, in Papers or Packages, on the most reasonable terms. Also at the Agricultural Warehouse of E. D. HALLOCK, No. 24 Exchange street, near the Clinton Hotel, Rochester, N. Y.

The Seeds from this establishment can be relied on as being of the very best quality. They are mostly imported, or grown by the EASTERN SHAKERS, and are warranted.—Full directions for cultivation printed on each Paper and Package. VAN ZANDT & BOWDISH.

Rochester, N. Y., 1853. 170m6.

**Pure Bred Male Stock at Private Sale,**
AT MOUNT FORDHAM, WESTCHESTER CO.,
Eleven Miles from City Hall, New York.

I WILL sell and let from 10 to 12 Short Horned Bulls and Bull Calves, 4 Devon Bulls and Bull Calves, and from 12 to 15 Southdown Rams. The annual sale by Auction will be omitted this year, as I wish to reserve all the Females, having recently purchased another Farm, to enable me to increase my Breeding Establishment. My Hog Stock, including all the Spring litters, are engaged.

Catalogues with full Description and Pedigrees of the above Bulls, and Southdown Rams, with the Prices attached, can be obtained by the 15th April next, from the subscriber, or at any of the principal Agricultural Stores, or from the Editors of the principal Agricultural Journals.

March 23d, 1853. 170m3 L. G. MORRIS.

**SALE OF SHORT-HORNS.**

I WILL sell by Auction, on Wednesday, 8th June next, at 1 o'clock, P. M., about Thirty of my improved Short Horned Cattle, mostly all the get of my imported Bull.—Up set price from $150 to $300. [169-9t*]

Auburn, N. Y., March, 1853. J. M. SHERWOOD.

MONEY TO LOAN on Bond and Mortgage, on improved farms. L. A. WARD,

[169m6.] 36 State St., Rochester, N. Y.

## MOORE'S RURAL NEW-YORKER:

A WEEKLY HOME JOURNAL,

For both Country and Town Residents.

**PUBLICATION OFFICE,**
BURNS' BLOCK, CORNER STATE AND BUFFALO STS.,
ROCHESTER, N. Y.

**TERMS, IN ADVANCE:**

TWO DOLLARS A YEAR—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion.

☞Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

**Terms of Advertising**

ONE DOLLAR per square (ten lines—100 words, or less,) for each insertion,—*in advance.* ☞The circulation of the NEW-YORKER is much larger than that of any other newspaper published in the State, out of New York city. Only a limited space, however, is devoted to advertisements, and hence preference is given to those most appropriate—such as the cards and notices of dealers in Agricultural Implements and Machinery,—Horticulturists and Seedsmen,—Booksellers and Publishers,—Inventors, etc. All orders by mail should be accompanied with the cash.

To enable us to accommodate as many as possible, brief advertisements are preferred. Patent medicines, &c., will not be advertised in this paper on any terms.

☞All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

**THE WOOL GROWER AND STOCK REGISTER.**

THIS is the only American Journal primarily devoted to the interest of Wool and Stock Growers, and should be in the hands of *every owner of Domestic Animals.* It is ably conducted, published in the best style, and finely illustrated. Each number contains a careful Review of the WOOL and CATTLE MARKETS, and much other *useful* and *reliable* information which can be obtained from no other source. The Fourth Volume commenced in July last.

TERMS:—FIFTY CENTS A YEAR; Five Copies for $2; Eight for $3; Eleven for $4. Back volumes, bound in paper, at 40 cts. each,—unbound at 35 cts., or three for $1.

Published monthly, in octavo form. Specimen numbers sent free. Money, properly enclosed, at our risk.

Address D. D. T. MOORE, Rochester, N. Y.

# MOORE'S RURAL NEW-YORKER.

VOLUME IV. NO. 20. ROCHESTER, N. Y.—SATURDAY, MAY 14, 1853. WHOLE NO. 176.

**MOORE'S RURAL NEW-YORKER:**

A QUARTO WEEKLY

**Agricultural, Literary and Family Newspaper**

CONDUCTED BY D. D. T. MOORE,

WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter—interspersed with many appropriate and handsome engravings—than any other paper published in this Country.

☞ FOR TERMS, &c., see last page.

## Rural New-Yorker.

### Progress and Improvement.

### CULTIVATION OF THE POTATO.

THE cultivation of the potato is a source of no little gain to farmers—or was formerly so regarded, when it was a sure crop. But, in consequence of the disease which has prevailed of late years so extensively, in many localities, farmers have planted fewer than formerly, and potatoes have not unfrequently borne a very high price—selling higher per bushel than Indian corn—and sometimes equalling or exceeding the price of wheat. These facts show that the potato has come to be considered as one of the indispensable necessaries for daily use.

Fifty years ago, and perhaps a little more, the cultivation of the potato excited very little interest, even in this country. English turnips, then, were extensively raised. A farmer, who gathered from five to seven bushels of potatoes in the autumn, was tho't to have a large crop. He then counted his bushels of turnips by the hundred. Since, and for many years before the "potato disease" made its appearance, the order of things was entirely reversed—the potato being considered a much more productive crop than the English turnip.

New ground seems to be the best adapted to grow the potato. If well prepared, it usually produces well, and when the crop is removed, the ground is in a fine condition for a crop of wheat, or Indian corn. The best crop of Indian corn we have seen was produced on ground which, the year before, was sward-land, upon which potatoes were planted—dunged in the hill with green stable manure. According to our observation, either new land or sward land is better for potatoes than old, mellow soil.

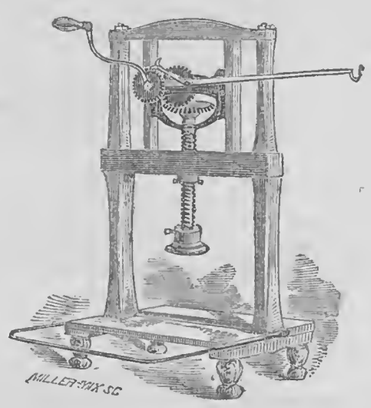
The method of preparing the soil for the potato crop is very similar to that of corn. Deep planting should be avoided. The rows should be about three feet apart one way—the other, the hills should be nearer, or more remote, according to the richness of the soil. It is better to plant whole potatoes, than cut tubers—and those used for planting should be of middle size, green and vigorous—that is, full of sap, or juice. Potatoes that were produced from late planting last year, are, it is said, the best for seed, so far as the condition of the tubers is concerned.

When manure is employed in the hill, the quantity required will depend upon the condition of the soil. Some drop the potatoes and place the manure on them, others place the potatoes on the manure. We have the experiment of a man who tried both ways, other conditions being equal. The experiment was performed with equal weights of potatoes, and so of the manure. Those placed over the manure, produced 105 lbs.—while those under yielded only 84¼ lbs.—making a difference in favor of planting on the manure, of 20 per cent.

After planting, in due time, the business of hoeing must be well attended to, if you would have a productive crop. Weeds are no friends to the potato crop, therefore destroy them while the potatoes are growing and maturing. Many farmers make it a rule to hoe their potatoes twice, and corn three times. The number of hoeings in reference to either must depend upon the ground and the weeds, rather than upon the number of times.

Many farmers pinch off the blossoms of the potato, thinking that if permitted to remain, they diminish the size of the tubers, and it is a well-known fact to botanists, that the flowers are very exhausting to the plant. The potatoes are not only made less, but the crop tends to exhaust the soil more than it otherwise would, and this will tend to diminish the cereal crop which is to follow in rotation. With regard to digging and storing, timely remarks and suggestions will be made.

The varieties of the potato are quite numerous, and we have not space now to treat of this subject—neither would all agree if we had—for nearly every variety, as various as they are, has its warm advocate for particular reasons. Every farmer and gardener should plant those he deems best, if he can get them. Potatoes when they yield well, are a good crop at twenty-five cents per bushel—and with a slight hope that they will sell for four times as much, some farmers will plant many, notwithstanding the "potato disease."—W.



HACKLEY'S PATENT CHEESE PRESS.

THE above engraving, is a correct representation of a new Cheese Press, just patented by M. A. HACKLEY, of Bellevillo, Jefferson Co., N. Y. The Press has been thoroughly tried the past season, and pronounced by those testing it as unequaled by any thing yet before the public. It combines durability and power—simplicity and convenience. By turning the crank, the screw is raised or depressed, and a pressure easily given of 1,500 lbs., which may be increased and made a continual pressure by attaching a weight to the lever. A weight of 12 pounds is sufficient for a cheese weighing 50 pounds; and 20 pound weight for a cheese of 100 pounds. The frame is used for a turning table, on which to rest the whey—board in turning the cheese; when this frame is depressed the roller is elated, and the cheese rolled in, or out of the Press, with ease.

This Press took the first premium at the State Fair, at Utica, last September, at the Jefferson County Fair in the same month, and at every Fair wherever shown. We are assured that the HOLMES' press was examined in competition with this at our last State Fair, and not overlooked as stated in the published proceedings—and that the committee unanimously awarded Mr. HACKLEY'S press the first premium.

### SAVING AND APPLYING MANURE.

EDS. RURAL:—As this is the particular time, more than any other, when farmers are commencing operations upon the farm, a few thoughts upon the saving and application of manure may not be inappropriate. I am of the opinion that no part of farm economy is so little cared for, or so little understood by farmers generally, as this very thing. We have been in the habit of plowing and cropping our land, without even a thought or concern from whence the increase should come—expecting the good Lord would send it to us from somewhere; and when it failed to come in as great abundance as to our more fortunate neighbors, we have almost charged Him with partiality,—never dreaming that we had been neglecting the very means so necessary, nay, so indispensable to the growth of our crops. Now it is unreasonable to suppose that the earth is always going to be pouring its treasures into our granaries, without ever receiving any returns back again. It has thus far been good to us, and we have drawn largely from its stores, and but little have we returned again.

When looking at this subject, I have been astonished to see how little regard is paid to it. And if occasionally some may be found who have thought upon it, and tho't some reform was necessary, even these have frequently sought for the remedy anywhere but in the right place. They have spent much money and labor in procuring abroad, the fertilizers necessary to be applied to the soil, in the shape of gypsum, guano, lime, &c., when the very thing needed, existed in great abundance and much cheaper upon their own farms. The writer is acquainted with a large wheat grower, in the interior of this State, who annually purchases manure to the amount of from $75 to $100, while upon his own farm may be seen piles of old wheat straw, in various stages of decomposition, that have been accumulating for years. And I pity the man that undertakes to wade through his barn-yard in the spring. This man fattened last fall, about 40 hogs. In conversation with him, recently, I asked him how much manure he made from them. He replied, not much. He s'posed he ought to, but it was a good deal of trouble to do it, and he had'nt time.

I would not speak lightly of the use of plaster, but on the contrary, think perhaps, more might be used to advantage than is, especially on our wheat farms. But I do protest against that careless, exhausting system of farming, practiced by many, who then, because their land does not produce as well as it once did, "get the blues," and denounce the whole business as hard, unprofitable and wholly destitute of pleasure, and embark in some other, or else sell their farm as worn out, and of but little value—move to the west, on to a new farm, to commence the same system of exhaustion, regardless that the agents of fertilization and renovation are in their own hands.

But, says one, what would you do? Answer: When you thrash your wheat and other grain, see that the straw, chaff, &c., is all safely secured in a good nice stack.—Save all your corn stalks and everything else that your cattle, horses, sheep, or hogs can eat, drink, or lie upon—secure it, for you will want it. See that your stables—and a sufficient number of them for all the cattle you keep—are in good order, with a plenty of shed room for all your sheep.—And if you have not stock enough to consume your fodder, buy it. It is bad economy to sell off your fodder and coarse grain from the farm; better feed it out on it, even if you may not receive quite as much, you will gain in the end. When cold weather comes, put up the cattle and horses in the stables, and the sheep in the sheds, with yards provided with good racks for feeding straw, and troughs for grain. Feed the straw from your stack liberally; this, with some corn, will be all the store sheep will want. The straw that is not eaten, scatter about the yard for litter, and under the cattle and horses in the stables for bedding, to be removed every morning and night, and if a plenty is used, I think there will be but little use for tanks, as the straw will absorb most of the liquid excrements of the animals.—Occasionally apply a small quantity of plaster to the manure heap, to retain the ammonia that might otherwise be carried off in the atmosphere. Provide for your fatting hogs a good pen, with a yard corresponding in size with the number of hogs to be fed.—Keep in this yard a plenty of straw, muck from the swamps, ditches, old chip manure, or any thing else that will make manure.—The hogs will root this over, and give it many turnings, incorporating with it their own droppings. This you will find the very best manure for your corn crop.

Make it a prominent part of your business to manufacture as much manure on the farm as possible. As soon as the ground is sufficiently settled to admit of it, commence to haul the manure on to the ground intended for spring crops, reserving most of it for corn. Put it all out, except the most strawy, and least valuable. This I would make into a compost heap, mixing with it muck, ashes, and plaster; and by the time you will want to sow your wheat, next fall, it will all be decomposed, without losing much of its value, and will be found very good for a top dressing for the wheat in spots most liable to be thrown out by the frost. I have found it almost a sure remedy against winter-killing. This system is one I have followed for a few years, and believe it to be a good one; and I think that, with a judicious rotation of crops, we need have no fears about our farms running out, but, on the contrary, we may increase their produce to double what it now is. C. K. W.

Le Roy, N. Y., April, 1853.

GROUP OF SPANISH MERINO SHEEP.

THE accompanying engraving was made from a daguerreotype of Spanish Merino Ewes owned by Mr. GEO. CAMPBELL, of West Westminster, Vt. In relation to these sheep, Mr. C. writes us (under date of April 20, 1853,) as follows:—"The group of ewes of which I send you a cut, are of my old Spanish stock—descended from the JARVIS and HUMPHREY Merinos. Their last year's fleeces averaged 5½ lbs. each, and sold at 52½ cts. per lb. The present season I have sheared from 30 two year old ewes, 240 lbs. 11 oz. of wool, (of only eleven months growth,) making an average of a fraction over 8 lbs. per head." A profitable yield; much more than the average of good sheep.

### MR. REDPATH'S ESSAY ON DRAINING.

A WORD TO OBJECTORS.

FRIEND MOORE:—It is well remarked by your respected correspondent, LINUS CONE, Esq., in his objections to some statements in my Essay on Draining, "that it would be exceedingly difficult to form a set of rules for draining that would be applicable to all the different soils and situations." This is the language of experience; the sentiment of a candid mind. To lay down any determinate rule or set of rules for draining, is a consummation never to be expected in the philosophy of farming. General principles, however, may be advantageously inculcated and enforced, leaving the details, in their various modifications, to be directed by the circumstances of soil and situation.

Mr. CONE, very naturally, from the data adduced, concludes that my "method of draining is based upon a system of shallow tillage." My motto is not only *drain deep*, but as Dr. FRANKLIN says, in his "WAY TO WEALTH,"

> "*Plow deep* while sluggards sleep,
> And you shall have corn to sell and to keep."

This may not appear reconcilable with the directions given under the head of *Stone Drains*, where it is said—"After the completion of the conduit, the drain is filled up to within 12 inches of the surface," &c. There is a mistake here; either a misprint or a transposition of the figures in copying; therefore instead of 12, read "21 inches," which will allow ample scope for subsoil plowing. I hold it a miserable policy in farmers, for a small saving at first, to construct drains in such a manner as to interfere with future improvements. The wise man's eyes are in his forehead; he makes his calculations not only for the present but for the future.

I have now to reconcile another apparent discrepancy, pointed out by Mr. C. He says:—"Again, the writer speaks of tile drains being laid two feet deep, and one foot of gravel or small stones placed above the tile, and then adds:—'This will allow a sufficient depth of soil above for the operation of subsoil plowing.'" The paragraph in question runs thus:—"The drains for tiles are generally cut very narrow; a tributary two feet deep, 18 inches at the top, and tapering down to 6 inches at the bottom, would be considered perfectly sufficient." (Here follows a parenthetical clause, regarding the implements for excavation, a caution to examine the tiles before their deposition in the drain, and a recommendation to add a foot of gravel or small stones above the tiles, when the soil is of a retentive nature; it being taken for granted that in such a case the drain would be dug to an extra depth, corresponding at least with the deposit of stone or gravel above the tile.) Then it is added, "this will allow a sufficient depth of soil above for the operation of subsoil plowing." It will thus be seen that 18 inches are allowed for subsoil plowing.

Your correspondent again differs with me regarding the mode of water furrowing. Now I confess that instead of any difference, I see nothing but the most perfect oneness of opinion. I allow 6 inches to be a sufficient depth for water furrows upon a ridged field, while Mr. C. recommends from 16 to 18 inches. Now, my recommendation of 6 inch water furrows is applicable to any system of tillage, deep or shallow. In the diagram of an undrained field A. A., the water furrow is dug 6 inches below the level of the ridge or parallel furrows, so as to give a sufficient fall.* It is evident that if the crowns of ridges are raised 10 or 12 inches above the furrow, even allowing the land to be a dead level, then the water furrows will stand 16 or 18 inches—which agrees with Mr. CONE'S requirement, and also allows a free passage for the water *below the surface soil*. Before I conclude, I have a word to say to my friend Uncle ABRAM DAN. His objections are threefold. First, as regards the mode of running drains; second, as regards the kind of tile to be used; and lastly, objects to my plan of constructing Turf drains.

While our dear relative admits that my essay is good in its general features, (it is only a *general essay*,) he, like a good critic,

* The advice of Mr. SMITH, quoted in page 5 of the Rural, is equally applicable to *surface* and under drains:—"Drains should always be cut 6 inches deeper than the drains running into it, that the water may have a free drop, which will prevent the lodgment of mud or sand at their junction or mouths."

takos his particular oxceptions; and moroovor, wonders that Mr. R. is so much behind the improvements of tho ago. Our wonder is mutual; wo wonder that such a sagacious person as Uncle DAN, should attempt to foist upon tho public his old and obsoleto opinions, as new discovories. Mr. R. trusts that he is at least fifty years in advance of tho so called improvements adducod by Uncle ABRAM. Hear what ono well skilled on tho subject of draining says: "Opinions differ as to the modo in which drains should run, some saying that transversed, or thoso which lio across tho field, aro the best, while others maintain that they should run longitudinally. Where tho subsoil is composed of strong rotentivo clay, and the moisture appears to come from tho ground, the longitudinal mode will be found tho bost, as it allows a froo escapo of the water as soon as it gathors." I should liko to seo the passage in tho essay that advocates any particular modo of running drains. If Uncle DAN takes his text from the plan or diagram, as I concoivo he must, then my wonder is increasod throofold. Tho only object for inserting the diagram was to exhibit a kind of modol of a draining field, for the guidance of such as chooso to map down their field operations. I gave no proforenco to any particular kind of tile, although tiles *without* bottoms aro mentioned as being laid down in the plan. Certainly, another object of tho plan is to stato the kind of tile used with or without bottoms—circular or olipticaI, as the case may bo. So much for objection second.

Lastly, whether Uncle DAN's plan for constructing turf drains is an improvement on the ono rocommended by me, I leave your readers to judge. Certainly tho idea of using a *core-bar* in constructing a drain would not imply that it could be dono either quicker or cheaper than by tho simplo but efficient ono noticed in the essay. "Theso drains," Uncle DAN says, moroover, "aro as good for marsh land as any othor kind, and much choaper." I would liko to know how Uncle DAN would pass through a quicksand, or a quagmire with theso core-bar drains of his. I supposo in such cases he would be obliged to allow his "tapering piece of wood" to remain! Truly Uncle DAN is "tho man, and wisdom will die with him." To provent such a catastropho, we would humbly rocommended Uncle DAN, *pro bono publico*, to filo up his wonderful discovory in tho Patent Office at tho city of Washington, along with the Irishman's receipt for making a cannon, viz:—"TAKE A LONG HOLE AND POUR BRASS OR IRON AROUND IT!"

Respectfully yours,
N. DAVIDSON REDPATH.

Fogo, Allegan Co., Mich., April, 1853.

## CONDENSED CORRESPONDENCE.

### The Jointer Plow, Again.

EDS. RURAL:—I notice that Mr. WILCOX, in a lato No. of your paper, in reply to O. S., says that he has learned that the Jointer is a patented article, and refers those that would manufacture it to tho patentee. Mr. WILCOX has evidently been misinformed, and tho facts in the caso are these, as I learn from the inventor and others. Mr. AARON SMITH, of Birmingham in this county, many years since invented tho Michigan Subsoil or Double Plow, and obtained a patent for the same,—and after manufacturing them for somo years, sold his right and interest to Mr. NEWELL FRENCH. Mr. S. afterwards invented tho Jointor and applied for a patent, but was refused, on tho ground (as he understood) that it was similar, or at least no improvement upon, his former invention.

It would be very difficult to conceive how such a decision could have been made, as the two work upon an entirely different principle. While the double plow turns two whole furrows—placing one above the other exactly as two seperate plows would do it, without any material saving as to cost, or doing the work any better than it could be done with two common plows—the Jointor, as before described by Mr. W., places all vegetable matter that is on the surface in such a position that tho furrow of tho plow will completely cover it.

Mr. SMITH has recently improved the Jointer by making the mould-board higher and the standard straight, or without projections as formerly, and having some small notches on the edge to fit into an iron plate to be fastened to the beam of the plow. This enables the plowman to change it readily from one plow to another, raise or lower it at pleasure, and always have it in the right position to do good work when fastened.—Mr. S. tells me, that he now intends to renew his application for a patent, but whether he will succeed in obtaining one remains to be seen.

There has been a general impression that this implement was a patented article, (and some certain ones have wished it to be so understood,) and that is the main reason why it has remained so long comparatively unknown, except in a small territory where it was first used. But there has never been a patent claimed for it, and all that have felt so disposed in this section, have been manufacturing it for a number of years.

I have been to considerable trouble to assertain the above facts, and have been thus particular in order to remove every obstacle to the introduction of what is considered by all who have used it, a most valuable implement and one that ought to have come into general use.—LINUS CONE, *Troy, Michigan* April 26th, 1853.

### New Disease Among Pigs.

EDS. NEW-YORKER:—I have a case which I wish to present to yourself and readers, in the hope of obtaining some light thereon. I have made all the verbal inquiries for which I have had opportunity, but have thus far been unable to arrive at the knowledge sought. I have seen nothing on the subject in any agricultural paper. Last season, in this vicinity many of our farmers lost nearly or quite all their spring pigs—(those coming early and designed for fatting in the fall,) though they seemed doing well and grew finely until three or four weeks old. Last year, I had two breeding sows, each of which had a fine litter about the 1st of March, and all did well until the 1st of April, when I noticed that some of the litter showed symptoms of very heavy breathing, much like the horse when he has the heaves. This would continue from three to six days, when they would die. I lost at that time some six from one litter only, from the other none. They were in separate pens. I did not know but the milk of the mother might be the cause, so I fed some of them upon pudding and milk, but I saw no difference.

This spring I again had two sows, each having fine litters, the one of eight, the other of ten pigs. When three weeks old the litter of eight began to sicken and die, affected as last year. (Their mother was related to the one which lost her pigs last spring.) The litter of ten, which was four days the oldest, remained well, until four of the others were dead, when they also began to die, and now I have left of the eighteen, four well ones, and two diseased. I would further state that they were this year in the same pen, but separated by a board partition.—If any of your correspondents can inform us what the disease is, and how it can be cured they will confer a real benefit upon the public, as all in this vicinity are interested. From what I have observed I think the disease contagious, and I hear it is on the increase.—H. B. H., *Rush, N. Y*, April, '53.

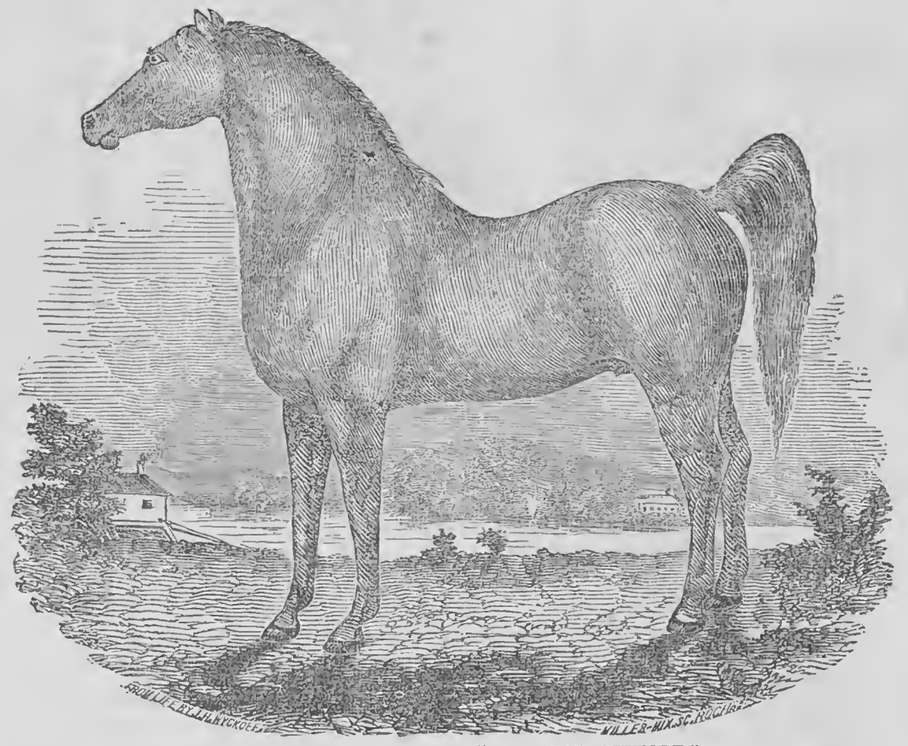
### THE PEA BUG.—(Bruchus Pisi.)

EDS. RURAL:—Soon after I commenced farming for myself, I purchased a quantity of peas for seed. On examining them, I found that about every other pea contained a bug within itself, shut out from this world only by a small piece of the skin of the pea, where the bug intended to make its exit whenever the weather became sufficiently warm for his purpose. To me, it appeared very singular how he came there, and I considered it very much like the Paddy's chipmuck that commenced his hole at the bottom and dug out. I, however, sowed my peas and watched the bugs—when the peas were in bloom, the bugs were found on the vines and in the blossoms, and when the pods had grown to their length and broadth (when they were not much thicker than a case knife,) the bugs laid or fastened their nits on the outside of the pods. In a few days, I perceived the nits had hatched, and there was a light transparent streak about half an inch in length, where the insect had eaten its way slanting through from the under side of the nit, to the inside of the pod.* The insect then fastened itself upon the pea (which had grown to about half or three-fourths of its full size,) and eat its way into it, the hole closing up after it, so that nothing could be seen of its entrance, only a small speck on the skin of the pea. Of course, it remained in the pea eating out its own cell, until it became a real bug.—SETH PAINE, *South Granby, Oswego Co., N. Y.*

*By opening the pod after the insect has eaten through it may be seen—it is white, with a black head, very small, and not more than the sixteenth of an inch long.

### To Preserve Fence Posts.

MR. EDITOR:—I saw, in your paper, lime recommended to preserve posts. But I think my plan is preferable. I prepare my posts for setting and then let them season. I then take coal tar and paint them with three coats of the same. I paint the post from about four inches above where they set in the ground to the bottom, and the end that sets in the ground also,—putting the paint on hot. A gentleman informed me that he had known a fence set in this way, that had stood forty years, and was as permanent then as at first. I think this way is much easier and cheaper than lime, and more durable.—E. H., *Fulton, N. Y.*



THE MORGAN STALLION, "GENERAL GIFFORD."

## AGRICULTURAL INTELLIGENCE.

### Orleans County Agricultural Society.

THE Plowing Match of this Society will be held at Gaines, on the 1st day of June next, at 10 o'clock, A. M. under the direction of the Executive Committee; and at the same time and place there will be an exhibition of Stallions, Bulls, Rams, and Plows of all kinds.

Each competitor is required to plow one-fourth of an acre of sward land in 75 minutes—the furrow to be not less than 8 inches deep and 14 in width, if more than one span of horses or yoke of oxen be used—if but one span or yoke, not less than 7 inches deep and 11 in width.

The judges of the plowing match are Barnuel Farr, Lyman Bates, Gardoner Goold, Jacob Indon, Jno. Millard, Cyrus Clark, A. Coon, Robt. Clark, and David N. Hatch.

The Committees are as follows:

On Stallions—Moses Huff, Oren Scoville, David N. Hatch.

On Bulls—Hamilton Miller, Cornelius Colo, Nelson Clark.

On Sheep—Stephen S. Jewett, Oren Scovillo, Asahel Byington.

The premiums will not be awarded until the second day of the Annual Fair, which is to be held the 29th and 30 days of September, 1853. The stock exhibited at the plowing match, if intended to compete for premiums, should also be exhibited at the Annual Fair..

THE *Connecticut* State Agricultural Society has now been fully organized and the friends of Agriculture throughout the State manifest a lively interest in its welfare. The Executive Committee at a meeting held in Middletown on the 19th ult., decided to hold a Fair next Autumn; and to offer premiums to the amount of at least $3,000. The place of holding the Fair is not yet determined.

THE *Wyoming Co.* Agricultural Society has given notice that the next annual Fair, will be held in the town which will raise the most money, aside from memberships, for the benefit of the Society, on or before the 1st of June ensuing.

### Monroe Co. Plowing Match.

THE Agricultural Society of this County will hold their annual Plowing Match at Churchville, on the 26th inst.

The Officers and Committee will meet at the Railroad House at 10 o'clock, A. M.—Plowing will commence at 12 o'clock precisely. Each Team will be required to plow one fourth of an acre, in one hour and a quarter. Each Plowman will be required to drive his own Team.

PREMIUMS.

*First Class Plows.*—To be drawn by two or three horses, and cutting a furrow 15 inches wide and not less than 8 inches deep, those coming nearest to the prescribed furrow to be considered best, other things being equal.

First Premium, $6; Second, $4; Third, $3; Fourth, $2; Fifth, Vol. Trans.

JUDGES—Alfred Fitch, Riga; Moses Pettingill, Ogden; Isaac Moore, Brighton.

*Second Class Plows.*—Furrow 7 by 12 inches.

First Premium, $5; Second, $3; Third, $2; Fourth, Vol. Trans.; Fifth, Vol. Am. Inst.

JUDGES—Edwin Taylor, Sweden; George Shefer, Wheatland; Ephraim Kellum, Riga.

*Third Class Plows.*—Boys of 18 years of age and under. To this class one hour and thirty minutes will be allowed.

First Premium, $4; Second, $3; Third, $2; Fourth, $1; Fifth, Vol. Trans.

JUDGES—Joseph Harris, Rochester; J. G. Ramsdell, Perinton; J. K. Beckwith, Brighton.

The Society will appoint competent Committees to examine and report upon all superior Horses, Cattle, Sheep, and Agricultural Implements, with power to award honorable mention prizes. Contributions to this department are solicited.

## THE AGRICULTURAL PRESS.

### Morgan Horses.

IN connection with the above portrait of a superior specimen of the Morgan race, the May number of the *Wool Grower and Stock Register* gives the following article:

PURSUANT to the suggestion made in our last number, we now offer a few remarks in relation to the breed of Morgan Horses. Above we give a portrait of "Gen. Gifford," one of the finest specimens of this celebrated breed.* This stock is so well known, and has deservedly obtained such great celebrity, that it is superfluos almost to say a word in its commendation. There are several leading and prominent sires of this breed, that have attained an almost unrivaled reputation. It is not our purpose to institute any comparison between them, in designating the one we have prefixed to this notice. Our object is to direct the attention of the farmer who wishes to raise market horses, as pleasure horses and roadsters, either for city or country use, to this celebrated stock. A good judge,—one who understands the fine points of what is correctly styled, a just made horse,—will see at a glance, in the portrait here presented, a very perfect model. And perfect as it is, it is no flattery to the original, nor to several others of this noted breed.

To the admirer of fine horses,—the breeder, who feels satisfaction in tracing back the blood of his stock thro' a splendid ancestry for an hundred years,—it is to be regretted, that the remote origin of this stock should be clouded in obscurity.—True, it does not affect their intrinsic value; but it would add greatly to the gratification of both owners and patrons, to trace their origin to the Godolphin Arabian. It hardly admits a peradventure, however, that the blood of the Arab flows in their veins. Every circumstance of form, size, action, spirit and endurance, unite in establishing this opinion. And we repeat the regret, that, through the heedlessness and indifference of former breeders, the line of their remote ancestry cannot be traced.

We hear of no objection to the Morgan horse, except on account of size. Now, we do not consider this objection well laid. We do not want horses of 16 hands, and 12 to 1400 lbs. weight for saddle horses and for single harness. For coach horses, such would be the mark. But for the saddle, the single harness, and for double harness before the light family carriage, horses of 15 to 15½ hands, and full built, are precisely the article needed.—Horses of this stamp are more active and sprightly, and will do as much ordinary work for the farmer, and do it quicker and with less expense for support, than horses of 16 hands.

It is surpising how injudicious or inconsiderate some farmers are, in the choice of brood mares. From a tall, long-bodied, long-jointed and flat-sided mare, bred to to the compact and close built Morgan, the farmer expects a colt in every desirable feature equal to the sire. This expectation cannot be realized. A brood mare should be selected, as nearly perfect in all her proportions and desirable qualities, as practicable. If deficient in some particular in which the sire is perfect, this deficiency may be expected to be remedied. Where any objection to the Morgan is entertained on account of size, it can be easily removed by selecting mares of good forms, but rather larger than the middling size. For the objects and purposes suggested above, we recommend, unhesitatingly, this stock, to the consideration of the breeder of valuable horses.

*"Gen. Gifford" is considered by connoisseurs fully equal, and by some superior to the far-famed Morgan horse "Black Hawk," whose services command $50 for insurance. His sire, of which he is adjudged an improved pattern, was pronounced by a son of the owner of the horse from which the race of Morgans descended, "very closely to resemble the original Morgan horse—not only in size, shape, style and action, but in most other particulars, except color." See Albany Cult., Vol. IV., page 157-8.

### The Cultivation of Tobacco.

IN answer to several inquires on this subject, we copy the following from the *Journal* of the N. Y. State Ag. Society:

THE sample is from a field of five acres, of very uniform growth. Soil a sandy and gravelly loam, with a free dry subsoil. The field, as I have been informed by a former owner, was well manured for a single season, some eight years ago, with stable manure, and planted to corn. Since then it has been cropped to wheat, oats, &c., having been constantly under the plow, without additional manuring, except the use of plaster. In 1850 it was sown to Spring wheat, the field very foul with *quack*, and crop light.

1851.—Plowed last of April six or seven inches deep, and followed with the sub-soil plow, loosening the bottom of the furrow six or seven inches in addition. Harrowed, and left the field at rest till the fore part of June, when about one hundred one-horse cart-loads, principally of horse manure, (or twenty loads of twenty bushels per load per acre,) were spread, and covered with a two horse wheel cultivator. There were mixed with the manure about ten bushels of plaster, twenty of lime, and fifty or more of ashes. The plaster and ashes were spread over the heap to prevent the escape of the gases, the manure having been gathered and piled up during the spring—while the lime was mixed with the coarser portions to hasten decomposition. By the subsequent shoveling to and from the cart, these substances are supposed to have been generally diffused through the mass, and evenly spread over the field, which gave a dressing of lime, plaster and ashes, of about twenty bushels to the acre, in addition to the manure, and combined with and preserving some of its best properties.

Large quantities of *quack* roots were loosened by the cultivator, which were raked into winrows by a wire-tooth horse rake, and carted off the field. This process was repeated, the second time crossing the field diagonally to the first. The cultivating, &c., effected a triple purpose—freeing the field in some good measure of what to most farmers is considered a formidable enemy, the *quack*—thoroughly incorporating the manure with the soil at a depth suited to the early and greatest benefit of the crop—and leaving the surface well pulverized, and in a fine condition for planting. This fine pulverization of the soil I consider as effecting no inconsiderable part in the final result.—The subsoil plowing, too, appeared to have been highly beneficial.

Planted from 15th to 25th of June; hoed twice, thoroughly running the cultivator between the rows at each hoeing, and going over the field a third time with the hoe, to cut out the weeds and grass that had escaped the regular hoeings. Cut and housed from 10th to 20th September. The exact amount per acre is not ascertained, as the leaf has not been taken from the stalk. It was estimated, however, by those familiar with the culture, that the crop would yield eighteen or twenty hundred pounds per acre. Nor has any detailed account of expenses been kept; but estimating the cost by the same authority, at $45 per acre; and also the value at $8 per hundred, which is said to be the average price, though last year the crop sold at $10 and upwards, and the proceeds would be $144 per acre, or affording a profit of $99 per acre, including use of land.—THOMAS A. SMITH, *Syracuse, N. Y.*

## "KNOWLEDGE IS POWER" TO THE FARMER.

To no class, no avocation, is the maxim that "knowledge is power," equally true, equally applicable as to agriculture. Its importance may be estimated by the loss which its absence entails. Physically there ensues its want, bad husbandry, specially and generally, bad crops, with a certain and rapid deterioration of soil, till, by the lapse of one generation it becomes next to worthless. Morally, its want places the husbandman far, very far, below his level in the scale of society. He who should have every thought elevated and refined by the study of nature, by "looking through nature up to nature's God," is found giving place to the artizan, mechanic, professional man—in short, to every other more enlightened calling. Politically, the want of knowledge deprives him of influence, of power. Tillers of the soil are the chessmen for the more knowing ones to play with.

Love of power is said to be innate. If, then, the farmers of our land desire power, moral physical, political power, let them *dig deep* for knowledge. This will ensure them power, influence and wealth.—*Ezra Walker.*

## DEEP TILLAGE.

BY deep tillage, says Mr. Walker, a larger body of earth is rendered permeable to rains, a greater amount of water received and retained as moisture for grain-crops, which have thus maintined within their reach a more equable supply of this element so important to the rapid development of their physical structure. The same mechanical means also, gives freer admission to the air, and to that manna of the vegetable kingdom, the nightly and refreshing dews.

Not only is the soil, by deep tillage, rendered more porvious to, and retentive of, moisture, it is also made more penetrable to the genial rays of the sun, by which it is earlier brought to a temperature suited to the vegetation and growth of crops. And it follows that, as the quantity of earth thus acted upon, is increased, it will longer retain the temperature, thereby preserving the crop from retardation and injury by the sudden changes of weather in early Spring. It may reasonably be expected also, that the same cause, increase and equality of heat, will secure the crop more vigorous growth, and earlier and more perfect maturity.—*Farmers Friend.*

MR. WARD'S DURHAM BULL.—In consequence of the many letters received by DANIEL WARD, Jr., of Le Roy, making inquires relative to his Durham bull recently advertised in this paper, he asks us to say that, "his color is cherry red; weight when twelve months old, 980 lbs., and is of the stock of the old imported Durham, "Defiance."

### WASHING SHEEP.

This is a branch of sheep economy which is wholly indispensable. The careless and slovenly manner with which it is performed by the great majority of American wool growers, calls for severe reprehension; the evil consequences resulting from it, however, are inflicted mostly upon themselves.

The most suitable time depends upon the latitude and season; the latter causing sometimes, in the same locality, a considerable variation. At all events, the flock-master must be sure of one thing, namely, that the water and weather are comparatively warm. The violation of this is very common, which is exceedingly cruel and inhumane, and often exposes sheep to disease.

The day selected should be one of sunshine, if possible; and as this work in the Northern and Middle States is commonly attended to from the 10th to the 25th of May, it will rarely be the case, at that season, that the water will be of the right temperature before nine or ten o'clock in the morning; and when only a few sheep are to be washed, it will be better generally to delay it until the afternoon.

If the washing can be conducted immediately after a warm rain it will be easier, the effect of it being to soften and loosen the dirt; in this event, the yearlings should be selected first, as they are generally the filthiest.

The flock-master should always be present; and if he does not possess the physical ability or inclination to "bear a hand," he should at least see that everything goes off properly, and is conducted on "temperance principles," for rum has done its full share of mischief on such occasions. He should be provided with a pair of shears, and if any dung locks are seen, they should be severed before the sheep are put into the water.

Where there is a running stream of pure water, with a gravelly or stony bottom, no better mode can be adopted for wool cleansing, and none other is so economical. * * *

As to eradicating *all* the dirt from the external surface of wool when upon the sheep, it is not expected, for it is impossible to accomplish it; and therefore it must necessarily be left to the cleansing process of the manufacturer. But that much more can be extracted than is usual, cannot admit of a doubt; and if a general trial will only be made, those who undertake it will be sure to succeed, and rewarded not only with the grateful thanks of manufacturers, but a handsome advance upon the prices of their wool. * * *

Bucks, especially of the Merino breed, require an extra time to wash them, and if a little soft soap should be used, their fleeces will not lose anything in value in the estimation of the manufacturer.

After the washing is completed, the sheep should be turned upon a thick-covered sward, that no dirt may collect on the fleeces, before they are shorn. Driving them along a dusty road must be avoided, if possible, when returning from the washing.

The Spanish custom is to cleanse the fleece with soap, after it is shorn, the grease or yolk abounding to such a degree, with its concomitant dirt, as to preclude the possibility of cleansing it properly in the ordinary way.

In England, the breeds having less of gum than others, washing is comparatively easy, and, where practicable, is done by swimming the sheep to and fro in a pond or stream, and gently squeezing the wool with the hands.

The washing of Saxony sheep in Germany and other parts of the Continent, conforms to the better modes adopted in this country, but is performed with far greater nicety and care.—*Morrell.*

### Sour Food.

Cattle fed on sour food, prepared by fermenting rye flour and water, into a kind of paste, and then diluted with water, afterwards thickened with hay chaff (that is, hay cut small,) are said to fatten quickly. This plan is adopted in France to a considerable extent, and has been introduced years ago in this country. Although not generally adopted, it is deserving of consideration by graziers. With respect to the efficacy of acid food for fattening animals, there is, as on most other subjects, a variety of opinions. It is well known that swine derive more benefit from sour milk than they do from milk in a fresh state; and there is no doubt but there are particles which promote digestion and facilitate the consumption of a larger quantity of food, and consequently expedite the fattening of cattle.—*Agriculor.*

Horn Distemper.—*Another Remedy.*— In the April No. of the Stock Register, a remedy is given for this disease by cutting the tail, boring the horns, &c. This I have tried; but a cure can be effected much sooner and with far less trouble, by putting one table-spoonful of whiskey in each ear of the animal. If whiskey is not at hand, alcohal, or brandy weakened one half with water, will answer nearly as well. I have tried this several times, and have known it tried by neighbors, always with success.—J. G. Burritt, *Moreland, N. Y.*

Kidney Complaint in Horses.—A correspondent of the Maine Farmer says:—"If any one inquires of you what will help or cure a horse that is troubled with the kindey complaint, or stoppage of the water, you can recommend fir bark, with the blisters or balsam attached to the same. Steep the same thoroughly, and give the horse one or two quarts of liquor, or mix it with oats and meal, and give. I have tried this remedy and never had it fail."

Lice on Cattle.—"J. R." summarily disposes of a question asked through the Valley Farmer—viz., "What will kill lice on cattle?" He says: "There are two good remedies—one, grease rendered from old, rancid bacon, rubbed on well; the other, a plenty of corn and good timothy hay, and salted regularly."

## Orchard and Garden.

### TAKE CARE OF YOUR OLD ORCHARDS.

It *will* pay, if the thing is rightly done. I have had some experience in the business on my own premises, and feel well satisfied with the result. A good apple tree, or rather a tree that produces good fruit, takes up no more room than a tree that is worthless. There is an old apple tree standing in the corner of my door-yard, which, eight years ago, I considered the same as worthless, (producing fruit that was scarcely worth the picking,) which now produces as fine Greenings as any in market, and it has done so for four years past. The tree is large, the body being about three feet in circumference. The first year that I commenced operations upon it, I inserted nearly one hundred scions, the majority of which lived; the next year cut off the remaining branches, and put in about half as many more.—The grafts lived so well, I was obliged to cut off a considerable number; and I now have a wide spreading top, in a thrifty condition.

The fact has been clearly proved to my mind, that it is as good economy to expend money in improving *old* orchards, as it is to grow young trees. To substantiate this statement, I will briefly mention what I am personally knowing to. Some ten years since, I was called upon by a neighbor of mine to go and set a few scions in some old trees, that bore a poor quality of fruit. He said his object was to see if there was anything to be done to improve his old orchard. The first year I grafted some two or three trees, around which the owner spaded up the soil to the distance of ten or twelve feet each way—applied a good dressing of manure, and planted the same to potatoes.—The next year he called on me again to graft a few more trees; the first grafted looked so promising he would experiment a little more. This year some ten or twelve trees were grafted, and treated around the roots in the same way. Thus he has continued to do from year to year,—and now has the gratification of witnessing his old trees transformed into a thrifty, growing orchard. Last fall handsome grafted fruit was gathered from this "old orchard" sufficient to pay all expenses.

What has been done may be done, and it would be good economy for farmers to "try the experiment;" give one or two trees a fair trial *this year*, and wait the result. As Poor Richard say says—"A penny saved is worth two-pence earned." A. Todd.

Smithfield, R. I., 4th mo., 1853.

### "THE SPRING BEAUTY."

This is one of the earliest of our native blossoms and for delicacy of tint is rarely surpassed. Most truthfully is it named "The Spring Beauty." There are two species, one of which is more common than the other, and the flowers of which are not quite as gay. They belong to the genus *Claytonia*, named in honor of John Clayton, a botanist of Virginia. This genus is classed under the natural order of Portulacacea or the Purslanes, distinguished for their succulent fleshy leaves.

The roots are tuberous and are placed below the surface as far as the plants rise above. It is a delicate plant, found in woods, especialy in their margins, and among rocky hills, and where the ground is somewhat moist. The stem rises from two to three inches high, with a pair of opposite leaves about midway, between which rises the stem bearing a cluster of flowers which are whitish, or tinged slightly with red, and most beautifully penciled with delicate purple lines. The leaves are one and two inches in length and about one-fourth as wide.—This is the *Claytonia Caroliniana*, which is the most common, and is found from Canada to Carolina and west to the Mississippi.

The *C. Virginica*, is more slender and found in moister soil, the leaves being longer and much narrower. The flowers are more rose colored, with deeper colored penciled lines. It is more common in the middle and Southern States, though occasionally found elsewhere. The tuberous root is longer and is deeper in the earth. They blossom in April and May and remain in bloom some two or three weeks.

They are, for their delicateness and early blossoming, treasures for the shrubbery or garden. From their habits and nature, they may be quite readily transferred to the garden, and made to flourish too—though the writer of this has made no experiment to that end. They certainly would flourish, if their new situation was made to conform in a measure to their natural habits. Under the protection of the shrubbery, they might add much to the beauty and charm of the yard. T. E. W.

Concealed buds may be started by making a nick immediately above them with a knife. A good way to form new limbs.

### SPARE THE BIRDS.

Yes, kind reader, "spare the birds!"—There is nothing you can do that will so well reward you, as to do all in your power to preserve the birds. I never allow any birds to be molested upon my farm, if I can prevent it. I love to see them in the trees about my house. It is very pleasant to watch them build their nests and rear their young. And sweet, indeed, is their music in the early morning. Their early songs ever remind me of my own unthankfulness each morning to the good Lord who has so long protected, preserved and blessed me. He careth for them, and when His blessed light first greets them, they pour out their sweetest and most joyous songs of gladness. I offer my humble prayer and thanks, but they seem to me very poor when I compare all that has been done for me and mine, with the little birds.

Last summer, just as my cherries began to ripen, the cherry birds came upon my trees in flocks, and very suddenly. It was Sunday, and as I could not allow them to be killed on that day, I took all sorts of pains to keep them away. But my labor seemed to little purpose, and I was quite disposed to have war declared upon them the next day. When Monday came, back came the birds. Still I did not like to have them shot, and made up my mind that I would divide with them. While watching the little rascals plunder my fruit, right over my head, I noticed that they never took the whole of the cherry. This led to further investigation, and I soon discovered that they never disturbed a sound cherry—and none but those that had worms in them. I gave directions that they should not be disturbed, and walked away a wiser and I trust a better man, for the lesson was an instructive one. I have never yet seen any bird take a sound cherry, and I am glad to see the birds among the fruit. Spare the birds and they will destroy millions of your worst enemies—the insects.

I keep on good terms with the crows, and never allow them to be disturbed. And I never put up *scare crows* about my corn.—After planting I scatter a few quarts about the field, which satisfies them of my good intentions, and they never pull my corn up as they do that of some of my neighbors.

There is a pair of robins that come every spring and nest in a fir tree, near the house. Last year they raised two broods, and when they came back again this year, (I am quite sure they are the same pair,) it really seemed like meeting old acquaintances. I would not have them harmed for any money. The blue-birds have come back to their box, but I fear those busy-bodies, the wrens, when they come back will drive them out, as they did last year. But I shall put up another box, and they may not disturb them.

My dear friend, be you old or young, do all in your power to save the birds. You will never have cause to repent your kindness. If flowers are God's smiles, surely the birds are His winged messengers of love and mercy to man. T. C. Peters.

Darien, N. Y., May, 1853.

### STRIPED BUGS.

To keep them from young vines, put a box around the hill; three shingles, five or six inches wide, are enough; make a letter A with them, and fasten them up with dirt or sticks. Notice, and you will see that the bugs fly in straight lines and near the ground, and besides, they cannot stop in their flight and let themselves down on the plant, as a chimney swallow lets himself down into a chimney, so that they will fly over the tops of the boxes and light upon something on the other side. If they start up again, they will fly over the tops of the boxes and light upon something on the opposite side. Occasionally, if the boxes are very low, this lighting place will happen to be just inside of the box, but not very often. I have driven off a great number from a hill and put a box around, and only one or two bugs got back again. There is no need of killing the bugs; simply drive them off and put on the boxes, or put them on before they come. You do not put covers over the tops; put small open boxes round with the sides high enough so that when you stand ten feet from the hill you cannot see the plants, and then the bugs flying cannot see them, and consequently will not know where the plants are so as to light upon them. Do not make the boxes too high, for that will shade the plants; nor too low for then the bugs will see the plants and light upon them—they will fly straight to them.

I have been twelve years in making observations upon this insect, and have used the box for that time, but did not discover *why* the bugs did not get in, till last year while in Waltham, Mass. In a garden there where I introduced the box I found that they did not get in because they could not. I know of several who have used the box for a long time with success.

A good protection for radishes, onions, and such roots as suffer from a small white maggot, is to keep the earth that comes immediately in contact with them drenched with tobacco steepings. If carefully and constantly attended to, it will invariably prove successful. The box is no protection unless covered. The maggot is deposited by a small black fly, that disappears in season for the roots to come to maturity if protected till they are partially grown. One pound of tobacco, at 8 cents, will be strong enough for five or six pails of water. Nothing but tobacco worms and men can endure tobacco.—*Eastern Mail.*

### HAVE WE A BLACK KNOT AMONG US?

No doubt, a very prompt and feeling answer will be rendered to this inquiry, by many of the proprietors of the fine gardens in Cambridge, as they contemplate the sorry plight of their once valuable plum trees.—We have heretofore raised a warning voice on this subject, and have regretted that so little heed has been accorded to it. Here and there, however, we are happy to say, may be found a proprietor whose trees are entirely free from this disease, and such persons uniformly bear testimony to the fact that, by constant attention to cutting off and burning the diseased parts, at any and all seasons of the year, a cure is effected. To all whose trees are affected, we say, see to them at once, before the knots are concealed by new foliage, as they will then elude the strictest search, and where they are too far gone to make trimming of any avail, cut them down at once, and relieve yourself of a disagreeable sight, and your nighbors' trees from contagion.—*Cambridge Chronicle.*

## Mechanic Arts, &c.

### LIST OF PATENT CLAIMS

ISSUED FROM THE UNITED STATES PATENT OFFICE

For the week ending May 2, 1853.

Robert Adams, of London, England, for improvements in revolving fire-arms. Patented in England, Feb. 24, 1851.

Richard L. Hinsdale, of New-York, N. Y., for improvement in elastic exercising machines.

Geo. Kendall, of Providence, R. I., for improvement in mould candle apparatus. Patented in England, Nov. 12, 1852.

Daniel Reid, of Washington, N. C., for improvement in manure carts.

Geo. W. Reid, of Evansville, Ind., for improvement in corn shellers.

Paris J. Steere, of Cheshire, Mass., for improvement in machines for sawing barrel-heads.

James S. Taylor, of Danbury, Conn., for improvement in machines for shrinking hat bodies.

Chas. N. Tyler, of Worcester, Mass., for improvement in repeating fire-arms.

Samuel R. Wilmot, of New Haven, Conn., assignor to Joseph Kent, of Baltimore County, Md., for improvement in apparatus for drawing water from wells.

Patrick O'Reilly, of Reading, Pa., for improvements in rails for railroads. Ante-dated Nov. 3, 1852.

J. Dutton Steele, of Pottstown, Pa., assignor to Chas. E. Smith, of Philadelphia, Pa., for improvement in rails for railroads. Ante-dated Nov. 3, '52.

DESIGNS.

Jas. L. Jackson, of New-York, N. Y., for three different designs for grate frames.

Jas. L. Jackson, of New York, N. Y., for design for a grate frame and summer piece.

### CHEAP AND GOOD OUTSIDE PAINT.

Friend Moore:—I have noticed from time to time, in the New-Yorker, remarks relating to various kinds of "Mineral Paints," "Hard Finish," "Mastic Cement," etc., and the modes of preparing them, to be applied to various structures, both internally and externally.

Will you permit me, to call the attention of your numerous readers, to an entirely new compound, very superior, as well as cheap, for painting the *outside* of any building. Superior, because of its durability,—possessing the power to resist the action of the elements for a number of years. Cheap, because the expense, when compared with lead, is but a trifle.

Take two parts (in bulk) of water lime *ground fine*, and one part (in bulk) of white lead ground in oil. Mix them thoroughly, by adding first quality of boiled linseed oil, sufficient to bring the mass into a state suitable to be passed through a paint mill. After passing the compound through the mill, temper it with oil, bringing it to a proper state to be applied with a painter's brush.

This, when applied, will form a coat which will be found in its place, and protecting your building, when the white lead which your neighbor applied to his, will be seen to have descended, to whiten the earth, stone and grass, and, if he chooses to continue the use of lead only, he will have the pleasure of repeating its application many times, while yours retains its place and beauty.

This cement may be tinged to suit the taste, with any of the coloring matter in use by painters, or the proportions may be varied by using less lime, the *two parts* being the extent of lime in forming the composition.

In painting the cornice of a building, I reversed the proportions, using two parts lead, and one part lime, thus forming a rich tinge resembling light cream color. Five or six *shillings* worth of lime, will go as far as twenty or twenty-five *dollars* worth of lead, and when prepared as above will last three times as long. Henrietta.

### A MACHINE FOR REPORTERS.

We find the following article in The Randolph Whig:

In September, 1850, John B. Fairbanks, Esq., then a resident of this county, now of New York City, took out a patent for an invention calculated to enable a man who can move his hands rapidly in a vertical direction, to report a speaker in full, with ease and certainty. It is operated by keys, which by their movement, connected with stenographic type, imprint a new alphabet of short-hand characters upon the paper.—The alphabet contains only five elementary characters, and by combinations of these, all the other letters, together with numerous word-signs, are made. The fingers and thumb of one hand are sufficient to operate five keys, which constitute the alphabet, and to make innumerable changes upon the same, so that one hand can write one row of signs upon the paper, while another set of five keys under the hand can, at the same time, be made to write another one. It is really gaining the use of both hands at once in writing stenography, and the hand will certainly not so soon grow weary of simply striking these keys, as of constantly pushing a quill, which to those who have tried it well know is worth all it comes to. We have been shown one of these machines, which is now in the office of Mr. Thomas P. How, who is associated with Mr. Fairbanks, and is at present in our village—being the first one completed, as Mr. F. informed us. It is a difficult matter to judge as to the practicability of the invention.—It is a curious and ingenious contrivance, and it is certain that it will write very rapidly in the hands of one who knows the alphabet perfectly and can operate the keys with facility. Here we apprehend will be the difficulty—to enable a person to gain so complete a mastery over both the new alphabet of characters and the handling of the keys, as to work the machine without any hesitation. But probably perseverance would overcome these obstacles. Messrs. Fairbanks and How have now in process of construction an improvement upon this invention, calculated to write out a speech in Roman characters, instead of short hand.—For a sketch reporting this would be admirable, as the "copy" would be more complete and easier for the compositor. They have taken measures to secure a patent, and have drawings of the improvement, which look as if it would be successful. We hope it may.

### COPYING AND PROPORTIONING MACHINE.

Mr. James Miller of this city, an ingenious and active mechanic, has invented a machine which copies with the most perfect accuracy all linear designs and exactly proportions the copies which it makes, either to a large or smaller scale. The machine is of simple and beautiful construction, and is intended to reduce or increase the size of patterns for calico printing, and carpet weaving. Copying machines have already been invented, but the want of one that would both copy and proportion has always been felt, which Mr. Miller assures us his does so with the most perfect mathematical accuracy. We saw the machine in operation. It copied and reduced a map of Great Britain which seemed to us to be beautifully executed. The machine, it seems to us, will be highly valued by manufacturers of carpets, paper hangings, and printers of calico, &c. We hope the ingenious inventor will be duly rewarded for the thought and labor he has expended upon this machine.—*Worcester Spy.*

### IMPROVED FLUID BURNER.

Measures to secure a patent for improvements in the above have been taken by Samuel F. Allen, of New York City. The improvement consists in employing, in place of the ordinary lamp, a large fluid vessel or reservoir, which is to be filled with sufficient fluid to last a long time, and set at some suitable and safe distance from the place where the combustion of the fluid takes place and in such a position that the fluid, in finding its level in the wick tube will not rise higher than the top of the horizontal flame tube. The communication between the two is maintained by a flexible tube which thus supplies the latter with fluid for combustion, and a screw nut is fitted at the bottom of the wick tube which serves as a stand for the latter, and can be taken off when a fresh wick is required. To prevent the wick from burning away too quickly it is encased in a wire gauze which also serves to render the light more brilliant by supplying the fluid in a broader jet or stream.

### FRIED POTATOES.

Boil some potatoes in their skins; when cold, peel them and cut them in slices, quarter of an inch thick; put a large tablespoonful of lard or beef dripping into a frying pan, and set it over the fire; add pepper and salt according to the quantity of potatoes, (a teaspoonful of salt and a saltspoonful of pepper to a dozen small sized potatoes;) when it is boiling hot, put in enough sliced potatoes to cover the bottom of the pan; as soon as one side is a delicate brown, turn the other; when both are done, take them into a hot dish; then fry more: when all are done, put to them a little of the fat in which they were fried, and serve.

Care is necessary in frying potatoes that they are nicely and delicately browned, without being burned or cooked to a crisp; for breakfast or supper, fried potatoes are much liked.

Potatoes may be fried with less time or trouble thus:—Peel them and chop them small; make some lard hot in the pan; add salt and pepper as before directed, then put the potatoes in; turn them that they may be nicely browned. Serve in a covered dish.

# MAY SONG.

WORDS BY MISS M. F. MORGAN. MUSIC BY T. H. BOWEN.

# Sunday Reading.

## 'TIS NOT ALL SADNESS.

BY MRS. A. C. JUDSON.

No! Life is not *all sadness*,
'Tis not all clouds below,
For there are rays of gladness
To lighten up our wo;
Then take the sunshine proffer'd,
And cast away thy gloom—
Why wear, when joy is offer'd,
The shadows of the tomb?

Come, cheer thee—Hope is flinging
Its blossoms o'er thy way;
And fragrant flowers are springing
Like summer's joyous day:
And Friendship's wreaths have bound thee,
All pure, and fresh, and bright—
While Love hath thrown around thee
Rays like the morning light.

Away then with thy sadness,
And let thy brow be clear;
O turn that heart to gladness,
And dry the falling tear,—
Seek round thee for the brightness,
And look not for the gloom;
Then thoughts will come with lightness,
Fresh as the roses' bloom.

Thus will thy life be longer,
Its ills not half so keen,
Thy mental powers be stronger,
With Hope to gild each scene—
And all around will bless thee,
The aged and the young—
Smiles on the lip caress thee,
And praises on the tongue.

Written For the Rural New-Yorker.

## SABBATH MUSINGS.

It is a quiet, beautiful, sunny morning. The soft, delicious air of spring, comes breathing round me, like a gentle spirit. I have wandered forth to muse, and to enjoy the holy calm, and as I linger here on this green hillock, and cast my glance upon the world around me—sleeping, so peacefully in the holy ray of morning,—I fain would be as the child; unconcious that this fair, this beautiful earth, is the abode of sin and sorrow! Yonder meadow-lark, as he mounts upward into the celestial blue of Heaven, has naught but melody and gladness in his song,—the murmur of winds and waters, sends a sweet thrill of pleasure to the soul, and Nature's thousand music voices are as glad and harmonious as when—

First in Eden's bowers they blent
On those winds of softness sent,
Breathing music, low and thrilling,
O'er the flowers their sweets distilling,
And with grateful, glad accord
All arose to praise their Lord.

And man, in his nobleness and integrity stood up, and in the midst of that fair creation held sweet communion with his Maker! Stood up! and from the paradise around him, gazed upward into the sky, and fearless, talked face to face, with the Almighty God!

Ah man!—fearful was thy fall; dreadful the sin that called from the God of Love—thine Almighty Friend—a curse upon thy head; fearful thy shame and degradation before an offended Deity, and sad,—ah! sad the change, that came upon thee. I shudder to think of the wanderings of thy children since—their sorrows and sins—and turn from my painful reverie, to look again upon the bright landscape before me.

—Earth is not *all* sorrow; joy lives in many a heart; and love, and hope, and holy friendships, bloom even here; and many a heart goes forth to-day, as mine does, to greet this beautiful, holy Sabbath! And the distant church-bell catches the sound and echoes it far around over the distant hills! "Blessed, holy Sabbath bell! Let thy music vibrate o'er every hill-top, and the echo be prolonged through every glen, with its glad invitation, to weary, sin-sick mortals. Let it woo them to God's holy sanctuary, and the sweet paths of peace and holiness!"

—Now my heart is filled with sweet and happy thoughts, and I seem to be transported from my mossy seat upon the hill-top, to the gathering of the children of God! And I am sitting in the humble church, and listening to the deep, soul-thrilling accents of the pastor—God's loved servant! And my spirit thrills with deep, unearthly joy, as it drinks in the eloquence of Heaven, from those untainted lips! Now the sweet hymn of praise ascends, with its burthen of joy and thanksgiving, swelling out upon the air, then dying away like a pure stream of incense. And as I listen, my heart responds, "Yes, praise the Lord forever!"

Praise on earth, the God of love,
Praise him! Ye bright hosts above,
Every soul, the tribute bring,
Grateful praise to God, your King.

Barre, N. Y., May, 1853. VIANA MEADOWS.

# Educational.

## COLERIDGE AND HIS WRITINGS.

No mind which would gain a deep, clear, and expanded development of itself, can fail to derive much benefit from the study of the philosophical works of Coleridge, the master intellect of the early part of the present century, and the greatest genius of that epoch. It is a marked characteristic of his writings, that they not only shew his own profound wisdom and power, but create, mould, and direct mental power in others. No uninspired man ever gave utterance to more impressive, more suggestive, more thought-demanding, thought awakening ideas than he, or to ideas which will better repay, by their serene, systematizing, and healthful mental influences, our thoughtful study. A student and disciple *con amore*, of Coleridge, can never be a shallow and superficial thinker. His mental processes must partake of the depth, unity, and order, which pervade the best thoughts of this great teacher and philosopher.

Re-reading "The Friend," recently, we ran our pencil along some passages, which, taken by themselves, (though not as perfectly as in their original connection,) show the eminently suggestive nature of the writings of Coleridge. We copy from the introductory chapters of that work—with, in some instances, slight change of phraseology—the paragraphs below.

Speaking of the object of study, he says: The game started and run down may be rich and curious; but still at the end of the day it is the chase itself, the quickened eye, the lengthened breath, the firmer nerve, that must ever be the huntsman's best reward.

True instruction is not so much to show the reader this or that fact, as to kindle his own torch for him, and leave it to himself to choose the particular objects, which he might wish to examine by its light.

To amuse our visitors is wisdom as well as good nature, where it is presumption to attempt their amendment.

There is this distinction between thought and attention; we define thought to mean the voluntary production in our own minds, of those states of consciousness, to which, as to his fundamental facts, the writer has referred us; while attention has for its object the order and connection of thoughts and images, each of which is in itself already and familiarly known.

We insensibly imitate what we habitually admire.

The three great relations in which we are placed in this world, are—as citizens to the State, as men to our neighbors, and as creatures to our Creator—in other words, the political, moral, and religious relations.

Many a man, who has contrived to hide his ruling passion or predominant defect from himself, will betray the same to dispassionate observers, by his proneness on all occasions to suspect or accuse others of it.

—We shall continue this selection of apothegms hereafter, persuaded that we shall both please and benefit our readers thereby.—B.

## DEGENERATED WORDS.

How many words men have dragged downward with themselves, and made partakers more or less of their own fall!—Having originally an honorable significance, they have yet, with the deterioration and degeneration of those that used them, deteriorated and degenerated too. What a multitude of words, originally harmless, have assumed a harmful as their secondary meaning; how many worthy have acquired an unworthy! Thus *knave* meant once no more than a lad (nor does it now in German mean more;) *villain* than peasant; a *boor* was only a farmer; a *varlet* was but a serving man; a *churl* but a strong fellow. *Time-server* was used two hundred years ago as often for one in an honorable as in a dishonorable sense, "serving the time." *Conceits* had once nothing conceited in them; *officious* had reference to offices of kindness, and not of busy-meddling; *moody* was that which pertained to a man's mood, without any gloom or sullenness implied.

*Demure* (which is "*des mœurs*" "of good manners") conveyed no hint, as it does now, of an over-doing of the outward demonstrations of modesty. In *crafty* and *cunning* there was nothing of crooked wisdom implied, but only knowledge and skill: *craft*, indeed, still retains very often its more honorable use, a man's "craft" being his skill, and then the trade in which he is skilled.—And think you that the Magdalen could have ever given us *maudlin*, in its present contemptuous application, if the tears of penitential weeping had been held in due honor in the world?

*Tinsel*, from the French "*etincelle*," meant once anything that sparkles or glistens; thus "cloth of tinsel" would be cloth inwrought with silver and gold; but the sad experience that "all is not gold that glitters"—that much which shows fair and specious to the eye is yet worthless in reality—has caused the word imperceptibly to assume the meaning which it now has, and when we speak of "tinsel," either literally or figuratively, we always mean now that which has no reality of sterling worth underlying the glittering and specious show which it makes. *Tawdry*, which is a word of curious derivation, though I will not pause to go into it, has undergone exactly the same process; it once conveyed no intimation of *mean* finery, or *shabby* splendor, as now it does.

The word *prude* signifies in the present day a woman with an over-scrupulous affectation of a modesty which she does not really feel, and who betrays the absence of the reality by this over-preciseness and niceness about the shadow. This use of the word must needs have been the result of a great corruption of manners in those among whom it grew up. Goodness must have gone strangely out of fashion, before things could have come to this. For "prude," which is a French word, means virtuous or prudent; "*prud'homme*" being a man of courage and probity. But where morals are greatly and almost universally relaxed, virtue is often treated as hypocrisy; and thus, in a dissolute age, and one disbelieving the existence of any inward purity, the word "prude" came to designate one who affected a virtue, even as none were esteemed to do anything more; and in this use of it, which, having once acquired, it continues to retain, abides an evidence of the corrupt world's dislike to, and disbelief in, the realities of goodness, its willingness to treat them as mere hypocrisies and shows.

Again, why should the word *simple* be used slightingly, and "simpleton" more slightingly still? According to its derivation, the "simple" is one "without fold," *sine plica;* just what we may imagine Nathaniel to have been, and what our Lord attributed as the highest honor to him, the "Israelite without guile:" and indeed, what higher honor could there be than to have nothing double about us—to be without duplicities or folds? Even the world, that despises "simplicity," does not profess to approve of "duplicity" or double-facedness.

*Silly*, written "seely" in our earlier English, is beyond a doubt the German "*seeg*," which means "blessed." We see the word in its transition state in our early poets, with whom "silly" is so often an affectionate epithet applied to sheep, as expressive of their harmlessness and innocency. With a still slighter departure from its original meaning, an early English poet applies the word to the Lord of glory himself, while yet an infant of days, styling him, "this harmless *silly* babe." But here the same process went forward as with the words "simple" and "innocent." And the same moral phenomenon repeats itself continually. The French have their "*bonhommie*," with the same undertone of contempt; the Greeks also a well-known word. It is to the honor of the Latin, and is very characteristic of the best side of Roman life, that "*simplex*" and "*simplicitas*" never acquired this abusive signification.—*Study of Words.*

## THE UNALTERABLE PAST.

Who can estimate the power of the tongue? The utterance of a word or sentiment may be like seed-corn that will reproduce itself. It may fall on the ear of a friend, and find a lodgment in his heart. It may become to him a principle of action, and a rule of conduct, and may so enlist his sympathies and zeal for its dissemination that he may give it an extensive currency. The press is an extension of this power. It acts as an auxiliary to the tongue, giving substance to breath and endurance to sound. It does not die with the individual; it is not confined to his locality; it cannot be controlled by his will. When a man gives his thoughts to leaden type they may be scattered through every zone, and however earnestly he may strive to recall them, the effort is fruitless. "What I have written, I have written," said Pilate; it can neither be altered, nor obliterated, nor forgotten. How often have good men grieved over the follies and sins of their youth. What tears and pangs have been occasioned by the remembrance of the principles they advocated, the influence they exerted, the morals they corrupted, and the souls they injured, prior to their conversion to God. The doings of other days are made to live before us, a chastening for ourselves, a warning to our fellow-men.—*Episcopal Recorder.*

Written for the Rural New-Yorker.

## THE FORGET-ME-NOT.

While taking a solitary walk at the close of day, my eye fell upon a small plot covered with fresh blooming flowers, which were almost hidden by the weeds around them, and which certainly would not have been noticed, unless one was looking very closely. And now, I thought, I have indeed found a treasure. Although there is always a delight in finding what we have not before seen, and from which we may add to our fund of knowledge, it was particularly so now. Long did I gaze at the spot wrapt up in delightful thoughts. They looked like such pure things I hardly dare put forth my hand to pluck a flower, fearing my touch might wither them.

The shades of evening were hastening on and I could not think of leaving them there. So with care I gathered them up, roots and all, and transferred them to my flower garden, that I might admire them at my leisure, and learn more of them. On referring to my class book, I was delighted to find them christened the "Forget-me-not." What beauty, thought I, in the name as well as in the flower! Was it not a gift of the Creator that we might hold him in remembrance.

And is not this fact as really impressed upon every flower that blooms on his footstool? But man, for whom these beauties are provided, *will* forget, although there is much even in the humblest plant, and in the most obscure situation to remind him of his Maker.

Years have passed since, but the gentle lesson I trust has not been lost in its good effect, and I often think of the humble yet beautiful Forget-me-not. E. H. W.

Best thing of the Season.—Senator R., chairman of the committee on incorporations, in a hearing one day before his committee suddenly rose from his chair and reached over the table to examine a plan or map, in which movement he accidentally brushed from the table a full inkstand, which falling into the chair, left its contents on the leather cushion and rolled on to the floor. The Senator, all unconscious of the mischief, being about to resume his seat, was cautioned by a bystander, when turning and looking upon the inky pool, he coolly remarked, that though chairman of the committee on *ink-operations* he would decline sitting in that particular case.—*Dover Inq.*

Ignorance takes to dirt as naturally as it does to ugliness. In proof of this, we would mention that a dealer in ashes informed us that the opening of a public school in a Ward increases the sale of "yaller soap" twenty-five per cent. From this it will be seen that the more people read, the more they think; and the more they think, the more frequently they indulge in wash basins and clean towels.

Most men die before they have learned to live.

Remorse very often barbs the arrow of affliction.

When we look at a field of wheat we find that those stalks which rise their heads the highest are the emptiest. The same is the case with men—those who assume the greatest consequence have generally the least share of judgment and ability.

Will, Wit and Judgment.—At twenty years of age the will reigns; at thirty, the wit; and at forty the judgment.

# Miscellaneous.

For Moore's Rural New-Yorker.

## STANZAS.

When winter's gems of frozen dew
Reflect the golden ray,
The sun that gilds, destroys them too—
In tears they melt away.

When spring's gay violets bloom at noon,
And odorous gales supply;
Nipt by the evening's frost, how soon
Their bloom and odors fly.

The summer's rose, in dewy morn,
Full blown, the garden's plume,
Noon scatters from the naked thorn,
And tastes its last perfume.

Such are the charms that mortals wear,
Such beauty's vain parade;
Thus of the young, the old, the fair,
The transient graces fade.

North Ridgeway, N. Y., 1853.

For the Rural New-Yorker.

## LIFE IN THE COUNTRY.

Don't like life in the country, eh? Well, *we do*. We love its spring-like freshness, and its genial sunshine; the gorgeous sunsets, and untold charms of morning. What is the use in being pent-up in cities, with the privilege of seeing every one, and no one to see you? It may do for some; but it never came up to our standard of enjoyment. Rather give us the feeling of rural independence, and domestic happiness, and we will cast all your boasted city refinement into the shades of forgetfulness. We will throw contentment and happiness into the scale opposite your so-called "luxuries," and shall take a pride and pleasure in seeing the latter "strike the beam." And then it is such a great thing to be a farmer—an intelligent, free-and-easy, and contented farmer, that we cannot help liking a farmer's life, and regarding it as an honorable avenue of labor. It is the basis of true independence—the foundation of genuine nobility. Others may sing of:

"—— Life on the ocean wave,
And a home on the rolling deep."

But for us, we prefer a life in the country, and a home on a well-cultivated farm.

W. E. K.

## THUNDR STORMS vs. TELEGRAPHS.

It's all very fine to talk of Prof. Morse having harnessed the lightnings, previously tamed by Franklin, but a short stay in a telegraph office during a thunder storm, will convince any reasonable man that leviathan is not so tamed. On such occasions, the fierce element, awakened by the roll of old Jove's thunder to think of the time when it shot unfettered through the expanse of ether, chafes indignantly at the presumption of man, and on the first convenient opportunity, kicks over the traces in a manner not at all to be trifled with. It conveys a plain intimation that any little favors it may render in pleasant weather are owing more to its good nature than any prowess of a human conqueror, as an elephant sometimes condescends to obey the command of a child and totes it about for amusement.

But when there is any sporting going on above, any muss in which sharp cracks and hard cracks are the order of the day, the purple winged servant takes the responsibility of neglecting the drudgery allotted him by his earthly master and is off on the clouds, rattling the brilliant chains in mockery of Franklin, Morse, Bain, Faxton and the united force of the Washington Patent Office, who have gravely docketed him as a bond-slave. Nor has he much respect for the fugitive slave law, for he resents an attempt to force him back into the harness with a snap, surpassing all the "Jorry rescuers" in the world.

There was a fine illustration of this on the line of the New York, Albany and Buffalo Telegraph Co. yesterday. The roll of heavenly artillery in the morning announced a gala day, and immediately after breakfast the "tamed lightning of Franklin" began to kick over the traces. It is but justice to the animal, to say that fair warning was given to the drivers that he was "in for a good time." But business pressed, and Superintendant Wood refused the application for a holiday and ordered the work to go on.—Then the leviathan rose in his might. At the first click of the key, he rolled hot shot into all the offices from Albany to Buffalo. His compliments reached the Utica office with a crack as loud as a pistol, which left one relay *hors du combat*, and set the operators "a thinking."

Wood rallied his men and once more set them at the batteries, but the enemy had passed on and was committing havoc elsewhere. The stillness of death was all the answer to be got from the West, till somewhat later it was announced by piano at the House office that the Morse office at Buffalo was a victim of the strike. The same blow that finished the relay here, pitched into Buffalo with a warmth that melted every relay, and as the report said, fired the papers and tables in the office. The field was won and the forked messenger had his holiday, though the operators went through the motions occasionally during the day, to keep up appearances and make greenhorns think they had still got the old fellow bottled.—*Utica Gazette.*

The brave man always thinks of self the last.

The strong man best commands his strength alone.

## COUNTRY PAPERS.

We like country newspapers. With a few exceptions they are capital vehicles to thought. Freshness, originality and fact characterise many of their editorials. They are purged from the guile of great and crowded cities. They are sent forth from the midst of nature's most beautiful things, birds, trees and flowers—woods, valleys, and the broad, free, blue heaven. Those who occupy the seat editorial, though they may be learned in the classics, are not worldly in the common sense of the word. They go not wearily to the sanctum day after day, with brains steeped in wine, and aching with the reminiscences of gas light and crowded *fetes*. They are not obliged to fill their columns with long descriptions of whirling dancers and hackneyed stars. They have few sickening details of rows and murders.—Untainted by city vices, they take high and pure views of life. Altogether, one feels to breathe freer and think better of his fellows after reading a right smart country paper.

In their corners are many little effusions of choice poetry. Often they are superior in freshnesss and feeling to much that is lauded by the city press. They bring with them rural pictures of old farm houses half hidden by the foliage of summer.

There in some cherished corner, the blooming country lass, like a beautiful wild flower in seclusion, pens her pretty thoughts, and sends them under some anonymous signature to the village editor. He puzzles his brain to think who it can be. Conjures before his vision all the Lauras and Marys who cast sly glances at him at meeting, or whisper to each other as he passes, "that's the editor."

He little dreams it is the rosy maiden of whose substantial bread and butter he so often partakes. He has sometimes caught sight of her though the steam of the—— shades of distinguished authors!—the wash-tub—but never thought she gave time to the muses. It is nevertheless. He is favored some day by the proud old farmer—father, or devoted, mother, with a glance into that favorite study. Of *course* Mattie knows nothing about it. What a charming wife she would make! Good poetry and good cooking!

Hereafter commend to us the country paper. Sparks from the thought-anvil fly thick and fast; joyous and bright they are—the editor is married! The country paper is more of a gem than ever; and the reason is because "woman, or man is double you."

Success to country newspapers!—*Boston Olive Branch.*

## BURNS' POWERS OF CONVERSATION.

What a pity that Burns had no Boswell to track his steps, and catch the fire-syllables which fell in such rapid profusion and bickering brilliancy from his touched lips! His talk seems to have been as strong, natural, and rich in essence as ever flowed from the lips of man. It was strong as a native power, and it was, of all his powers, the most carefully cultivated. Like Dr. Johnson, he generally set himself to "talk his best." In society, and particularly in that of ladies, he seemed to "forget his poverty, and remember his misery no more." His soul expanded, his heart opened, his eyes kindled, his rough voice softened into music, and the pent-up waters of wisdom, wit, tenderness, humor, and knowledge of human nature, which were in him, "flowed amain." Hearts burned within them—eyes moistened—bosoms heaved, as he talked; laughter looked out through eyes that wept, or tears came and drowned laughter; many were agitated and shaken, and others, obeying the calmer and mightier spell of his genius, felt as John Scott so finely says: "Their minds touched with a strange joy, which they may recognize in more exalted stages of their being."

All this effect was produced, not by an elaborate artist playing *bravurae*, not through any assumption of oracular depth or dignity, not through any determination to be the chief speaker, but through the more outpouring of a mighty soul, which had besides made conversation a study, found in it a fit element, and learned to spring up under the genial influence of society into its fullest power, like the war-horse to the sound of the trumpet. How one wishes that Burke, the greatest talker then alive in England, had met and measured lances with Burns, the greatest talker in Scotland; and that Bozzy, who was still alive, had been subpœned to be present.—They had been wonderfully well met, for in native genius and wealth of mind they were equal; and Burke's subtle reflection and profound learning would have found a counterpoise in the brilliant wit and robust manhood of the intellect of Burns.

An Old Bachelor's Epitaph.—A lady had been teaching the summer school in a certain town, and a young sprig of the law paid her some attention, so much so that he was joked about her. He replied that he "should look higher for a wife." It came to the lady's ears, and she meditated a little bit of revenge. An opportunity soon offered. They were at a party together, and to redeem her forfeit she was to make his epitaph. She gave the following:

"Here lies a man who looked so high,
He passed all common damsels by,
And they who looked as high as he
Declared his bride they would not be;
So 'twixt them both he died a bach,
And now has gone to the old scratch."

—*Exeter News Letter.*

To keep yourself in a state of discontent set your heart on having everything exactly to your mind.

The thought of war, even in a righteous cause is terrible: Heaven never will help till all human aid fails.

## THE TWO MOTTOES.

*(Concluded from page 164, this number.)*

"Ah! you are the doctor's relatives?" said Mr. Rosman, gazing at the young man with a certain degree of interest. "Chance could hardly have directed you better, sir, for I was his oldest and most intimate friend."

This sort of mutual recognition led the conversation to the deceased doctor. Mulzen had never seen him, but he felt for him that sort of respectful regard which instinct establishes between members of the same family. He talked a long time of the doctor; listened with great interest to details of his life and of his last moments; and at last, after one of those intimate conversations in which heart and mind throw off disguise, and display themselves as they really are, he retired to bed, delighted with his hosts, who, on their part, were equally pleased with him.

Tired with his journey, it was late when he awoke next morning. He hastened to dress himself, in order to seek his cousin, whom he was to accompany to the notary with whom the will was deposited. But on going down into the breakfast room he found the notary there, with Mr. Rosman and Fortin, for whom a message had been sent.—Miss Charlotte and Louisa soon appeared. When all were assembled, Mr. Rosman turned to the two young men, and said, with a smile:

"All here present are interested in the matter which brings you to Kayserberg, gentlemen; for my sister-in-law, Miss Charlotte Revol, and my niece Miss Louisa Armand, whose guardian I am, have come hither, like yourselves, to witness the opening of the will of their brother and uncle, Dr. Harver."

The two young men bowed to Miss Charlotte and Miss Louisa, who returned their salutation.

"Since accident has brought together all the parties concerned," continued Mr. Rosman, "I thought the doctor's last wishes might be made public here as well as at the notary's office."

Fortin made a sign of assent. Everybody sat down and the notary was about to break the seal of the will, when he checked himself.

"This will," he said, "is of old date, and, during the latter months of his life, Dr. Harver told me several times that it was his intention to destroy it, so that each of his heirs might receive the share regulated by law. The non-execution of his intention I can explain only by the suddenness of his death. I deem it my duty to declare this; and now I ask all the interested persons here present whether they are disposed to fulfil the doctor's expressed intention, and to cancel the will with one consent, before any know whom the document enriches.

This unexpected proposal was followed by a pause of some moments duration.—Mulzen was the first to break silence.

"As far as I am concerned," said he, modestly, "having no particular claim upon the good will of the deceased, I cannot consider that I make a sacrifice in agreeing to an equal division of the property, and I am quite willing to consent to it."

"For my part," said Miss Charlotte, "I make no objections whatever."

"In the name of my ward," said Mr. Rosman, "I give my consent."

"Then," said the notary, turning to Henry, "there is only this gentleman."

Fortin seemed somewhat embarrassed.

"Like my cousin," he at last said, "I have no ground to expect that the will favors me, but that is the very reason why I should be guarded in my decision. Whatever may have been the doctor's intentions, his will alone can now be considered to express them; to neutralize before-hand his testamentary dispositions, is to infringe both on the rights of the will, and on those of the unknown legatee."

"Let us say no more about it," interrupted the notary. "Prompt and perfect unanimity could alone make legitimate my proposition. Let us remain in the strict limits of legal rights—as you, sir, propose; and now please to listen."

With these words he tore open the envelope, opened the will, and read as follows:

"Of the four persons who can lay claim to my inheritance, I know but two—my sister, Charlottle Revel; and my niece, Louisa Armand. But these two, long united by the strictest affection, have but one common interest, and may be considered in fact, to constitute but one person; with respect to them, therefore, I have only Louisa to consider. My first intention was to bequeath to her all I possess; but it afterwards occurred to me that one of my two nephews might be equally worthy of my regard. The sole difficulty is to find out which of the two it is.

"Unable to investigate this point myself, and well knowing the intelligence and right mindedness of my niece, Louisa, I refer the matter to her judgment; and I constitute my sole heir that one of the two cousins whom she shall select for her husband.

"Harvers."

When the notary paused, after completing the perusal of the will of the eccentric but well-meaning doctor, a silence of some duration ensued. The two young men looked embarrassed, and Louisa held down her head.

"*Mon Dieu!*" cried Miss Charlotte at last, "the doctor has bequeathed a very difficult task to my niece."

"Less difficult than you think, sister," said Rosman, smiling. "I have long been acquainted with the contents of Harver's will, and I have made inquiries in consequence. The result of those inquiries convinced me that, whatever her choice, there was nothing to fear for Louisa."

"Then let Miss Armand decide," said the notary laughing. "Since there is safety in either case, she has but to consult her aspirations."

"I will beg my aunt to decide for me," murmured the young girl, throwing herself into Miss Charlotte's arms.

"I decide," cried the old lady;—"it is very perplexing, my dear, and really I do not know."

But whilst uttering these words with an air of indecision, Miss Charlotte's first glance was at Mulzen. Fortin perceived this.

"Ah, Madame," cried he quickly, "I see that your choice is made, and whatever my regrets, I cannot but approve it. Mademoiselle," he continued, taking Mulzen's hand and leading him to Louisa, "your aunt has seen and judged rightly; my cousin is more deserving than I am."

"Your present conduct proves the contrary," said Miss Charlotte, touched by this generosity; "but we already know Mr. Mulzen a little; and then—in short, you deserve to hear the whole truth——"

"Tell it me, by all means," interrupted Fortin.

"Well, then, his motto encourages, whilst yours deters me; he promises indulgence, and you justice. Alas! my dear sir, justice may suffice for angels, but men have need of charity."

"You are perhaps right, madam," said Henry Fortin, thoughtfully; "yesterday and to-day everything seems to combine to give me a lesson. The rigid defence of my right has always turned against me, while my cousin's benevolence has in every instance profited him. Mulzen was in the right; his motto is better than mine, for it is nearer to the law of God. Christ did not say, *To every one his rights*; but rather, *Love your neighbor as yourself.*"

## ALL HAIL, THE MONTH OF MAY!

The month of May—the building month, the blooming month, the beautiful month, the bright, balmy, blessed month, the breathing, brilliant, beatific month,—bibulous of dews, Briaroan with branches, broidered with arbutus, and broken with the Babel and babble of birds—is here! Mark her advent, as, in her car of flowers, she drives her zephyr-steeds along the valleys and over the hills, and guides their airy course with her hyacinthine wand! As she passes by she throws out to us her floral treasures, wet with the dews of youthful association, brilliant with the hues of golden memories, fragrant with lovegiving perfumes, and fresh with the light of hope. All hail! Oh month of May! Simple "May Day" to children, and simple nothing to multitudes of men, as this thy first day may be, to us it is fraught with happy remembrances as well as present joy.

We wonder if miss Tarbox (if she *is* Miss Tarbox, and is not the mistress of a large family of children,) has forgotten a May Day of almost a score of years ago, when a happy school girl of sixteen she went, arm in arm, with a happy school boy, in the early light, to the top of a mountain, in company with a great many other school boys and school girls. She was a little, graceful thing, with a mild, blue eye, and a pretty foot, (we could not help seeing it as we climbed the rocks and fences,) and the sweet little touch of her hand upon an unaccustomed arm had more than the power of electricity in it. We "cottoned to her."—We could not help it. How that shawl bothered, and how much pains we took to adjust and re-adjust it upon her charming shoulders! How she blushed and complained of the warmth of the weather, when we told her, with the license of the occasion, how pretty she was, and how nice it would be to have a house on the mountain, and live away from the world! And then, when we had arrived at the summit, and she was seated on a rock, what half understood caresses were mutually conveyed, in the touches that attended the trimming of her saucy hat with shad blossoms and evergreens, and the adornment of our hat-band and button-holes with the same products of the spot! How she clung to us, in the steep places as we returned! And how the whole company marched back through the village, as the sun was rising, freely and gaily:

"Hail! All Hail! thou merry month of May!"

Dear Miss Tarbox—do you remember all this? If you do, and you are married, tell your husband what a handsome beau you had, away back in eighteen hundred thirty and something, and heave a sigh with us "for auld lang syne."

This is a day of laying up such memories. They are purchased cheaply, and are more precious than gold. But there is a tenderer, sweeter, and more sober interest, attached to the month. The fairest and purest of all God's creatures die in May. That sweet, consumptive sister died in May. That darling wife and frail child died in May. It is early floral month of the angels, as well as of men, and, as we upon the earth go out into the fields to pluck the pure flowers of Spring, they come down to search for fairer flowers, and when they find a soul budding in modest beauty upon the bosom of a chilled and suffering nature, they pluck it, and, weaving it with green hopes and blessed tendrils of affection, bear it home, while the tears upon the holy burden glisten and grow golden like dew in the rising light of Heaven.

So, whether we find heaven in May, or May in Heaven; whether it be the month of flower seeking with children, or with angels; whether it come to us in love or hope, in youth or age, in innocent merriment or chastened grief, it is a month to be welcomed with open hands and an open heart.—Go out upon the hill-side, go into the meadow, climb the mountains, thread the rivulet, run among the rocks—romp, meditate, dream—and do all in choice companionship, and the day shall linger in the memory through after years as a gold-browed mountain lingers in the sunset.—*Springfield Republican.*

When men try to get more than comes from well-doing, they always get less.

# For the Ladies.

For the Rural New-Yorker.

## TO LILLIE.

Those gentle tones, oh! those gentle tones,
They're in my heart to-night,
As when last they rung in my 'raptured ear
In the calm of the evening light.
And I feel again that parting kiss,
Upon my throbbing brow,
And oh! that little hand seems pressed
Within mine own e'en now.

And those burning tears, oh! those burning tears,
Still lay upon my cheek,
As her trembling lips essayed in vain,
The "farewell word" to speak.
I have gazed on many a form since then,
Fair brows, and eyes of light,
But *her* image dear, oh! her image dear
Is in my heart to-night.

Ithaca, N. Y., 1853. * * * *

## DIGNITY OF WOMEN.

[Translated from the German for the Rural New-Yorker.]

Honor the women who twist and weave celestial roses into terrestrial life,—twist the prosperous bond of love, and in the chaste robe of grace diligently nourish, with holy hand, the everlasting fire of virtuous feelings.

The dissolute power of man ever wanders out of the boundaries of truth,—restless, his passionate thoughts float along the ocean; eagerly he extends his hands into the distance; his heart is never calmed,—through remote stars he pursues restlessly, the image of his dreams. But with a magically fettering look, the women beckon back the fugitive; warning, they beckon him back, to the precincts of the present. In the moderate house of their mother they have remained with modest manners, the faithful daughters of gentle nature.

The efforts of man are adverse, and the dissolute man leads a life without rest and abode; but with crushing force, what he contrives he destroys again; never does the contest of desires lie in tranquility: like the head of the hydra, it ever falls and is renewed. But with a more peaceable glory, the women pluck the flower of a moment's duration, and nourish it carefully with charming diligence, securer in their fettered works, richer than he, in the circuits of science and in the boundless orbit of invention.

The cold breast of man, strongly and powerfully satisfying itself, and heartily clinging to a heart, does not partake of the divine joy of love, nor of the exchange of souls; he does not melt into tears; even the struggles of life make his unfeeling mind more and more obstinate. But, as the Æolian harp, gently shaken by the zephyr, quickly trembles, so the feeling souls of women, tenderly alarmed by the image of woes, tremble,—their lovely hearts are agitated and their eyes, sparkling with heavenly dew, emit rays of light.

Man rules with the insolent right of power; the Scythian proves his right with the sword, and the Persian becomes a slave.—The unruly passions attack each other furiously, and one race gives place to another. But with softly persuading entreaties, women wear the sceptre of manners, extinguish discord, which rages clamorously; they teach the powers which hate each other to embrace each other in the loveliest manner, and unite what is naturally opposed.

S. T.

Woman's Beauty.—It is not the smiles of a pretty face—nor the tint of her complexion—nor the beauty and symmetry of her person—nor the costly dress or decorations, that compose woman's loveliness.—Nor is it the enchanting glance of her eye with which she darts such lustre on the man she deigns worthy of friendship, that constitutes her beauty.

It is her pleasing deportment—her chaste conversation—the sensibility and purity of her thoughts—her affable and open disposition—her sympathy with those in adversity—her comforting and relieving the afflicted in distress, and, above all, the humbleness of her soul, that constitutes true loveliness. Beauty unadorned with but those of nature and simplicity, will shine like the refulgent sun and display to man that the beauty of your person is not to be found in tinsel ornaments of your body; but in the reflection of the rectitude and serenity of a well spent life that soars above the transient vanities of this world.—*Albany Transcript.*

True Object of Taste in Dress.—The true object and importance of taste in dress few understand. Let no woman suppose that any man can be really indifferent to her appearance. The instinct may be deadened in his mind by a slatternly, negligent mother, or by plain maiden sisters; but she may be sure it is there, and, with little adroitness, capable of revival. Of course, the immediate effect of a well-chosen feminine toilet operates differently in different minds. In some, it causes a sense of actual pleasure; in others, a consciousness of passive enjoyment. In some, it is intensely felt while it is present; in others only missed when it is gone.

The lady who treats the husbandman with scorn, because he is a farmer, contributes something towards increasing the number of candidates for the State prison and the gallows.

MOORE'S RURAL NEW-YORKER.

ROCHESTER, MAY 14, 1853.

### PUBLISHER'S NOTICES.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW-YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ OUR *lowest* club price is $1,25 for any number of copies over 20—and $1,50 under that number, unless a full club of twenty is ordered.

☞ ADVERTISEMENTS must be brief, appropriate to the objects of the paper, and accompanied with the cash.

ADDITIONS TO CLUBS—Are still in order. Having but few back numbers, agents and others can order additions to Clubs at $1 per copy from 1st of March or April to end of the year and volume. New Clubs, or single subscribers, can begin 1st March, April, or May, as preferred.

### Our Premiums.—The Result.

ON posting our books, we find that the following named gentlemen are entitled to the Premiums offered for obtaining the largest lists of subscribers to the RURAL NEW-YORKER previous to the 1st of this month:

1. L. D. BRANCH, Trumansburg, 350 subscribers,—$50 in Cash.

2. E. R. HUGHES, Lyons, 254 subscribers,—$30 in Books or Implements.

3. J. H. STANLEY, Le Roy, 209 subscribers,—$20, payable as above.

4. S. E. NORTON, Phelps, 141 subscribers,—$15, as above.

5. I. W. BRIGGS, West Macedon, 100 subscribers,—$12 in Books.

6. J. VAN HORN, Ovid, 93 subscribers,—$8, as above.

7. G. N. SHERWOOD, Camillus, and E. W. FAIRCHILD, East Bloomfield, have each obtained 81 subscribers.—and altho' but one premium of $5 was offered, we award to *each* $8 in Books.

The Premiums for the largest lists forwarded previous to the 1st of January, are awarded as follows:

1. E. R. HUGHES, Lyons, 201 subscribers,—$15 in Cash.

2. L. D. BRANCH, Trumansburgh, 175 subscribers,—$10 in Books.

3. J. H. STANLEY, Le Roy, 162 subscribers,—$5 in Books.

Such of the above premiums as have not already been paid, will be on receipt of orders from those entitled—specifying their wishes in the premises.

The Town Premiums have not been specially competed for, but if claimed we shall award according to population as given in last Census.

Our *Specified Premiums*, (offered to persons not competing for those mentioned above,) have excited the greatest attention. Some *five hundred persons* have become entitled to premiums in books, and extra copies of the RURAL, or volumes of the Wool Grower or Gen. Farmer; and about *one hundred* of the number have obtained from 20 to 80 or 100 subscribers each. Premiums have been forwarded to most of the persons entitled: such as have not yet been paid, will please forward their orders. We publish a list of Books on next page, but do dot confine competitors to so brief a catalogue.

—The large number of persons who have, during the past five months, generously exerted themselves to extend the circulation of the RURAL, are entitled to more than mere premiums, or our grateful acknowledgements—for we are confident they were generally actuated by a desire to enhance the welfare and prosperity of community. They have introduced the paper in many sections where it was before unknown—*added* between six and seven thousand to its circulation—and in so doing furnished us the means of partially remunerating them, and of making for all interested a better journal than heretofore. We bend low under the unexpectedly large weight of obligation exhibited by an examination of our subscription books,—and assure each and all of its friends, that we shall endeavor to render the RURAL NEW-YORKER worthy of the large and substantial encouragement it is receiving.

### Advertising.—Our Terms and Position.

AS SOME are disposed to demur at our recent increase of price for advertising, we will briefly state why the new terms were adopted. This explanation, we may premise, is not considered due any one,—for we have never solicited patronage, as such, from advertisers or others.

The principal reason for the increase was, or is, the fact that the circulation of the RURAL has *more than doubled* since our former rate was established—equally augmentiug the benefit of advertising. In other words, the use of our columns as an advertising medium is worth more than double what it was a year ago—and, as we believe, all and more than we demand. One object in view was to check the *continuance* of advertisements, in order to accommodate the largest possible number of applicants in a limited space, without infringing upon the reading matter of the paper—and hence we made no increase of price for the *first* insertion, but only for subsequent publications.

Of the benefits of advertising in this or any other journal, we propose to say little—for the reason that we have no occasion to offer arguments on the subject. As our readers are aware, we have *never* published a line in our reading pages about the great benefit of advertising, and then mentioned, or hinted at, the superior advantages of the RURAL for that purpose,—because, from the start, we have had more occasion to decline than solict advertisements. Hence, what we now say is for the more particular information of certain wise-acres, who seem to think they "know the ropes"—to save all such any time they might otherwise waste in attempting to induce us to deviate from established terms.

Some days ago, a person called and asked our price for advertising a certain valuable agricultural machine. We gave it, to a farthing—according to our published rate. "That is too much," said he, with eyes distended. "Why, I can get it inserted for $—, in the *Genesee Farmer*, and that has a circulation of *forty thousand!*" We quietly replied that we did not ask his patronage, and had no objection to his advertising elsewhere—that the price of advertising in the G. F. was *just double* what we charged, but if its circulation was one thousand greater than that of the RURAL, we would insert his advertisement to the amount of $100 (according to our usual rate) for nothing! This somewhat mollified our applicant, and after a little inquiry of those who were better posted, he concluded that we were perfectly safe in making such a proposition. (We mention this with no wish to injure the G. F., and it will not—for we believe the publisher of that journal has as little occasion as ourselves to solicit advertisements, although he receives much the greater price in proportion to circulation.)

Our terms are frequently demurred to because they are greater than those of "other papers." To all such we have but one reply—that we believe (and we are pretty well posted on this point,) the circulation of the RURAL NEW-YORKER is greater than that of any other rural journal in the Union—(the *Boston Cultivator* alone excepted, and that does not publish advertisements)—while our price for advertising is far less, *in proportion to circulation* (the best criterion of value,) than the generality of such papers. Indeed, the *increase* of our subscription list since January last, is alone larger than the whole circulation of some journals whose advertising terms are the same as ours. As to comparing our prices with those of country papers, as some insist upon doing, there is no reason or justice in the premises. If we were to charge as high (in proportion to circulation,) as do such papers, our price would be from two to four times greater than at present.

—Lest some consider us a trifle too independent, we beg leave to remark, in extenuation and conclusion, that we have been *bored* on this subject, and want no more calls or letters from persons who wish us to be governed by *their* terms, or those of other publishers. We solicit no man's patronage in this line, and wish to devote most of our space to reading matter—for we *have* quite a good many subscribers, (thanks to the generous and influential friends of the RURAL all over the Union, and the rest of America,) and desire to give each one the worth of his or her money. That the RURAL possesses many and superior advantages as an advertising medium we, and others, are fully aware,—yet we have not felt called upon, heretofore, to allude to the fact particularly. But those who use its columns for their individual benefit, must pay something toward a fair equivalent for the privilege. To this we are entitled. We expended several thousand dollars before the "medium" was established; and had we not ventured our all in the enterprise, the RURAL NEW-YORKER would not now have, as we firmly believe it has, *a larger subscription in Western and Central New York, than any other newspaper whatever*—aside from its extensive circulation in other States, Territories, and the Canadas.

### The Latest Massacre.

THE particulars of the Railroad collision in Michigan, and of the Burning of the "Ocean Wave"—the wholesale murders of a week—had scarcely reached the readers of the daily press, ere they were startled by intelligence of another Railroad Accident, by which more than FIFTY most valuable lives were sacrificed. And the conviction is forced upon all, that the careless recklessness of the Conductor and Engineer must be charged with this frightful and murderous catastrophe. How long shall this be so? How long shall heedless, passionate, and reckless men, be allowed to hurry into instant death, car-loads and boat-loads of men, women and children, with scarce a shadow of an excuse for the horrible slaughter?

The Latest Massacre took place at Norwalk, Connecticut, about half way between New Haven and New York. A small river empties into the Sound at that place, across the broad mouth of which the New York and New Haven Railroad passes by a draw bridge. At eight o'clock on Friday morning, a train full of passengers left N. York, and reached Norwalk between nine and ten. The draw of the bridge was up, a steamer having gone through. The usual signal was displayed, but the train passed on, slowly it is said, as if to make the matter deliberate, toward the fatal leap. The brakeman was even able to disengage the rear cars. But the Engine ran off the bridge in fifteen feet of water, dragging with it the baggage and two passenger cares full of passengers, and up to the latest accounts FIFTY-TWO BODIES have been recovered. Two of the injured have died; twenty-eight others are seriously injured, and three dangerously. Six others, who were believed to have been on board the train, are yet missing.

Those who peruse the full reports of the daily papers, will observe the names of many physicians among the dead and injured. The U. States Medical Convention had just closed its session in New York, and the representatives of the Faculty in New England were returning to their homes, when several of them met this sudden and awful disaster at the very outset of their journey.

Careful and proper precaution on the part of those who have the management of Railroads, would render such frightful scenes unnecessary and impossible. Let public opinion demand that it be given, at once, and at any cost.

## Correspondence.

### Notes from the Capital.

MESSRS. EDITORS:—A few weeks have made a great change in our city. A month ago, the Legislature were busily engaged in manufacturing news, and the dullness in other business enabled people to read it and comment thereon. Now the Capital is deserted, and the rush of general business requires every man to be at his post. Add to this, the item of moving, and you have an idea of the hub-bub we are in. As May-day happened on Sunday, the circulating population "split the difference;" some preferring Saturday, and others Monday.

The city journals are working hard to manufacture "public sentiment," preparatory to the "Extra Session" of the Legislature, which convenes on the 24th inst.

About 20 square miles of the "Pine woods" between this city and Schenectady were burnt over recently; one house and barn were consumed, and considerable damage done in various ways.—The fire was caused by setting fire to some brushwood by some boys. The farmers turned out with plows, &c., and succeeded in keeping it within the above limits. *OWE.*

Albany, May, 1853.

### Incidents of Travel Westward.---No. 1.

*Village of Albion—Buffalo, its rapid growth—Steamboat Empire State, its cost, number of crew, salaries of Officers, &c.—Lake Erie, mean depth, &c.*

MR. EDITOR:—After leaving your beautiful city, we took the cars of the Niagara Falls and Lockport Railroad for Buffalo. This new and beautiful road, passes through Albion, Lockport, Tonawanda, &c., and is skirted by some of the finest and richest wheat lands in the State. We spent a part of a day and night in the enterprising village of Albion, the county seat of Orleans Co.—It has about 3,000 inhabitants, several churches, and a Female Seminary very well sustained. It has two newspapers, two Banks, several flouring mills, and does a large and flourishing mercantile business.

Buffalo is a city and port of entry, and the capital of Erie county. This town, since its destruction by fire during the war of 1812, has had a very rapid growth. In 1810, the population was only 1,508; in 1840 it amounted to 18,213; in 1850 to some 45,000. This increase may be attributed mainly, to its position, situated at the termination of the Erie Canal and of the Albany and Buffalo Railroad. It is the gateway to the great West, and has necessarily become the great entreport for the merchandise of the East, and the agricultural products of the new and fertile West. It has a good harbor and over three hundred steamers, schooners, and other sailing craft, move out and in to this retreat.

After spending about one day in the city, we embarked on board of the Empire State for "Forest City." This is one of the largest class steamers, and belongs to the Southern Michigan Railroad Co. It runs to Toledo in 15 hours from Buffalo. Its length is 325 feet, breadth 40 feet, and cost $140,000. Its engine, boilers, shafts, &c, cost $70,000, and we were told weighed some over 400 tons. It consumes each trip (i. e. out and back) 120 tons of coal, worth from $2,50 to $3 per ton; also 25 gallons oil, worth $1 50 per gallon. Its crew consists of 50 men and two women. The captain has a salary of $2,000 per season. The first mate receives $80 per month; second mate $50 per month. The first engineer has $100 per month; second engineer $50 per month. The wages of the other men vary from $16 to $25 per month. The saloon, which to use the language of Dr. BEECHER, is "one of the breathing holes of hell," is rented for $1,000 the season. This is the resort of gamblers and blacklegs, who infest all the upper lakes, and support a miserable existence by skinning and fleecing each other, when they cannot find a green-horn to ensnare or victimise by their wiles.

Lake Erie was beautifully tranquil and the noble boat walked the water "like a thing of life." Lake Erie is over 300 miles in length, but is not deep. Its average depth is only 84 feet, while Lakes Huron, Michigan and Superior average 1,000 feet. Its comparative shallowness give the winds undue power over this body of water, and at times throw it into terrible commotion. It is the most dangerous of the western lakes, mainly from this cause. It is more properly a river than lake, as the waters of the larger and upper lakes flow through it on their way to leap the great cataract of Niagara, where the water power is calculated to be of 4,533,144 horse power—nineteen times greater than all the motive power of Great Britain, and more than sufficient to work all the factories of the world.

S. B. ROCKWELL.

Steamer "Empire State," April, 1853.

### A Trip to Herkimer County.

EDS. RURAL:—A ride through the rich valley of the Mohawk, even at this early season, is a real treat. Farmers seem to be "up and dressed" for a spring campaign, and every thing that can work, is required to be *on duty*. Truly, this is the active season for the farmer. It is also full of hope, for while

"With measured step he sows the grain,"

he looks forward with confidence to the golden harvest and the "January instalment," as a reward for his arduous toil.

Herkimer Co., is emphatically a dairy County. Within a few years, nearly every farm that would support as many as a dozen cows, has been converted to that purpose, and as a consequence, the land has been improved, and the pockets of the farmers have been well lined. Much of the land is now held as high as $75 per acre.

The prospects for the present season are better than was anticipated. The late fall, the mild winter, and the early spring, have combined to lengthen out the supply of fodder, and though hay has sold briskly at $15 per ton, it is believed that stock generally are in fair condition, and that the amount of cheese will not be materially diminished.

The improvements in building, and the refinements and luxuries of life, keep pace with the general increase of wealth and intelligence.

T. H. B.

## Literary Notices.

SPIRITUAL VAMPYRISM: The History of Etherial Softdown, and her Friends of the "New Light." By C. W. WEBBER. Philadelphia: Lippincott, Grambo & Co. 1853.

WE have never taken much interest, either in the theories or facts of the "Spiritual Philosophy"—having other business claiming our time and attention, and not possessing any large share of curiosity on the subject. But others have, if the number of books it has called out may be taken as an indication; and here we have another of these volumes by a well-known and talented writer. It is a neatly bound work of some 250 pages, and may be found at DARROW'S Bookstore.

"SPIRIT-RAPPINGS" Examined, Illustrated and Exposed. By Rev. H. WHITCHER, Rochester.

THIS is a lecture published in pamphlet form by DARROW. Its title explains its character, and it seems written with considerable ability.

THE POPULAR EDUCATOR for May, is the first number of a new illustrated monthly, in which it is proposed to include a regular course of instruction in the departments of Language, Natural History, Mathematics, Physical and Industrial Science, Fine Arts, Anthropology, History, Philosophy, Political Science, and Civilization, illustrated by all necessary diagrams and engravings It strikes us that this is altogether too large an undertaking for a monthly periodical of 44 pages, and that studies pursued so desultorily as they must be from this work, can be of no great benefit to the learner. It makes available to the masses much valuable information at a low price, however, and is worthy of patronage. New York: Alex. Montgomery. $1,50 per annum.

THE LONDON QUARTERLY REVIEW for April, closes the 92d volume of that work. Its articles are Scrope's History of Castle Combe; Human Hair; The old Countess of Desmond; Hungarian Campaigns—Kossuth and Georgie; Search for Sir John Franklin; Buckingham Papers; Apsley House; The Two Systems at Pentonville, and Manrel on the Duke of Wellington. New York: Leonard, Scott & Co. DEWEY, agent.

AMERICAN POLYTECHNIC JOURNAL.—This is a new monthly devoted to Science, Mechanic Arts and Agriculture, conducted by Messrs. C. C. Page, J. J. Greenough, and C. L. Fleishmann: opposite Patent office, Washington, D. C.: also, published in New York. It was commenced on the first of January, and has been issued regularly, at the first of the succeeding months. Terms, $3 per annum. All lovers of the Arts and Sciences will find this journal worthy their specific attention. DEWEY is agent for this city, and will mail it to those who desire it, on the aforesaid terms.—w.

THE CHRISTIAN REVIEW, number 72, comes well filled with good articles. The one on "The Utility of Classical Studies," by Prof. GALLUP, Madison University, will be read at this time with interest. Prof. G. is a friend of thorough education. The Review is published quarterly by Colby & Ballard, New York. $3 per year.—w.

BIBLIOTHECA SACRA.—Number thirty-eight, like its predecessors, is richly freighted with scholarly productions upon topics which interest all who think upon ethical, educational and religious subjects. Published quarterly by W. F. Draper & Brother, Andover, Mass. $3 per year.—w.

CATCHING SHADOWS—Of the "human face divine," is the daily occupation of many Daguerrean artists in this city, several of whom are said to succeed admirably. Among them all, we know not a greater adept than our friend WHITNEY, in Gould's Block, State street. His long experience, and superior facilities, render him *au fait* in the business—while his rooms, which contain a large number of Daguerreotypes, paintings, etc., are alone worth visiting, by those artistically inclined.

☞ The articles in our paper last week, under the Agricultural head, entitled "*The Manufacture of Butter*," and "*Raspberries*," should have been credited to the *Rural New-Yorker*, one of the best papers published in the United States. It was entirely an oversight that they were not so credited.

IT would be very much to the credit of sundry other newspapers, east and west, if they would follow the example set above by the Albany *Temperance Courier*,—an excellent paper, by the way, and one with which Father CHIPMAN is editorially connected.

☞ On the 30th of April there were in deposite at the offices of the Sub-Treasurers, depositories of U. S. moneys, and the mints, at different points, the amount of $18,760,004, and the nett amount subject to draft was over $19,000,000.—This is a larger amount than has ever been previously reported during the existence of the independent treasury system.

☞ Ohio boasts of the longest lines of Rail Road, and the biggest crop of wheat, of any State in the Union. She had in 1851 a surplus of eighteen millions bushels of wheat alone; a larger amount than the whole exports of the United States of that article. In 1852 she realized the sum of forty millions from the sale of her surplus agricultural productions.

☞ At a Salt Spring near St. Catherines, C. W., twenty bushels of salt were made per day, and it is contemplated in a month or two to extend the manufacture to at least one hundred bushels.—These are the only successful Salt works in Canada.

## News Brebities.

——A Gas Company has been formed in Burlington, Vt., and the works located.

—— The Sandusky river is to be bridged with a Wire Suspension Bridge, at Tiffin.

—— Matches are now split by the most approved machine, at the rate of 60,000 a minute.

——The contributions to the Washington Monument during the month of April, amounted to $2,991.

—— The Boston Young Men's Christain Association now numbers upwards of fifteen hundred members.

—— The Artesian well now being bored at Charleston, S. C., has already attained the depth of 1061 feet.

——A hog from Vermont said to weigh 1150 pounds, and two years and eight months old, is now in Boston.

—— The shock of an earthquake was felt at Wheeling, Va., on the 2d instant. Several buildings were shaken.

—— Of so obscure birth was the Duke of Wellington, that the exact time and place of the occurrence is not known.

—— There is much difficulty in living at Paris at present, and more distress than formerly among people of small fortunes.

—— New potatoes, from Bermuda, are selling in New York for 37½ cents per peck, and tomatoes for 37½ cents per quart.

—— There are 117 newspapers printed in the State of Indiana—more than in all the world before the American Revolution.

—— The number of accounts of stock in the Bank of England is 264,470; and the number in the name of two or more holders 117,828.

——The Boston, Concord and Montreal Railroad has been completed from Concord to Wells River, a distance of 93 miles from Concord.

——Washington letter writers say that it is probable the government will not join with Great Britain in a joint protectorate over San Juan.

——A tent is about to be erected in the vicinity of the Crystal Palace, in which there will be preaching every Sunday during the summer.

—— Samuel Appleton, Esq., has made a gift of Loring's Hundred Boston Orators to libraries of Colleges and Academies in the United States.

—— The total number of persons arrested and brought before the Police Magistrates of Albany, during the year ending April 30th, was 4,254.

—— The Woman's New York State Temperance Society will hold its first annual meeting in this city, on the 1st and 2d days of June next.

—— England will send 542 objects to the New York Crystal Palace, France 826, the Zollverin 500, Holland 142. Italy will send 100 statues.

—— The Boston Atlas, of a late date, contains the valedictory of Col. Wm. Schouler, after fourteen years connection with the newspaper press.

——The public debt of Canada is between $23,000,000 and $24,000,000. It comprises various loans, the longest of which has twenty-eight years to run.

—— Emperor Soulouque, of Hayti, has sent articles for the World's Fair at New York—among them a single piece of mahogany weighing nearly three tons.

——A Railway tubular bridge is now being constructed across the Nile. The trains are to run along the top of the tube. The engineers are Englishmen.

—— The bed-chamber of Napoleon, at St. Helena, is now a stable, and the room in which he breathed his last is used for threshing and winnowing wheat.

——In many parts of Illinois the wheat crop is entirely killed, so much so that thousands of acres will be plowed up and sowed in spring wheat, or planted in corn.

——A correspondent of the Richmond Enquirer says that the cholera is prevailing in Clarkesville, Mecklenburgh, and on some of the plantations on the Roanoke river.

——An Italian paper describes a boquet sent to the church of Sau Ambrosia on Good Friday, as measuring six yards in circumference. It contained 340 camelias.

—— From monthly tables, just issued in England, it appears that in the month ending the 5th of March, there were 6,090,725 eggs imported into the United Kingdom.

—— The Washington Union contradicts by authority, the rumor that the President is about to visit New Hampshire. He will not leave Washington this summer.

—— It is said that the Postmaster General will cut down the number of special post office agents to four. He has already reduced the salaries of some of the route agents.

—— It is said to be the opinion of the celebrated guides who have for years traveled the plains on the Pacific slope, that a Railroad across the country to the Pacific is entirely practicable.

—— The City Temperance Alliance in New York city are going to have a large tent erected near the Crystal Palace for the delivery of lectures. They will not suffer for lack of occupation.

—— By a recently enacted law of Illinois, the railroad companies whose carelessness caused the late terrible destruction of passengers will be obliged to pay the sum of $5,000 for each life sacrificed.

—— At the last session of the Pennsylvania Legislature, thirty one new Railroad Companies were chartered, seventy eight new supplements to other Railroad Companies, and ninety more for incorporating plank roads.

—— The Chicago Democratic Press says, the number of the injured by the late Railroad collision, is much larger than was first supposed. It is now ascertained that there are from forty to fifty that are more or less injured.

—— The Buffalo Commercial says altered bills on the Buffalo City Bank have made their appearance. The ones have been altered to fives, and two's to tens. There is no similarity between the counterfeit and the genuine.

——About 50,000 sheep were driven from New Mexico to California last year. They were purchased at the rate of $2 per head, and sold for from six to eight. More than 75,000 will be driven this year. It takes about 100 days to make a trip.

—— There have just landed from the steamship Humboldt, one hundred and eleven sheep, of the improved Merino stock,—remarkable for their large size and weight of fleece. They were imported by Solomon W. Jewett, of Middlebury, Vt.

—— Capt. Ringold, commander of the North Pacific exploring expedition, has received his instructions, and will sail from Norfolk in a few days. The squadron will consist of the sloop-of-war Vincennes, brig Porpoise, and propellor John Hancock.

# Foreign Intelligence.

## Arrival of the Asia.

The Asia arrived in New York on the 5th inst. The following summary of he intelligence is from the Daily *Tribune:*

Our dispatches from Europe by the Asia, though interesting, bring intelligence of no event of absorbing importance.

England.—Mrs. Stowe has been received with a great demonstration of enthusiasm by the people of Edinburgh with the municiplal authorities at their head. In the House of Lords the Earl of Clarendon has stated that a British fleet will be sent to the colonial fishing grounds this summer to stop the encroachments of American fishermen, and that both Mr. Webster and Mr. Everett were ready to negotiate for reciprocal free trade with the Colonies, though no treaty was made by them. Mr. Gladstone's budget is much discussed in the British journals, though it has not yet been taken up in Parliament. Its extension of the income tax to Ireland and to incomes of £1000, is a highly objectionable feature which may very possibly defeat it, in which case the Ministry will dissolve Parliament. Should they do so, they will only prolong their own dissolution, which may be regarded as inevitable at no very distant period.

Holland.—In Holland the Ministry has gone out of office on the question of favoring the establishment of Catholic Bishops in the country; a more rigid Protestant Cabinet succeeds.

Spain.—It is said to be doubtful whether the new Ministers of Spain can hold their places; the people are very much excited on acccount of the attempts to subvert the Constitution made by Brave Munillo and Roncali, the last two Premiers, and it will not be easy to satisfy them.

France.—In France there is nothing of moment; except it be the evidence of what was known before, namely that the people have no real attachment or respect for Louis Napoleon; when, riding with him to the theatre, the Empress is grossly insulted by persons in the crowd along the street.

In Germany there is nothing new but table-moving.

Turkey.—We have no intelligence except that a riot has taken place at Constantinople, in which several Christians were killed, and the military were obliged to interfere to restore order.

Russia.—The Russians report that they have suspended their extraordinary operations in the South-East, near the Turkish frontier,—doubtful,—and alone that they have gained something of a victory over the Circassians—more doubtful still.

# California News,

## Arrival of the Steamer El Dorado.

The steamer El Dorado, from Aspinwall April 28th, arrived at the quarantine on the 8th inst.

She brings 300 passengers and $50,000 in freight, with California dates of April 9th.

The outward passengers by the Illinois arrived at Panama in eight days and a half from New York. The shortest time yet made. Health at Aspinwall good, and business flourishing.

Nothing further of importance from the Isthmus. News from California uninteresting.

Flour selling in small lots at $11 50. Large sales were making in provisions. Pork $37, 12½; Bacon $22; Hams $22, 60@23, 50; Butter, prime choice, 42c. Cheese 28c. Mackeral, half bbls., $8,00.

The subscription at San Francisco for the sufferers on board the Steamer Independence had been so ample that the committee had a large surplus on hand, and had declined offers from Catharine Hayes and others, of further aid.

Legal proceedings had been commenced in the Supreme Court against Capt. Sampson of the Independence.

Advices from Sacramento state that nearly all the gardens and ranches on the river below the city, were more or less injured by the overflow, and the crops in many of them ruined.

A report from Humboldt states that sixteen of the eighteen men who were exploring a road to Rogue River Valley, have been murdered by the Indians.

The steamer Oregon, recently on the rocks, was again running her usual trips.

President Pierce's inaugural was published on the 4th, and elicited general commendation.

News from the mining region continues to be satisfactory.

## Still Later.

The Daniel Webster arrived at New Orleans on the 9th inst., with California dates to the 16th of April. The news is brief and sad. The steamer Jenny Lind had exploded near San Francisco, and fifty or sixty passengers were terribly scalded, ten of whom have since died, including seven children, and one whole family.

The steamer S. S. Lewis ran ashore on her passage from San Juan to San Francisco. The passengers, 400 in number, all got safely ashore. The baggage was saved, but the stesmer and every thing else is a total loss. Whole amount of loss $200,000.

The markets at San Francisco show but very little change.

---

New York Central Railroad Company—Is the style and title by which the consolidated roads from Albany to Buffalo are to be known. The Evening Journal says the committee on behalf of the several roads recommend the Directors of the respective Companies should meet on the 17th inst. to execute the agreement, and that the Stockholders meeting to ratify the same shall be held on the 29th of June next, at such place as the respective boards should appoint. The first election is to be held on the 6th day of July next, at the City Hall in Albany.

---

The Ericsson.—This vessel lies at her dock at Williamsburgh, and is undergoing alteration in her machinery. The cylinder heads, which were originally of wrought iron, and too elastic to sustain full pressure, will be replaced by those of cast metal. She will be ready to sail on her first trip to London about the first of July. Capt. Ericsson and some of the principal owners go out in her to Europe.

---

Hops.—There is still a large quantity of hops in the hands of the growers, in this county and Madison. The prices remain nearly the same as quoted for the last six weeks—and there is a diversity of opinion as to the probability of any material advance. If the season proves favorable, there will be more hops raised this year than any former one.—*Cooperstown Journal.*

## The Railroad Tragedy at Norwalk.

LIST OF THE KILLED.

Below we give a list of the persons whose bodies had been recovered, and recognized, up to Sunday evening last.

Anna B. Lang, residing in Boston, Mass.; Dr. Josiah Bartlett, Stratham, N. H.; G. R. Sparks, New York; Dr. A. L. Pierson, Salem, Mass.; B. F. Lozier, Dundas, Canada West; Susan Pomeroy, Stockbridge, Mass.; Miss Emeline Sheppard, Boston; Julia Anderson, do.; Mary E. Robbins, Lenox, Mass.; Francis Sayles, Boston; Robert Steinham, New York; Nathaniel King, (or Ring) Athens, O.; Rev. Oliver Barr, Yellow Springs, O.; Joseph M. Hill, New York; Dr. William C. Dwight, Moscow, Liv. co., N. Y.; A. L. DeSaugue, Wilmington, Del.; Miss Ann T. Greene, N. York: Rev. John H. Luhrs, Williamsburg, L. I.; D. W. Dimmick, Mansfield, Conn.; Isaac P. Colbath, Richmond, Me.; Beverly Parkess, Yorkville, N. Y.; Alice Carrigan, New York; Dr. Samuel Beach, Bridgeport, Conn; Dr. John O. Gray, Springfield, Mass.; Walter French, Manchester, N. H.; Norman Parker, Woodbury, Ct; John M. Hutchinson, Boston, Mass.; Dr. Welch, Hartford, Conn.; B. W. Offendock, Wooster, Mass.; S. N. Hazzard, Yonkers, Westchester Co., N. Y.; Miss Ellen Goss, Poughkeepsie, N. Y.; Miss Ellen S. Bacon, Boston, Mass.; Jacob G. Vandeventer, New Jersey; Mrs. Maria Fluent, Lancaster, Pa.; Mrs. Hannah, New York; Dr. Abel L. Pierson, Salem, Mass.; Dr. J. M. Smith, Springfield, Mass.

Eight other bodies were at this time lying in the depot. Among them were supposed or known to be the following: Mrs. Harler, her infant daughter and domestic, Baltimore; David B. Newell, Newport, R. I.; Martin Tine, New York; Miss Caroline Sawyer, New York, and two others, unknown.

---

Rochester, Lockport and Niagara Falls Railroad.—The Springfield Republican of May 3d, says:—Two splendid passenger cars and one beautifully fitted up smoking car will leave the manufactory of T. W. Wason, in this city, this morning, for their destination — the Rochester, Lockport and Niagara Falls Railroad. More elegantly finished cars we have never seen. The passenger cars are decorated, upholstered, and appointed throughout with something beyond mere neatness and convenience—they give evidence of the employment of high artistic taste. The smoking car is a curiosity. It is furnished with a row of fine arm chairs on each side, which turn on a stationary pedestal—with a gentleman's saloon—and with a standing case for keeping cigars.—These cars complete the number of 21 already finished for that road by Mr. Wason.

---

☞ A block of fine white marble, 6 feet long by two and a half feet wide, has just been finished in Washington for the National Washington Monument. An open Bible in alto-relief is displayed on the centre, with the words, in raised letters on each side of it, "The General Assembly of the Presbyterian Church in the U. States of America, in session at Washington City, May, 1852." The Assembly made a liberal appropriation for this stone, the design of which was furnished in a resolution passed by that body.

---

☞ The *fast* trains on the Hudson River and Central line of Railroads now run from N. York to Buffalo in 14 hours, including half an hour at Utica for dinner. At Buffalo immediate connection is had with the boats for the West and with the Lake Shore Road. The fare on this ronte has been put down between Albany and Buffalo to $6, so that passengers by boats reach Buffalo from New York at an expense of $6,50, and by Hudson River Railroad at a cost of $7,50.

---

☞ Professor Sheppard, while in Charlotte, N. C., a few days since, was presented with a diamond, by Dr. Deventhorpe. That gentleman had lately discovered it on his estate at Pioneer Mills, and this is the second specimen of this precious gem found within the year in the country. Hitherto no special search has been made for the diamond, these specimens having been discovered in a manner purely accidental.

THE WOOL GROWER AND STOCK REGISTER:
A MONTHLY JOURNAL
**Devoted to the Wool and Stock Growing Interests.**
VOLUME V,—FOR 1853-4.

The large measure of support which has been accorded to this Journal during the past year, encourages the Publisher to make commensurate effort and expenditure to improve the forthcoming volume. The Fifth Volume, commencing with July, 1853, will, therefore, be enlarged by the addition of eight pages (for notices, items, advertisements, &c.,) and improved in Contents and Appearance. The design is to render the work invaluable to all growers of Wool, and every Stock Breeder, Grazier, Dairyman, &c.

As the Wool Grower and Stock Register is the *only* journal in America devoted primarily to the important and profitable interests of Wool and Stock Growing, &c., it should be in the hands of

**Every Owner of Domestic Animals,**

whether located East or West, North or South, for the subjects discussed in its pages are interesting in all sections of the Union, the Canadas, etc.

The ensuing volume will contain a large amount of useful and reliable information in regard to Wool and Stock, not given in any other publication. The monthly *Review of the Wool Market* is made ont with great care and entirely idependent—designed for producers instead of speculators,—and consequeutly alone worth many times the price of the paper to any wool grower. In the Stock Department we shall describe and discuss the merits of the various breeds of Domestic Animals, and give Pedigrees and life-like Portraits of superior Cattle, Horses, Swine, Fowls, &c.; important information on Dairying, the Diseases of Animals, &c.,—notice the principal importations and sales of improved stock—carefully Review Cattle Markets, &c.

**Form, Style and Terms:**

The Wool Grower and Stock Register is published monthly, in Octavo form, with Title Page, Index, &c., at the close of each volume. The Fifth Volume will be published in the best style, and illustrated with numerous valuable and appropriate Engravings—embracing Portraits from life, of Sheep, Cattle, Horses, Swine, Poultry, &c.—Designs of Farm Buildings, etc.—with proper descriptions.

**Terms**—In Advance:—*Fifty Cents a Year. To Clubs and Agents,—Five copies, $2; Eight copies, $3; Eleven copies, $4; Twenty copies, $7, and any additional number at the same rate. The three first volumes, bound, at 40 cts. each,—unbound at 35 cts., or the three for $1.*

Subscribers and friends of the work, Post-Masters, and others, are respectfully solicited to lend a portion of influence in its behalf. We trust that each and all who can consistently do so, will form clubs in their respective localities, from Maine to California.

☞ Now is the time to Subscribe,—as all subscriptions should commence with the volume. Bills of all specie paying banks, and postage stamps, received at par. Money, properly enclosed, at our risk,—if addressed to

D. D. T. MOORE, Rochester, N. Y.

# Marriages.

At Richmond, on the 5th inst., by the Rev. B. G. Riley, Mr. ASA PRIDE, of Honeoye Falls, and Miss ALTIC C. REED, daughter of Silas Reed, Esq.

At the Clarendon, Buffalo, on the 3d inst., by Rev. G. W. Hescock, C. K. JUDSON, Esq., Editor of the Randolph Whig, and Miss LUCIE INGERSOLL, of Clarendon, Orleans, county, N. Y.

# Market Intelligence.

Rural New-Yorker Office,
Rochester, May 11, 1853.

The transactions of the week just passed, have been of a limited character. The best feeling has prevailed, but the little produce offering prevents any animation in the market. Farmers are unusually busy, the backward spring having kept them from earlier completing the usual seasonable labor.

Flour—At this season transactions are light, confined mostly to home demand. Sales are within the range of our quotations.

Grain—A small quantity of wheat only is offering.—Sales of the week have been very light. The demand for city grinding is active, which leads to paying quite as good prices as the state of the market will warrant. All good samples readily command $1,12½, and in some cases $1,15 has been paid. Corn is in good request at 58@60c. for choice yellow. Oats are very scarce, and we learn 41c has been paid in the street, which is nearly as high as N. York quotations. In other grains a general quiet prevails.

Seeds—The season for Clover and Timothy is about over, and seldom has the stock been used up as closely.

Vegetables—Apples are getting near "out of season" unless one is fortunate enough to stumble upon some Roxbury Russets, Northern Spys, or other long keeping varieties. Potatoes are a drug. All the common kinds can hardly find sale, while White Mercers, Pink Eyes and other choice varieties, are current at 25@31c. Irish Cups and Wild Mexicau, for seed, sell at $1@2 per bushel.

Market Supplies.—Beef Cattle—The supply is very limited and market-men have difficulty in keeping up a supply. We saw some nice quarters of a good well fattened ox, which the butchers assured us cost $8 per cwt.

Pork—Of Pork the market is nearly bare, except those killed by the butchers. If farmers have some fat shoats, now is the time to market them. They sell at $7@7,50.

Veal Calves—The supply is fair, and those of good quality command $3,50, 4, 5@7,50.

Mutton Carcasses, are very scarce. Just at this season farmers would do well to provide a supply of this delicious meat.

Poultry is scarce and high as will be seen by quotations.

Fish—Fresh Fish are abundant and cheap.

Provisions—Pork is in some demand, and sales are made at full quotations. Ham sells at 10@11c.; Shoulders 8@9. Butter, owing to the cold weather is not very plenty; best samples command 13@15c. in the street. Eggs 10c.

Hay—The supply at market was moderate. Sales at our rates as per quality.

In other departments the market presents no great activity; any change in prices will be indicated by the table annexed.

**Rochester Wholesale Prices.**

| | | | |
|---|---|---|---|
| Flour, bbl. | $4,88@5,25 | Butter, lb | 13@15c |

## NEW YORK MARKET.

New York, May 9, 7 P. M.—Ashes—Market quiet at $5 for Pots, and $5,50 for Pearls.

Flour—Large arrivals from the west. The demand not active. Canadian, $4,69@4,75; common to straight State, $4,56@4,62; mixed to fancy Michigan and Indiana $4,62@4,87; common to good Ohio $4,69@4,87. Rye flour $3,75. Corn meal $2,94@3.

Grain—Wheat in good supply, and market not so firm; White Ohio and Michigan $1,20; Red Ohio, Mausfield $1. Rye heavy, 87½c. Barley unsaleable at 63@70c. Oats brisk 44@46c for State and Western; 42@44c for Jersey.—Corn in good demand; New Orleans damaged, 60@61c; mixed Southern 63@64c; white 64@65; Jersey and Southern yellow 67@68c.

Provisions—Pork dull at $15,19@15,25 for mess; $13,25 for prime. Beef, country and city prime $5@6,62; mess $9@10,50. Beef hams $12,50@14,50. Shoulders 5¾@6¼ Hams 8¾@9¾. Lard 9½@10. Butter and Cheese, unchanged.

## ALBANY MARKET.

Albany, May 9.—Flour—The market shows an advance of 6¼@12½ cents. Common to good State $4,56@4,69; Michigan and Indiana $4,69@4,94; extra Western and State $5@5.37; extra Genesee $5,50@5,87.

Grain—Good demand for wheat, with moderate arrivals, holders firm; white Michigan $1,19; good Genesee $1,27, views of buyers $1,26@1,26½. Corn arrives slowly, demand good; Western mixed 65½c; round yellow 66c.—Barley, no change, two rowed sold at 70c. Oats coming in freely, 45c for Canadian; 46c for State.

Feed—Supply fair. Middlings $1 per 100 lbs. Screenings 75c. do. Hay, pressed, 70@80.

Seed—Clover quiet 10½@11 for medium, 11½@12 for large. Timothy $2,50@3. Hops 19@21 for medium to prime sorts.

Provisions—No change in Beef and Pork, and only a moderate trade. Butter and Cheese, saleable at former rates.

## BUFFALO MARKET.

Buffalo, May 9.—The obstructions to canal navigation operate unfavorably on the Buffalo market.

Flour—Holders firm at previous rates; Ohio common to fancy brands $4,12½@4,37½.

Grain—No Transactions in wheat. Price nominally 95@1,05. Corn quiet, sales at 52c.

## NEW YORK CATTLE MARKET.

NEW YORK, May 2.—At Washington Drove Yard—At market, 2,000 Beef Cattle—1,500 Southern and Western, remainder from this State. All but 100 disposed of, at prices ranging from 8@10 per cwt.

At Browning's—In market 1,200 Sheep and Lambs,—all sold at prices ranging from $4@6 for common quality Sheep, and extra at from $8@10; prices of Lambs at from $3,50@6.

Cows and Calves—75 offered, and all sold at from $24 to $35@45.

At Chamberlain's—Offered, 350 Beef Cattle. Prices ranging from 7½ to 9½c.

Cows and Calves—60 offered, and all sold at prices ranging from $25 to 35@50; one extra at $70.

Sheep—1,200 offered; all sold at from $3@4.25 to $6.50 for Sheep, and $2@3,50 to $5 for Lambs; a lot of extra Sheep sold at $10.

## ALBANY CATTLE MARKET.

ALBANY, May 2.—Woolford's Bull's Head—At market, 450 Beef Cattle. Prices extra, $7; 1st quality $6,50; 2d do. $6; 3d do. $5,50.

Cows and Calves—20 in market. Prices from $20, $25 to $35.

Sheep—300 in market—Prices, $5, 5,50@7.

Swine—378 in market—Prices, $5@6.

ALBANY, May 9.—W. W. Woolford's, Bulls' Head, Washington street.

Beef Cattle—At market, 350. Prices—Extra, $7,50; 1st quality, $7; 2d do, $6,50; 3d do, $6.

Cows and Calves—27 in market. Prices from $25, 30, 35, 40.

Sheep—200 in market. Prices from $5, 5,50, 7. All sold.

Swine—160 in market. Prices from $5, $6. All sold.

## CAMBRIDGE CATTLE MARKET.

CAMBRIDGE, May 4.—At market, 692 Cattle, about 600 Beeves, and 92 Stores, consisting of Working Oxen, Cows and Calves, yearlings, 2 and 3 years old.

Prices — Market Beef—Extra, per cwt. $8,25@8,50; 1st quality, $8; 2d do, $7,50@7,75; 3d do, $7@7,25; ordinary $6,50@6,75.

Hides—$4,75@5 per cwt.

Tallow—$7@7,50 per cwt.

Pelts—$1@1,50.

Calf Skins 10c per lb.

Veal Calves—$2,50@7; 413 at market.

Stores—Working Oxen—$99, 102, 105, 107@159.

Cows and Calves—$24, 29, 33, 44@51.

Yearlings—$12, 14@16

Two years old—$32, 35, 40@49.

Three years old—$42, 51, 64@72.

Sheep and Lambs—1,155 at market.

Extra, $7, 8, 9@12,75.

By lot—$4, 4,50@6,50.

Swine—Wholesale, 246. Hard fat, Hogs at 6c.

Remarks—The market is firm at quotations; but the sales are both slow and hard, as buyers take no more than what they are actually obliged to, to supply their regular customers.

## BRIGHTON CATTLE MARKET.

BRIGHTON, May 5.—At market 775 Beef Cattle, 20 pairs Working Oxen, 45 Cows and Calves, 1,350 Sheep, and 5,200 Swine. 2,000 Swine and 40 Beef Cattle were reported last week.

Prices—Beef Cattle—No advance from last week on beef cattle of a like quality. Some extraordinary cattle were at market; we noticed 57 offered by Nath'l. Lynch, Esq., of Auburn, N. Y., and fed by Messrs. Legg & Earl, of Skaneatles, N. Y. They were the best 57 cattle we have ever noticed in this market in one lot, sold for about $107 each, probably over $9 per cwt. We quote extra, $8@8,50; 1st quality $7@7,75; 2d do, $6.25@6,75; 3d do. $5@5,75.

Working Oxen—Sales at $75, 99 108, 115, 140 and 155.

Cows and Calves—Sales $22, 27, 30, 37 and 48.

Sheep and Lambs—$3,50, 4,75, 6,50, 7@8,25.

Swine—Prices have declined; lots to peddle 5½@5¾ for sows, 6¼@6¾ for barrows; selected lots 6 and 7; large hogs 5⅝, 5¾, 6@6¾. At retail from 6 to 8.

---

Bird Fancier; Amer. Rose Culturist; Pests of the Farm; The Horse; The Cow; The Hog; Domestic Fowls and Ornamental Poultry; The Hive and the Honey Bee.

**Mexican Wild Potatoes.**

Editor Rural:—Please say to your subscribers that the crop of Mexican Wild Potatoes is all sold, with the exception of what we have reserved for planting. This will save them the risk of sending money to us by mail and save us the trouble of returning it.

Also, please caution them of whom they buy potatoes, purporting to be the "Mexican Wild" The White Mercers have been offered, even in the village of Lyons, as the Mexican; and the farmer said he obtained his seed of the Shakers. In another village the Cow-horn have been sold for Mexican Wild, and in another place, a large blue potato has been offered as the genuine Mexican.

A. Hale, Alloway.
E. Ware Sylvester, Lyons.

Lyons, N. Y., May 4, 1853.

☞ The genuine "Mexican Wild Potato" can still be obtained of Briggs & Bro., at the Monroe Seed Store and Agricultural Warehouse, No. 68 State st., Rochester, N. Y.

**NORMAN HORSE LOUIS PHILIPPE!**

THIS Celebrated Horse, owned by Robert B. Howland, of Union Springs, Cayuga Co., N. Y., and bred by Edward Harris, of Morristown, New Jersey, from his pure imported Norman Stock, will he kept the present season at the following places, to wit:—On Mondays, Tuesdays and Wednesdays of each week, at the stable of R. B. Robinson, in Farmington, Ontario county; on Thursday, at Victor village; on Friday, at Fairport, Monroe county, and on Saturday, at Egypt.

Terms:—$8,00 for the season, and $10,00 to insure.—Mares to be returned to the Horse once a week, or until the groom is satisfied they are with foal, and to be, in all respects, at the risk of the owners. Pasturage furnished at four shillings per week. JOS. R. ROBINSON.
176w6*

**YOUNG HIGHLANDER**

WILL stand at the stable of the subscriber, 2½ miles north of West Henrietta village, for the season, commencing May 1st, and ending July 10th.

Young Highlander is a beautiful dark mahogany bay, 7 years old, 16¼ hands high, and in strength and beauty cannot he surpassed in Western New York; he was sired by Highlander, that was imported from Scotland. His dam was a Magnum Bonum.

$10 to insure. [176w1*] MEIGS BAILEY.

**SHORT-HORN BULL, FOR SALE.**

I HAVE a fine young Bull, (19 months old,) *thorough bred*, and from good milking stock, which I will sell any time the present month, for $150. His color is white. He has an excellent pedigree. S. P. CHAPMAN.
Clockville, Mad. Co., N. Y., May 3d, 1853. 176w2*

**GLEN HAVEN WATER CURE.**

THIS Celebrated Institution, by the peculiar method of treatment which Dr. Jackson practices, and the success attending it, is greatly attracting public attention throughout the Union. The past year it has been visited by invalids from not less than 20 of the States and the Canadas, and hundreds of persons regarded as incurable, have received immense benefits from its waters.

Those wishing information can receive a Circular, free of charge, and those wishing advice for home treatment, can have it by enclosing $1, post-paid, to

JAMES C JACKSON, M. D.,
175-4t Scott, Cortland Co., N. Y.

**Imported Horse, "Consternation."**

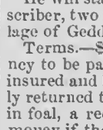
THIS thoroughbred horse has been so often exhibited at the Fairs of the New York State Agricultural Society, and always without a rival, that it is unnecessary either to describe or praise him. Six or seven of his colts, of various ages, were shown with him at Utica last fall. Two of them received first premiums, and all of them were greatly admired. Many of them, now four and five years old, are owned in Oneida county. Any person may be convinced of their great superiority by inquiring of almost any farmer or horseman in the towns of Rome, Lee, or Western. His colts and fillies are already in demand for breeding. Several have been sold during the past winter, at handsome prices, to go out of the State.

His pedigree will be found complete in Derby & Miller's edition of Youatt, and is confirmed in every particular by breeders' a certificates and copies of the English Racing Calendar, and English Stud Book, now in possession of the subscriber.

He will stand the coming season at the farm of the subscriber, two miles west of Syracuse and adjoining the village of Geddes.

Terms.—$10 for the season, and $15 to insure; the money to be paid in advance in all cases. When a mare is insured and left at the farm of the subscriber, or regularly returned to the horse until the groom is satisfied she is in foal, a receipt will be given promising to refund the money if the mare was not got in foal. Pasturage furnished at three shillings per week. Mares to be at the risk of owners in all respects. J. B. BURNETT,
174w8. Syracuse, N. Y.

**MORGAN HORSE "GEN. GIFFORD."**



THIS justly celebrated horse will be kept the preseut seasou at Lodi Village, Seneca Co., New York.

Gen. Gifford received the 1st Premium in the class of Morgans at Rochester, in September, 1851, and is regarded by experienced horsemen as the best living specimen of this invaluable breed;—is a perfect model in form, a sharp goer, and style and action unsurpassed. Terms of insurance, twenty dollars. CHARLES W. INGERSOLL.
Lodi, April, 1853. 164w8

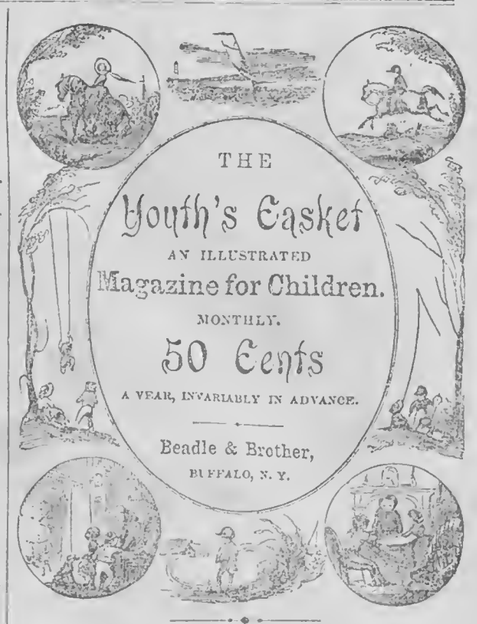
**GREAT PRIZE MEDAL.**

THE WORLD'S FAIR AT LONDON, awarded us a Mammoth Silver Medal for the Best Hats.—Gents wishing the Spring and Summer style, will call. We are prepared to serve you with a superior article, and of the most becoming style.

CLARK & GILMAN, 23 State St.,
[169-3m.] Rochester N. Y.

**SALE OF SHORT-HORNS.**

I WILL sell by Auction, on Wednesday, 8th June next, at 1 o'clock, P. M., about Thirty of my improved Short Horned Cattle, mostly all the get of my imported Bull.—Up set price from $150 to $300. [169-9t*]
Auburn, N. Y., March, 1853. J. M. SHERWOOD.



**AGENTS WANTED!**

The Casket is now fairly established, and the success of the enterprise beyond doubt, which enables the publishers to enter with renewed vigor into measures for extending its circulation. We feel very thankful for the many flattering compliments which we are daily receiving from private letters and the press, all of which agree in pronouncing the Casket the

**Cheapest Juvenile Magazine in the World.**

And that all our little friends, that every boy and girl may have the pleasure of perusing our magazine, we want *Ten Thousand Agents* to canvass for, and circulate the Casket, in every school-district, town and county, in the United States and Canadas, to whom a liberal percentage will be given. Specimen numbers furnished *gratis* on application. Send for one number and circulate it among the *little folks*, and you will confer a greater blessing than distributing gold and silver. Try it.

Address, *post-paid*, Beadle & Brother,
*Buffalo, N. Y.*

**Manny's Patent Adjustable Northern Illinois REAPER AND MOWER.**

First Premium Machine for 1853.

AWARDED the First Premium for Mowing and the second for Reaping, at the N. Y. State Fair, in the great trial at Geneva, N. Y., in July, in competition with eleven other machines; awarded a Silver Medal at the Ohio State Fair, for the best Reaper and Mower, and received the highest award at the Vermont and Michigan State Fairs, for the best Reaping and Mowing Machine.

The true merit of this Machine has given it a great triumph over all others, and being a perfect combination of Reaper and Mower, it comes to the farmer with double value, and it is clearly demonstrated to be the only successful combination of Reaper and Mower. As a Mower, it is as simple and perfect as though constructed expressly for mowing; and as a Reaper, it is as simple and perfect as if constructed for reaping only. All the change that is necessary from one plan to the other, is to insert or remove a loose platform.

Machines warranted to cut all kinds of grain as well as can be cut with a scythe, and to cut flax and millet, also to 'gather clover, timothy and flax seed, and to be well built and of good materials. This machine will cut from ten to fifteen acres per day, with two horses, and one person to tend it when mowing, and two persons when reaping. The cutting apparatus is made perfect by means of a double edged sickle, and double guards, as fully tested the last two years, and it is connected with a joint, so as to adjust itself to uneven ground, and by a level at the driver's seat, it can be raised when moving along, to cut from one inch to two feet from the ground. All side draft against the team is entirely avoided. The machine will turn square corners, and turn square about, either way. Over three hundred of these machines were in use the past season, all of which gave perfect satisfaction.

The machines are manufactured at Hoosick Falls for the State of New York, and I will have them delivered to any part of Western New York where ordered. Price of machine, where made, $125. Address Gen. R. Harmon Wheatland, Monroe Co., N. Y.

The machine is for sale by D. R. Barton, Rochester.
173-tf. R. HARMON, Agent.

**PEAS! PEAS! PEAS!**

WE most respectfully call the attention of Farmers and others to our extensive assortment of Field and Garden Peas; among the former are

200 bushels Common Marrowfats.
400 do. Junes.
200 do. Goldeu Vine.
200 do. Creepers.
400 do. Common Canada.

And among the latter are

25 bushels Superior Early Kents, earliest grown.
5 do. Prince Albert.
100 do. Early Warwick—superior.
200 do. do. Washington.
100 do. Marrowfats, superior article.
50 do. Black Eye Marrowfats.
25 do. Dwarf Blue Imperial.
10 do. Monastery Marrow.
25 do. Blue Marrowfats.

Also, various other choice kinds,—all of which will be sold at small profits for cash, at the Genesee Seed Store 63 & 65 Buffalo st., Rochester.
172-tf J. RAPALJE & CO.

**HALLOCK'S HAND SEED DRILL.**

THIS Drill is adapted to sowing carrot, turnip, beet, onion, and other small seeds in drills, with perfect regularity and without regard to their weight or shape.—The seeds are forced out by a circular brush, which revolves against a perforated tin plate inserted in the bottom of the hopper. A series of these plates accompany each drill, with holes of different sizes for regulating the quantity and kinds sown. It is a light, compact, and durable machine, and not liable to get out of order. They can be forwarded to any part of the country by railroad or stage. Remittances by mail at my risk. All orders (which should give full directions for forwarding,) promptly attended to.
Price, $5. Address E. D. HALLOCK,
168eowtf. Rochester, N. Y.

MONEY TO LOAN on Bond and Mortgage, on improved farms. L. A. WARD,
[169m6.] 36 State St., Rochester, N. Y.

**Important to Farmers**
**PORTABLE MILL.**

[From the Ohio Farmer, December 2, 1852.]

Ross' Improved Patent Conical Burr Mill Stones.—Our readers will many of them remember that Ross' Portable Burr Stone Mill took the First Premium at the Annual State Fair, held in this city a few weeks since.—This admirable invention must commend itself to every one who has witnessed its operation. In the first place it is easily portable, simple in structure, does not easily get out of order, and does its work with great rapidity and perfection. It may be used for grinding the coarsest food for cattle, or the finest meal for family use. It is also well adapted for grinding wheat, rye or buckwheat. It is indeed a perfect grist mill in miniature, and we would advise every farmer, if possible, to procure one. The expense of one of these mills, with the apparatus for horse power, can not be very great; or a number of farmers might club together and procure one, which would be sufficient for all.

Mr. Ross is, we believe, a resident of Rochester, N. Y.

N. B.—Any further information relative to the Conical Mill can be obtained by letter, post-paid, or by calling at the factory of CHARLES ROSS,
2d story Phenix Building, Aqueduct-st.,
154-tf opposite the Arcade, Rochester, N. Y.

**MORGAN HORSE "Z. TAYLOR,"**

**For Sale.**—Morgan Stud "Z. Taylor;" deep bay color, (perfect figure of the old Gifford,) three years old next 8th June. Also a fast mare, (dam of "Gifford Morgan,") in foal by Morgan horse "Gen. Gifford."
March, 1853. J. DORR, Scottsville, N. Y.

## SPARE MY HEART FROM GROWING OLD.

BY CHARLES A. HITCHINGS.

Old Time, I ask a boon of thee—
Thou'st stripped my heart of many a friend,
Ta'en half my joys and all my glee—
Be just for once, to make amend;
And, since thy hand *must* leave its trace,
Turn locks to gray, turn blood to cold—
Do what thou wilt with form and face,
But spare my heart from growing old.

I know thou'st ta'en from many a mind
Its dearest wealth, its choicest store,
And only lingering left behind
O'er-wise Experience' bitter lore.
'Tis sad to mark the mind's decay,
Feel wit grow dim and memory cold—
Take these old Time, take all away,
But spare my heart from growing old.

Give me to live with Friendship still,
And Hope and Love till life be o'er—
Let be the first the final chill
That bid's the bosom bound no more;
That so, when I am passed away,
And in my grave lie slumbering cold,
With fond remembrance friends may say,
"His heart, his heart grew never old."

# Rural Sketch Book.

## THE TWO MOTTOES.

### "CHARITY" vs. "MY RIGHT."

In the coach-office at Cernay stood two young men, who had just taken their places for Kayserberg. They were of the same age—each about four-and-twenty; but there were remarkable differences in their physiognomy and general appearance. The shorter of the two was dark, pale, and quick in his movements, and of an impatient vivacity of manner which betrayed, at a first glance, his southern origin. His companion, on the contrary, tall, fair, and ruddy, was a perfect type of that mixed Alsatian race, in which French expansiveness is happily blended with German good humor. On the ground at their feet were two small portmanteaus, upon which cards of address were fastened with sealing-wax. On one of these cards was inscribed

Henry Fortin, *Marseilles;*

and at its four corners a seal had impressed upon the wax the motto *Mon Droit.*

Joseph Mulzen, *Stratsburg;*

and the motto of the seal was *Caritas.*

The office-keeper had entered their names in his book, and added the words *with the two portmanteaus,* when Henry demanded that these should be weighed. They would be weighed at Kayserberg, the office-keeper replied. The young man said it would be inconvenient to be delayed by that formality at the moment of their arrival. It was his right, he maintained, to have them weighed at once. The office-keeper, thus hard pressed, grew obstinate in his turn.—In vain did Joseph interfere, and remind Henry that they had barely time to dine before departure. In virtue of his motto, the Marseillese never gave way when he thought he was in the right; and he always thought that. At last the office-keeper, weary of the dispute, beat a retreat, and escaped into his dwelling-house. Henry would have continued the discussion with the porter, but fortunately the porter spoke nothing but German. So he was fain to accompany his friend to the inn, vonting upon him by the way the superabundance of his ill-humor.

"By heavens!" he exclaimed, as soon as they were in the street, "you would make a saint swear. What! you would not back me against that obstinate fellow!"

"It seems to me," replied Joseph, with a smile, "that it was rather he who was in want of a backer; you brought forward as formidable an array of arguments as if your fortune or your honor had been at stake."

"In your opinion, then, I should have done better not to defend my right?"

"When the right is not worth defending."

"Ah, how like you!" interrupted Henry, warmly; "you are always ready to yield; one must be walking over your body before you think of defending yourself. Instead of considering the world a battle-field, you take it to be a drawing-room, for the interchange of courtesies."

"Not so," replied Joseph, "but a great ship, all the passengers by which owe each other reciprocal friendliness and toleration. Every man is my friend until he has declared himself my enemy."

"For my part I consider every man my enemy until he has declared himself my friend," replied the Marseilloso. "It is a prudent system, which I have always found answer, and I advise you to adopt it at Kayserberg. There we shall find ourselves face to face with our uncle's other heirs, who will not fail to appropriate all they can of the inheritance. For my part I am determined to concede nothing to them."

Thus conversing, the cousins reached the White Horse Inn, and entered the public dining-room, which was unoccupied, save by the hostess, who was laying, for three persons only, a large table at one end of the apartment. Henry ordered two more knives and forks to be laid for himself and Joseph.

"I beg your pardon, sir," said the woman, "but you cannot dine here."

"Why so?" inquired the young man.

"Because the three persons for whom we have laid this table desire to dine alone."

"Let them dine in their own room, then," replied Henry abruptly. "This is the public room and the public table; here every traveler has a right to enter, and to dine."

"What matter," said Joseph, "whether we dine here or in another room?"

"And what does it matter to those three persons whether we dine here or not?" retorted Henry.

"They came before you, sir," objected the hostess.

"Then, in your inn, it is the first comers who lay down the law?" cried Henry.

"Besides that, they are persons whom we know."

"And you care more for them than you do for us?"

"You understand, sir, that when customers are in the case—"

"All other travelers must submit to their caprices."

"Your dinner shall be laid elsewhere."

"Yes, with broken meats from your favorites' table, I suppose."

The hostess was hurt by this imputation upon her establishment.

"If the gentleman is afraid of getting a bad dinner at the White House, there are inns at Cernay," said she.

"I was just thinking so," replied Henry quickly, taking up his hat. And without listening to Joseph, who tried to detain him, he darted out of the room, and disappeared.

Mulzen knew by experience that the best plan, in cases like the present, was to let his cousin's ill-humor burn itself out, and that any attempt to reason served only to aggravate his pugnacity. He resolved, therefore, to let him seek his dinner elsewhere, and ordered his own to be served up in an adjoining apartment. But just as he was about adjourning to it, the three expected guests entered the public room. These were an old lady and her neice, and a gentleman about fifty years of age. The hostess, who was telling them what had just occurred, stopped short at sight of Joseph, who bowed, and was withdrawing, when the gentleman detained him. "I am grieved, sir," said he, urbanely, "to learn the dispute that has occurred. In desiring to dine alone, our object was to avoid the society of persons whose conversation and manners might have shocked these ladies. But, certainly, we were far from desiring to drive away customers from the White House, as your friend perhaps believed; and in proof of what I say, I beg you to do us the favor of sitting down to dinner with us."

Joseph would have refused, declaring himself in no way offended by a precaution which he found quite natural; but Mr Rosman (it was thus the two ladies called their companion) pressed his invitation in so cordial and friendly a manner, that he ended by accepting.

The old lady, who seemed little accustomed to travel, sat down opposite to him, with her niece, and heaved a sigh.

"You are tired, Charlotte," said Mr. Rosman.

"Tired indeed?" replied the old woman; "and well I may be, after being shaken up for a whole day in that crazy coach, getting my meals irregularly, and running all manner of dangers; for I know not how we escaped being upset twenty times; the diligence was always leaning to one side or to the other! I would give a year of my life that our journey were at an end."

"Fortunately the bargain is impossible!" cried the young girl, smiling and kissing her aunt.

"Yes, yes, you laugh at my troubles," said Miss Charlotte, in a half grumbling, half affectionate tone; "young girls, now-a-days, fear nothing! They travel by railway and steamboat—they would travel by balloons, if they could get places. It is the Revolution that has made them so bold.—Before that, the bravest amongst them traveled only in carts, or on ass-back, and even then, only when they had pressing business. I have heard my poor mother say that she never would travel in any other way than on foot."

"Yes," observed Mr. Rosman, "and therefore, her farthest journey was only to the chief town of her canton."

"That did not prevent her being a worthy and happy woman," replied Miss Charlotte. "When the bird has built his nest he stays there. The present custom of passing one's time upon the high-road, impairs one's love of home and family; people get a habit of being at home everywhere. It may be more advantageous to society at large, but it renders individuals less good, and less happy."

"Come, come, Charlotte," said Mr. Rosman, gaily; "your late jolting has set you against all journeys, but I hope your discontent will disappear before this excellent soup. I appeal to your impartiality whether a better can be got, even at Fontaine."

The dialogue continued in this strain of affectionate familiarity. Joseph at first maintained a discreet silence, but Mr. Rosman spoke to him several times, and conversation had become general, when the waiter came to say that the diligence was about starting. They paid for their dinner, and hastened to the coach-office.

On arriving there, Joseph saw his cousin hurrying up. Whilst Mulzen had dined, Henry had run from one tavern to another, finding nothing ready at any of them, and at last, pressed for time, he had been fain to buy a roll and some fruit, which he ate as he ran.

As may be imagined, the frugal repast had done little to sweeten his temper.—Joseph abstained from questioning him.—Indeed he had no time, for the way bill was already being called over, and the traveler about to take their places, when the office keeper discovered that he had made a mistake, had booked two persons too many, and that the coach was full without Mulzen and Fortin.

"Full!" cried Henry; "but I paid you my fare!"

"I will return it to you, sir," replied the clerk.

"Not at all," answered the young man.—"Having once taken my money, there is a contract between us. I have a right to a place, and a place I will have."

And so saying, he grasped a strap and ascended the imperial, where was a place as yet unfilled. The traveler to whom it belonged protested against this usurpation; but Henry persisted, declaring that none had a right to make him get down, and that if any attempted it, he should repel violence by violence. Joseph in vain endeavored to compromise the matter; the Marseillese, whose humor had been by no means mended by his bad dinner, persisted in his resolution.

"To every one his right," cried he; "that is my motto. Yours is 'Charity.' Be as charitable as you please; for my part I am satisfied with justice. I have paid for this place; it belongs to me. I shall keep it."

The traveler, whose place he filled, objected his priority of possession; but Henry, who was a lawyer, replied by quotations from the code. There was a sharp interchange of violent explanations, recriminations, and menaces. Miss Charlotte, who heard everything from her place in the *coupe,* groaned and sighed her alarm, and recommenced her diatribes against traveling in general, and public vehicles in particular. At last Joseph, perceiving that the dispute became more and more envenomed, proposed to the office keeper to have a horse put to a cabriolet which stood in the yard, and in which he and the dispossessed traveler would continue their journey. The expedient was adopted by the parties concerned, and the diligence set off.

It was in the month of November; the air, damp and chilly at the moment of departure, grew colder still as night approached. Henry Fortin, accustomed to the sun of Provence, was anything but comfortable in his exposed place upon the top of the diligence. In vain did he button his great coat to the very chin; he shivered like a leaf in the frigid evening fog. His lips were blue, his teeth chattered! Soon a small icy rain, driven full in his face by the wind, penetrated his clothes. His neighbor, protected by an ample blanket cloak, might easily have spared him a portion of it, and been no worse off himself; but the neighbor was a corpulent shopkeeper, very tender of his own person and extremely careless of the comfort of others. When Fortin refused to give up the place of which he had taken possession, the fat man applauded, declaring that "every one traveled for his own account and should look after his own interests;" principles which the young man then found perfectly reasonable, and from whose application he now suffered. About the middle of the journey, the stout traveler put his head out of his cloak, looked at his neighbor, and said—

"You seem very cold, sir?"

"I am wet to the skin," replied Fortin, who could hardly speak.

The fat man shook himself in his huge wrapper, as if enjoying the warmth and dryness it secured him.

"It is very bad for the health to get wet," said he, philosophically. "Another time I advise you to bring a cloak like mine; it is very warm and not dear."

Having given this sensible advice, he withdrew his comfortable countenance within his snug garment, and relapsed into a luxurious doze.

It was long after nightfall when the diligence arrived at Kayserberg. Half dead with cold, Fortin scrambled down from the roof, and sought refuge in the inn kitchen, where a large fire blazed. On entering, he found a group of travelers already assembled round the cheerful hearth, and amongst them, to his surprise, were his cousin and the traveler whom he had deprived of his place. The cabriolet had taken them by a cross road, which was a short cut, and they had been an hour at the inn.

On remarking his cousin's deplorable plight, Mulzon at once gave up his chair to him; as for the traveler whom Fortin had dispossessed at Cernay, he could not restrain a hearty laugh.

"Upon my word!" he cried, "I must thank this gentleman for having driven me from the imperial of the diligence; for, had he not done so, I should now be wet and half frozen as he is, instead of being warm and comfortable as I am."

Fortin's position was altogether too bad to admit of a retort; he sat down before the fire, and tried to warm himself.

As soon as he was a little revived, he asked for a room and a bed; but the Kayserberg fair was only just over, and the inn was full of persons who were to leave next morning. Joseph and his companion, although they had arrived before the diligence, had found but one small bed vacant, which the former had generously given up to the latter. However, after much inquiry and investigation, it came out that there was another bed disengaged; but this stood in a room with four others, occupied by four pedlars, who refused to admit a stranger into the apartment.

"Did they engage the room for themselves alone?" inquired Fortin.

"By no means," replied the innkeeper.

"Then you have a right to dispose of the unoccupied bed?"

"Undoubtedly."

"Then what reason do they give for refusing to admit a fifth person into the room?"

"No reason at all; but they are four rough looking fellows, and nobody cared to have a quarrel with them."

Fortin rose quickly from his seat.

"That is weakness," cried he. "For my part, I certainly will not sleep upon a chair, because four strangers think proper to monopolize five beds. Show me their room. They must be made to hear reason."

"Have a care, Henry," said Mulzon.—"They are brutal, ill-conditioned fellows."

"Does their brutality entitle them to make us sit up all night?" sharply demanded the native of Marseilles. "No, *pardieu!* I will go to bed in spite of them."

He put on his traveling cap, and was leaving the room in company with the innkeeper, when Mr. Rosman, who, whilst seeking a man to carry his baggage, had overheard the conversation, approached the two cousins.

"I perceive, gentlemen," said he, with his friendly, smiling air, "that you have difficulty in finding beds for to-night."

"I shall not be long without one," replied Henry, passing on.

"One moment," said Mr. Rosman.—"These men will perhaps reply to your reasons with insult, and you may have difficulty in getting them to admit you are right. Had you not better accept beds at my house, gentlemen? I live but a few yards off, and shall have great pleasure in receiving you."

Fortin and Mulzen bowed and returned their thanks for this hospitable invitation—but in very different tones. That of Mulzen was grateful and joyous: that of his companion constrained, although polite. Henry had not yet forgotten that Mr. Rosman was the primary cause of the meagerness of his dinner at Cernay.

"You are too obliging, sir," said he softening his voice; "but I would not on any account occasion you so much trouble. It is well, besides, to give a lesson to these people, and to teach them to respect the rights of travelers."

Having thus spoken, he again bowed, and betook himself to the apartment occupied by the pedlars. Mulzen fearing a quarrel, followed him; but whether it was that the hawkers did not care much about the matter, or that they were daunted by the Provencal's resolute mien, they contented themselves with a little grumbling, in spite of which Henry installed himself in the fifth bed. His cousin, relieved of his apprehensions, then re-ascended the stairs and joined Mr. Rosman, who had been so obliging as to wait for him.

Miss Charlotte and her niece Louisa were preparing the tea before a crackling fire of fir-cones. Mulzen's guide spoke a few words in a low voice to the two ladies, who received the young man with courteous kindness. They made him sit down at the table, and Louisa filled the cups. As to Miss Charlotte, she had not yet recovered from the fatigue of her journey; seated in her arm chair, she fancied she still felt the jolts of the diligence, and heard the rattle of the wheels in the singing of the kittle. She did not forget, however, to inquire what had become of the young man who had carried the imperial of the diligence by assault at Cernay, and Mr. Rosman related what had occurred at the inn.

"Bless me!" cried Miss Charlotte, "he passes his life in search of quarrels and litigation! He is a man to be avoided like a pestilence."

"It is impossible to have a better heart or more upright character," replied Mulzen; "but he makes a point of acting up to his motto: *To every one his rights!*"

"Whereas your motto is *Charity,*" rejoined the old lady with a smile. "Oh! I overheard all that passed at Cernay."

"You travel together?" inquired Mr. Rosman.

"We are cousins," replied Mulzen, "and we have come to Kayserberg to be present at the opening of a will, which takes place to-morrow."

"A will!" repeated Miss Charlotte, in a tone of surprise.

"The will of our uncle, Dr. Harver."

The two ladies and Mr. Rosman looked at each other.

# Youth's Corner.

"Attempt the end, and never stand to doubt;
Nothing's so hard, but search will find it out."

For the Rural New-Yorker.

## ENIGMA FOR THE TIMES.

We are nine intimate friends, usually dwelling together, composed of 46 letters.

Our 27, 36, 17, 8 is a badge by which you may know our friends.
Our 2, 18, 34, 33, 10 we often create.
Our 5, 27, 42, 29, 11 is a tyrant, and his slaves generally 10, 16, 34, 11, 12, 40, 28, 7, 23, 3, 36.
Our 9, 22, 12 is our usual home.
Our 1, 27, 37, 22, 5, 13 is our *Captain,* and is often complimented for his good looks.
Our 20, 8, 41, 28, 11, 23, 6 is more common, and belongs to a lower order of spirits.
Our 8, 12, 36, 5, 3, 37, 8, 25 those that employ us often experience.
Our 5, 14, 30, 19, 11, 3, 2, 5, 28 forge their own chains.
Our 31, 18, 17, 8, 33 we cause our friends to do.
Our 46, 42, 17, 8, 28 we bring to many hearts.
Our 45, 30, 9, 22 is our common work.
Our 16, 26, 4 we often destroy.
Our 7, 39, 16, 23, 4 we often cause to suffer.
Our 46, 33, 3, 17, 43, 12, 2 our friends often do.
Our 16, 21, 28, 25, 2, 13 we bestow on our most intimate friends.
Our 35, 3, 2 is a degrading place.
Our 8, 19, 15, 31, 32 is a filthy thing.
Our 33, 39, 1, 36, 38, 41, 34 every youth should shun.
Our 37, 9, 43, 3, 14, 46 are rounds in the ladder of dissipation.
Our 20, 42, 19, 12 is a 16, 34, 37, 11, 12, 14.
Our 5, 12, 36, 33, 8 is the result of our efforts.

Each of us profess some skill in the healing art, but you must learn our names by the above characteristics.

G. A. H.

South Butler, N. Y.

**Albany Agricultural Works, Warehouse and Seed Store.**

*EMERY & COMPANY, Proprietors.*

SOLE manufacturers of the celebrated, Premium "Emery's Patent Changeable Railroad Horse Power," Threshing Machines and Separators, &c., &c., for one and two horses—designed for Farm, Plantation or Shop use. Its construction is such, that it can be applied to the driving of all kinds of machinery, without additional expense for gearing, &c., &c. It will be recollected this Power took the first prize at the great trial of implements, by the New York State Agricultural Society, at Geneva, in July last.

Owing to the great advance in the prices of Iron, we have found it necessary to advance the prices, to enable us to manufacture a power equally good with past seasons, rather than to use a cheaper material in their construction.

*Our prices will be for the season* 1853:

| | |
|---|---|
| "Emery's Patent Changeable Horse Power," Thresher, Separator, Bands, &c., for two horses, | $158 00 |
| Emery's Patent Changeable Horse Power, Thresher, Separator, Bands, &c., for one horse, | 125 00 |
| Common Rack and Pinion Power Thresher, Separator, &c., 2 horses, | 140 00 |
| Common Rack and Pinion Power Thresher, Separator, one horse, | 115 00 |
| Emery's Patent two-horse Power alone, | 116 00 |
| " " one-horse " | 83 00 |
| Common Rack and Pinion, two-horse, | 105 00 |
| " " " one horse, | 75 00 |
| Threshing Machine with Separator and fixtures, 26 inch cylinder, | 37 00 |
| 24 inch cylinder, | 35 00 |
| Sett of Bands for Machine, with extras, &c., | 5 00 |
| Fanning mills, fitted for Power, | $26, 28, 30, 32 00 |
| Portable Circular Saw Mills, with 24 inch circular saw, filed and set in running order, for wood cutting, &c., | 35 00 |
| Extra table and saw for slitting boards and fencing stuff, and general shop use, | 7 00 |
| Upright or Felloe Saw, for wheelright's use, | 40 00 |
| Cross Cut Saw, arrangements greatly improved to attach to Power for cutting logs into any desired lengths, in the yard or forest, | 20 00 |
| Churn attachments to Power, for one or more churns, | 12 00 |
| Feed Mills, with Iron plates, | 40 00 |
| French Burr Stone Mills, for farm or mill use, | $120 to 300 00 |
| Power Corn Sheller, | $10 to 55 00 |
| Clover Huller, from | $30 to 100 00 |

Thanking the public for their past liberal patronage, we pledge ourselves anew to them, to give them a good article at a fair price.

*Terms*—Cash or approved notes or acceptances, with interest, payable within four months in Albany, New York, Boston, Philadelphia or Baltimore, as may best suit the purchaser.

All articles warranted made of good material, and to operate as represented, or may be returned within three months, at the expense of the manufacturer for home transportation, and purchase money refunded. The purchaser being his own judge in each case. For further particulars, address the subscribers. Liberal deduction to dealers. Local agents wanted, to sell and put the above in operation, &c. Catalogues, giving full descriptions, furnished on application. EMERY & CO.,

173eow3t 369, 371 & 373 Broadway, Albany, N. Y.

**SPRING GRAIN AND SEEDS.**

WE have now on hand and for sale at the Genesee Seed Store, the following Field Grains:

| | | |
|---|---|---|
| 100 | bushels | Pure Fife Spring Wheat. |
| 100 | do. | Barley, 4 or 6 round. |
| 25 | do. | Do. superior new variety, 2 round. |
| 100 | do. | Buckwheat. |
| 100 | do. | Racine or Cat-tail Oats. |
| 200 | do. | Reapt Timothy seed. |
| 400 | do. | Common do. |
| 25 | do. | Large Clover. |
| 25 | do. | Red Top. |
| 20 | do. | Orchard Grass. |
| 50 | do. | Millet. |

172-tf. J. RAPALJE & CO.

**GARDEN AND FIELD SEEDS**

*From the New Establishment of Van Zandt & Bowdish,*

No. 114 State street, Rochester, N. Y.

CAN be purchased of the merchants generally throughout the country, in Papers or Packages, on the most reasonable terms. Also at the Agricultural Warehouse of E. D. Hallock, No. 24 Exchange street, near the Clinton Hotel, Rochester, N. Y.

The Seeds from this establishment can be relied on as being of the very best quality. They are mostly imported, or grown by the Eastern Shakers, and are warranted.—Full directions for cultivation printed on each Paper and Package. VAN ZANDT & BOWDISH.

Rochester, N. Y., 1853. 170m6.

**Pure Bred Male Stock at Private Sale,**

AT MOUNT FORDHAM, WESTCHESTER CO.,

Eleven Miles from City Hall, New York.

I WILL sell and let from 10 to 12 Short Horned Bulls and Bull Calves, 4 Devon Bulls and Bull Calves, and from 12 to 15 Southdown Rams. The annual sale by Auction will be omitted this year, as I wish to reserve all the Females, having recently purchased another Farm, to enable me to increase my Breeding Establishment. My Hog Stock, including all the Spring litters, are engaged.

Catalogues with full Description and Pedigrees of the above Bulls, and Southdown Rams, with the Prices attached, can be obtained by the 15th April next, from the subscriber, or at any of the principal Agricultural Stores, or from the Editors of the principal Agricultural Journals.

March 23d, 1853. 170m3 L. G. MORRIS.

**MOORE'S RURAL NEW-YORKER:**

A WEEKLY HOME JOURNAL,

**For both Country and Town Residents.**

PUBLICATION OFFICE,

Burns' Block, corner State and Buffalo Sts., Rochester, N. Y.

**TERMS, IN ADVANCE:**

Two Dollars a Year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

**Terms of Advertising**

One Dollar per square (ten lines—100 words, or less,) for each insertion,—*in advance.* ☞ The circulation of the New-Yorker is much larger than that of any other newspaper published in the State, out of New York city. Only a limited space, however, is devoted to advertisements, and hence preference is given to those most appropriate—such as the cards and notices of dealers in Agricultural Implements and Machinery,—Horticulturists and Seedsmen,—Booksellers and Publishers,—Inventors, etc. All orders by mail should be accompanied with the cash.

To enable us to accommodate as many as possible, brief advertisements are preferred. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

**THE WOOL GROWER AND STOCK REGISTER.**

This is the only American Journal primarily devoted to the interest of Wool and Stock Growers, and should be in the hands of *every owner of Domestic Animals.* It is ably conducted, published in the best style, and finely illustrated. Each number contains a careful Review of the Wool and Cattle Markets, and much other *useful* and *reliable* information which can be obtained from no other source. The Fourth Volume commenced in July last.

Terms:—Fifty Cents a Year; Five Copies for $2; Eight for $3; Eleven for $4. Back volumes, bound in paper, at 40 cts. each,—unbound at 35 cts., or three for $1.

Published monthly, in octavo form. Specimen numbers sent free. Money, properly enclosed, at our risk.

Address D. D. T. MOORE, Rochester, N. Y.

### Progress and Improvement.

### SAVING AND APPLYING MANURE.

NONE of our Agricultural readers should fail to peruse an article under this heading on the first page of last week's RURAL, for it is one full of excellent suggestions, and worthy of their careful consideration. That the course recommended is a successful and profitable one, they can be assured by re-reading a communication entitled, "Farming a Paying Business," in the 8th No. of the present volume, in which the result of the writer's practice is shown to be a good living and *thirteen per cent. profit* on the capital invested in his farming operations. Such, always, are the returns of well-considered and thoroughly-applied plans for the *feeding* as well as the cropping of the soil, and such always will be their character.

It is important, too, as calling the attention to procuring, as far as possible, the necessary supplies of manure upon the farm. While so many of the home-sources are neglected, and so many valuable fertilizers remain unemployed—although within the reach of every farmer—any thing which will awaken them to this subject is of value, and should be given place and prominence in our Agricultural journals. To turn, as far as possible, every resource to economical account, is one secret of success in this, as in every other business. It should indeed, be "a prominent part in the farm-work, to manufacture as much manure thereon as possible." It should be a subject of careful study, to so apply the manurial resources, and so vary the course of cropping, as to give every field its due share—that thus the whole farm may become alike fertile and productive, and the whole pay a fair profit to the owner for his outlay of capital and labor—of thought and attention.

That farming, as it is too often practiced, does not pay as it once did, is a conceded fact. But there are very good reasons for this fact, and they were well stated by our correspondent. Land *can be worn out*—and unless some means are used to restore again what is continually taken from it by cropping, it will wear out. And the cultivation of land exhausted by long tillage—its cultivation on the same system which has exhausted it—is truly a hard, unprofitable and unpleasant business—enough to give "the blues," even to the most shiftless and unenergetic of those who plod along in its practice. The best thing they can do is to "move west," or better, to quit farming altogether,—for assuredly such farming will never pay, either in pleasure or profit.

But Nature is ever provident of resources. Farming may be made profitable even upon soils such as these. There seems to us no greater triumph of science and skill than to take a sterile, unproductive farm, and by the application of simple means—means, perhaps, furnished in abundance within its own bounds—to restore it to fertility and productiveness, such as shall make it truly profitable, and its cultivation an easy and pleasant task.

SAVING AND APPLYING MANURE, combined with thorough cultivation and a judicious system of rotation of crops, is the true way of producing and keeping up fertility in the soil. Shall it not be thought of, studied, and attended to, by those so closely interested in the subject—those whose welfare and position depend so essentially upon the success with which it is accomplished?—But we need scarcely ask this question. It is evident on every hand, that it is attracting thought and study, and becoming a great practical fact in every farmer's plans and operations. And it is one of the leading designs of the agricultural department of the RURAL to "push on the column."—to furnish in every issue some fact or suggestion which shall aid in the good work. Give us the material, ye men of progress,—give us your experiments and experience in farming, and the lessons which they teach shall be made available to thousands, and thus help on the glorious march of Improvement.

### HOW SHALL MANURE BE APPLIED TO THE SOIL?

IT is now pretty generally conceded that manures may be wasted both by leaching and evaporation, and hence "surface manuring" and "plowing in," are both in part right, and in part wrong. The advocates of the two systems have long discussed their several advantages, bringing forward various reasons in support of their favorite systems, and inducing the conclusion—at least on the part of the unprejudiced observer—that the best mode of applying manures was, "to keep them near the surface, well mixed with earth, as in that situation they were most readily brought into a soluble condition, and rendered available to the support of plants—their valuable qualities being neither liable to be dissipated by the atmosphere, or washed too deeply into the soil." These conclusions are induced by the following considerations:

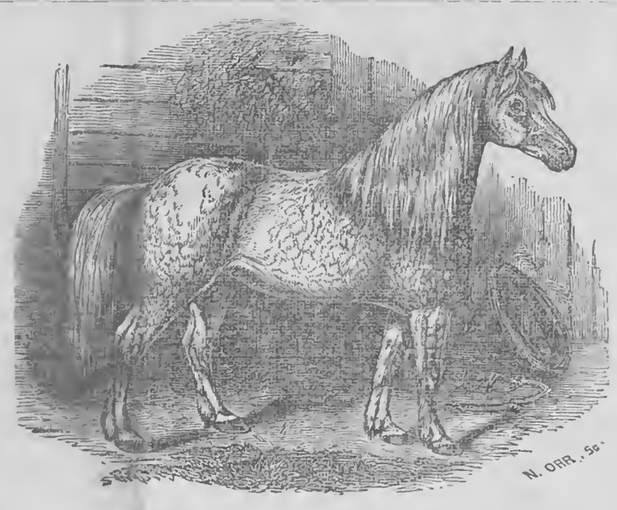
1. That manure is lost by going downward—by its sinking into the soil beyond the reach of plants—is proved by experiment and observation. Most farmers have observed this in their barn-yards and beneath manure heaps. The soil after a time becomes perfectly saturated with the manurial elements for a depth of several feet,—and such soil may be employed as a fertilizer with nearly equal results with the manure itself. This shows that it will "leach." And

2. That it is lost by evaporation is equally evident. Its chief value resides in certain gases—some of them of a highly volatile nature. The nitrogen exists chiefly in the form of ammonia, and that this will escape is readily perceived by the smell when any body of manure is undergoing decomposition. The "surface manuring" which pastures receive from cattle and horses, is of little value compared with what it would be were there no loss by evaporation. The liquid droppings which are immediately absorbed, alone produce any marked effect. Hence

3. The true point to be observed in the application of manures seems to be, to "place them where none of their value shall be wasted, and at the same time in a situation to be acted upon by the agents of decomposition." Heat, air, and moisture are the chief agents in this process. Without heat there can be no action or change, or without air and its great decomposing element, oxygen; and moisture is required to aid in the permeation of heat and air. Light also is useful, and in some degree necessary. The same influences essential to the germination of seeds, are necessary to the decomposition and action of manure. Both will remain inert if buried too deeply, both require to be brought within the influence of heat, air and moisture.

Manures applied as ameliorators—with a view to their mechanical action upon the soil—are excepted from these rules. To render a heavy soil more friable by the use of muck or other partially decomposed vegetable matter, it should be deeply plowed in, that in subsequent cultivation it may be thoroughly mixed with the soil. So too of the application of clayey composts to light sandy soils.

—But no special rule can apply in all cases. The farmer must carefully consider the state of his manures, of his soils, his means to work with, and the result he would arrive at. Coarse or long manure, all agree, should be given greater depth than that composted and well decomposed, and it is a conceded fact, also, that the latter is more immediate and active in its effects.



NORMAN HORSE, "LOUIS PHILIPPE."

THE above portrait from "Randall's Youatt on the Horse," is a good representation of the Norman Horse "Louis Phillippe," owned by R. B. HOWLAND, of Union Springs, Cayuga Co., N. Y. He was bred by Edward Harris, Esq., of Moorestown, N. J., (in 1843,) from his pure imported Norman Stock. "Louis Phillippe" is an excellent characteristic specimen of the Norman Horse; is a dapple gray, fifteen hands one and one-half inches high, and weighs twelve hundred pounds, when in good condition.

His sire was exhibited, when four years old, at the Fair of the N. Y., State Agricultural Society, in Albany, in 1842, and won high commendation from the committee. They report this horse, "one of unusual substance and symmetry for the breed, the whole conformation betraying immense strength. He also displayed free and spirited action. The committee believe, that in its pure state, this variety of horses would prove most valuable for heavy draught; and there is little doubt that if crossed with the light mares of our country, would produce a peculiarly hardy and active race of horses, fit for the road or plow."

### MR. REDPATH ON DRAINING.

HOW DEEP DO THE ROOTS OF WHEAT EXTEND?

MR. EDITOR:—I believe it was that eminent chemist, Sir HUMPHREY DAVY, who said that "nothing is so instructive in experimental science as the correction of mistakes." If he is correct in regard to experimental *science*, is it not very important to "correct mistakes" in *experimental practice?* For my own part, I think it more important in the *latter* case than in the *former*; for if a mistake occurs in *science*, (theory,) it calls for no positive action, and may not do much harm; whereas a mistake in practice oftentimes involves a man in irretrievable ruin.

I was led into this train of thought by observing in your 158th number, the first part of an "*Essay on Draining*" by Mr. REDPATH, in which he says that shallow drains are liable to be clogged by "the *roots of wheat*, which will frequently strike down *six or seven feet* below the surface," &c.—It is possible that there is a "*slip of the pen*," or a typographical error, in this matter.—If neither, I must confess to much astonishment in regard to it. How it may be in Mr. Rs.' native country, I do not know, but in the country where I reside, I will venture to say that no *forest tree*, even of a hundred years growth, ever "struck its roots down below the surface six or seven feet," or much, (if any) more than half that depth.

I am aware that there is a very general opinion prevalent in our country, in which I concur, that, usually, the roots of a tree, or plant, are about as long as the stem and branch. But those *long roots* do not "*strike down* 6 or 7 feet below the surface;" they run ramblingly off, *near the surface*, in search of their proper nourishment. I believe it is generally understood that in the ordinary soils of the Genesee country, neither root nor seed, ever did, or would grow, if buried to the depth of 6 or 7 feet below the surface; because of the lack of those indispensable requisites, *air and heat*—without which nothing vegetable, can *grow, or live*—even the roots of the Canada thistle (a plant most tenacious of life,) has been destroyed, in a single season, by *monthly* cutting just below the surface of the ground.

The facts I have mentioned seem to afford sufficient proofs that the roots of the more tender wheat plants could not grow, at such a depth, even if the strength of the plant enabled them to "strike down" as far as Mr. R. asserts. Indeed, it must be utterly impossible that a weak plant, having a "natural" life time of only 10 or 11 months, could strike down its roots more than a *fourth*, and most probably not more than a *sixth or seventh* part of six or seven feet. There are several other matters in the "Essay," upon which I should like to have information; but, as I observe that that good *practical farmer*, LINUS CONE, has noticed them, it is unnecessary for me to mention them. A long experience had long since led me to the same conclusions with Mr. CONE, in regard to deep plowing and cultivation. I will only remark further, that I should not have troubled you, or Mr. R., in regard to this matter, but that I feared the young and inexperienced might be led into a mistake by Mr. Rs.' error, and I did not know of any more efficacious mode of conveying instruction than by the "correction of the mistake." 'HIEL.

### CONDENSED CORRESPONDENCE.

#### The Cultivation of Carrots.

MR. MOORE:—I have seen in your pages recently, several communications upon raising carrots; but do not think the subject is yet exhausted. I have seen as yet no plan for digging or sowing them, which I prefer to mine. I have for a few years past practiced digging with the plow, and I think it saves at least two-thirds of the labor. The rows should be sown straight as possible, and when ready to dig commence on one side of the piece—plow one furrow about a foot from the first row, turning the dirt from the carrots—then commence again at the first place of setting in, and plow the next furrow deep, the same way, with the landside of the plow as near the carrots as possible, this leaves them all exposed, and they can be taken out by hand very easily. The tops may be cut with a hoe, before digging, but I generally leave the tops on until after they are dug.

My method of sowing is this:—Turn under a good coat of manure, deep, and use the sub-soil plow at the same time; drag the land smooth,—then strike straight furrows through the piece from eighteen inches to two feet apart, and drop manure in these furrows; cover the manure by turning a furrow each way with a light plow. The ridges thus made will be the same distance apart as the furrows first drawn. Rake off the top of these ridges with an iron toothed rake, which leaves them free from stones and other impediments to the use of the drill. The drill which I used last season, and which I prefer to any other I have used, was got up by E. D. HALLOCK, of your city.

I make the rows that distance apart to admit of a light plow and horse in cultivation. At the last hoeing I scatter turnip seed in the middle of the space between the rows, to fill up the ground. If the hand hoe or hand cultivator is used, the rows might be nearer together, say sixteen inches. I consider carrots a valuable crop to raise, either for feeding or to sell. My store hogs have done well on them this winter. Indeed there is scarcely any animal which will not eat and thrive on them.—WILLIAM HODGES, *Brighton, N. Y.*, May, 1853.

#### How Farmers may use Chemistry.

MESSRS. EDITORS:—In No. 13 of the present volume, is an article on Agricultural Chemistry, in which it is well said, that "it would seem to any thinking, reflecting mind, that the science and art which treats of, and explains the laws of growth and nourishment, whether of plants or animals, would be of the deepest interest to all who are engaged in Agricultural pursuits." If this be the case—if chemistry, can be of so much benefit to the farmer, (and I firmly believe it can)—it is for his interest that it be bro't into use as soon as possible. A few scientific farmers receive some benefit from it now, and it should be spread throughout the country, that every farmer might do the same. Then we might behold a rapid improvement in the quality, and an increase in the amount of grain, roots, &c.

The first question that arises, is: How can the science of chemistry be made available? or, how can every farmer receive the benefits arising from it? We have as yet, no agricultural [illegible] where he might gain a thorough practical knowledge of chemistry. And if we were blessed with these institutions of learning there are but few of the great mass of farmers who could improve the chance. The late Prof. JOHN P. NORTON, in his address before the New York State Agricultural Society, in 1851, said—"Do not encourage your young farmers to indulge in the idea of becoming chemists, or thoroughly scientific men. There is much in the way of science that they may most profitably study and practice upon, but they cannot usefully or advantageously go beyond the more elementary departments; he who cherishes the desire to do more than this, must make chemistry his chief pursuit for a long period of time, and under good advantages for instruction."—As Prof. NORTON has said, there is much in the elementary department upon which the farmer may study and practice, but he can not gain a knowledge of chemistry that will enable him to analyze soils, &c., readily.

On the 126th page, of the present volume of the RURAL, is a fine classification of manures, which every farmer reader ought to preserve, and with this classification he should have an analysis of the different kinds of grains and roots. Then, knowing what crops have been taken from the soil, and what he wishes to take from it next, he can turn to his analysis of grains, and classification of manures, and soon determine what to apply to restore the fertility of the soil, and bring forth a good crop. But, I think the farmers may receive more benefit from chemistry than this. Why is it that every man is not his own physician? Because he has not the time or means, and even if he had it would be cheaper to pay a person who has made it a study for years. If this be the case in medicine, why not in agricultural chemistry? Why not have practical chemists, on whom the farmers may call, to have their soils, grains, manures, &c., analyzed. This is the most feasible plan that I see, to introduce agricultural chemistry to the farming community.—E. A. B., *Medina, N. Y.*, April 29, 1853.

#### Care of Harness—Again.

TO THE EDITOR:—I wrote for the "*Zanesville Aurora*," an article which was copied into your paper, on the "Preservation of Harness," to which your correspondent "H.," replies April 30th, objecting to the method

in part. Had the article done no other good than to wake up the old farmer to think and write for the agricultural press, I should feel satisfied, and cannot but hope, that now he has commenced he will give your readers more of his experience.

His objection is *well founded*, but on a *mistaken idea of the process.* To boil leather is to measurably destroy its elasticity; but to fill up a tub or barrel with stiff old harness and pour on water, which was boiling when it left the fire, certainly does not do any harm, as my experience proves.—The leather, the atmosphere and the vessel quickly reduce it many degrees below the boiling point in the shortest possible space of time, and this change continues until all acquire the temperature of the air around. There is a coat of gummy matter, formed of grease, dirt sweat, &c., which cold or cooled water will not dissolve in a week.

I keep several vehicles and harness adapted to each, my profession being a Physician, and I assure your corrospondent "H.," that I have the softest and most pliable harness in our county, for I can tie of one the traces round my finger so as to cause pain, which cannot be done when they are new.

I have never discovered any damage my harness has sustained, and once a year I treat them just as the article from the *Aurora* describes. I hardly ever have any thing break; dont think the repairs on three single sets of harness for three years passed, have cost a dollar, and every strap is sound now.

Our tanners here use copperas water to black harness leather, which I consider worse than vinegar and iron; for the acid in the coppreas (oil vitriol) is caustic in the extreme; while vinegar (ascetic acid) is very feebly so.

I like the idea of the *Cordovan* leather, and hope to hear more about it.

I repeat, that soap suds or water, near the boiling point, has not injured *my harness*, and that the oil will not penetrate through and through the leather, unless exposed to the sun or fire heat; and can recommend others to do as I have done, with theutmost confidence that they will not be disappointed in the results. If "H." will try, I will stand good for all damage.—*Z. C. McElroy, Zanesville Ohio*, May 6th, 1853.

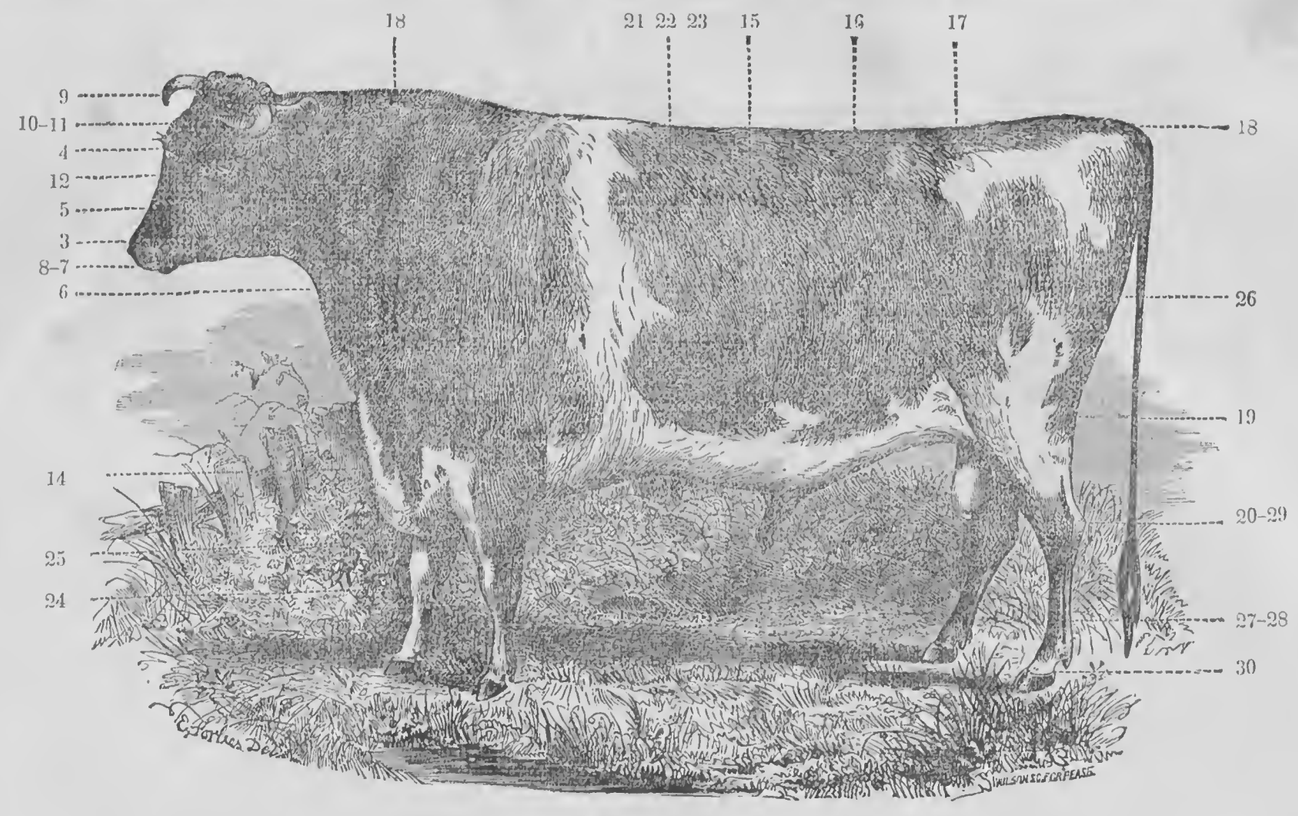
### FOWLS &c.

Mr. Moore.—*Dear Sir:*—to-day I read an article in your valuable *Paper* on *Cochin china* and *Brahma Pootras* published the 9 of April signed *Hong Kong* and an other the 23d of April Signed *Shanghae.* The two *Articles* wre undoubtedly written by the same person—who by the by is in my opinion more of a *Printer* or *Ed.* thau a practical breeder of choice and fancy *Fowls.* But to the law and tostimony. In the first place the writer labours to Show the folly of paying the present *High* prices for the *Brahma Pootra* fowl & would honestly give a warning voice to the *Public*—very kind indead if he had gone no father—But in his very next breath He speaks in his peculiar manner of the deap rich *Buff Gold* color of the *cochin china* fowl & in perticular of those owned by Mr. Decker—which to the knowing ones is the key to both of these remarkable articles.—why are Mr. D.s fowls spoken of instead of others who have the same Stock and those too who had the choice of that breed before Mr. D.—It might be well to say that there has been a good deal published about Mr. D.s *cochin china* fowls the past winter and spring in the *city Papers* for some reason or other.—Again why does the writer close his honest document by telling us of the wonderful good qualities of the *cochin china's* & the extraordinary *High Prices* paid in *England* for them—while at the same time he would kindly advise buyers not to pay to *High* prices for other & to my mind fair superior breeds. The writer of this article is well acquainted with Mr. D.s breed of *cochin china* fowls having purchased a *Pair* of the same *Person* that Mr. D. did & that to of the same brood—Now I happin to know something of this remarkable breed of fowls—I would say that I never new a better breed of *cochin china* fowls & yet they do not breed true (not nigh so much as so as the *White* & *Black Shanghae.*) Mr. Vick who bought this stock of *G. P. Burnham*—from his old *Pair* raised chickens which had yellow legs and those that had dark green ones & also those that were heavily feathered on their legs while others had none whatever—Some were a light *Buff* color while others were dark with black spots on them. Mr. Decker's and so do all others who have the same stock—breed in the same manner & what I State is known at least in this *city* to be true & by all who have bred this stock of *cochin chinas* — they are a good fowl but they have been bred in and in so long that they have some what degenerated & are not so *Healthy* and vigorous as at first. I would remark that it would be well to obtain some other importation to cross with them—I have bred the same stock last year & my chickens were more tender and difficult to rear than any other breed I had.—Fowls should not be bred in and in if you wish to prosper with them. It is not my object to speak in high terms of any particular breed of fowls for I have no interest to do so as I have all the late varieties now on hand and shall breed this season over twenty different kinds—I would here say that I consider that all the china fowls are of the same *Family* and the habits and qualities in the main are very much alike—from what I have seen I must say they are of all colors. I consider the *Black, Buff* and *cochin china* fowls to be of the same value (which at present is $5, a pair) I must give the preference to the *White Shanghae* for this reason they are equally as hardy and as easy to rear and they lay a larger egg than the other colors and commence laying at least two months earlier then the *Black, Buff*, or *cochin china*—which is certainly something in their favour (they are worth $10, a pair)—I now came to the *Brahma Pootra's* I believe it is conceded that they are the largest fowls we have they were brought to this country in the fall of 1849 and the original Hen was grey and the crower was lighter colored having a white body or nearly so tinged with yellow with speckled neck hackles and dark wings & tail which are vary beautiful in the extream surpassing all other fowls I have yet seen in color & beauty—they have fine large compact bodies with short legs for their extreme size and in ever *Particular* both as regards form and color the most beautiful of any of the *Oriental* breed of fowls I have yet seen—They will lay at least as many eggs as any other kind and 9 of their eggs will weigh on an average as much as 13 of *Mr. Hong Kong* or *Shanghae's cochin chinas* & they are certainly more easily reared—they are more quiet than any other race of fowls we have & from what I have seen of them all things considered I must with the most of those if not all who have bred them say that I know not a better or so good a fowl besides as the pure bred *Brahma Pootra.* They are worth $25, a pair. *Brahma.*

We give the above by request of the writer. Fearing, perhaps, that we might lessen its force or beauty of expression, he desired us to publish it as written, without change; hence we are in no way responsible for its style, &c.

Neither of the articles to which Brahma alludes were written by either a printer or editor,—nor by Mr. Decker, or (so far as we are aware,) within his knowledge. To substantiate the general correctness of those articles, however, we give the following extract from a private letter recently received from an intelligent New England friend and correspondent. It will be seen that the writer is well posted on the subject of fowls. He says:—[Ed.

Your correspondent takes too much pains in proving the Brahama Pootras a "humbug." There is nothing to justify the pretension that is set up for them, in any shape. I saw just such fowls more than thirty years ago, brought from India under the name of the "Malay or Chittagong" breed. I have seen just such in Pennsylvania, bred from stock which reliable men said was brought from India fifty years ago. John Lossing, of Albany, has had just such ones for twenty-five years. Dr. Bennett asserts that his came from "the valley of the Brahma Pootra river." How does he know? He described and *figured* them first as having *top-knots.* (See Report of Exhibition of the Poultry Society at Boston, 1851.) According to Mr. Cornish, of Hartford, they were brought to New York by a vessel from Calcutta, and he did not pretend to give their history any further. These are not the top knots—Dr. B. found they wouldn't go, and abandoned them. Part of the fowls sold here as Brahma Pootras, Grey Shanghais, &c., came from stock brought from Canton, and part from stock from Shanghai. As to any purity of blood being denoted by color, &c., a man offered to show a pair of whites, a pair of blacks, and a pair of greys, all bred in one year from the *same stock* as Dr. Bennett's Brahma Pootras. One would suppose that only young gulls could be caught in such flimsy traps as these "hen" speculators set.



JERSEY BULL—PERFECTION 33 POINTS, ILLUSTRATED.

The portrait of a Jersey bull, given above, not only represents a fair specimen of the breed, but illustrates the "points" adopted by the Royal Jersey Agricultural Society, and continued after an experience of ten years without alteration. Of the Jersey breed of cattle we shall speak in a future number: our main object, at present, is to show the points by which the bulls are judged.—By reference to the corresponding figures above, the reader will readily understand the following *Scale of Points for Bulls:*

| Article. | Points. |
|---|---|
| 1. Pedigree on male side | 1 |
| 2. Pedigree on female side | 1 |
| 3. Head, fine and tapering | 1 |
| 4. Forehead broad, | 1 |
| 5. Cheek, small | 1 |
| 6. Throat, clean | 1 |
| 7. Muzzle, fine and encircled with a light color | 1 |
| 8. Nostrils, high and open | 1 |
| 9. Horns, smooth, crimpled, not too thick at the base, and tapering, tipped with black | 1 |
| 10. Ears small and thin | 1 |
| 11. Ears, of a deep orange color within | 1 |
| 12. Eye, full and lively | 1 |
| 13. Neck, arched, powerful, but not too coarse and heavy | 1 |
| 14. Chest broad and deep | 1 |
| 15. Barrel hooped, broad and deep | 1 |
| 16. Well ribbed home, having but little space between the last rib and the hip | 1 |
| 17. Back, straight from the withers to the top of the hip | 1 |
| 18. Back, straight, from the top of the hips to the setting on of the tail; and the tail at right angles with the back | 1 |
| 19. Tail, fine | 1 |
| 20. Tail hanging down to the hocks | 1 |
| 21. Hide, thin and movable, but not too loose | 1 |
| 22. Hide covered with fine and soft hair | 1 |
| 23. Hide of a good color | 1 |
| 24. Fore-legs, short, straight and fine | 1 |
| 25. Fore-arm, large and powerful, swelling and full above the knee and fine below it | 1 |
| 26. Hind-quarters, from the hock to the point of the rump, long and well filled up | 1 |
| 27. Hind-legs, short and straight (below the hocks) and bones rather fine | 1 |
| 28. Hind-legs, squarely placed not too close together, when viewed from behind | 1 |
| 29. Hind-legs, not to cross in walking | 1 |

## AGRICULTURAL INTELLIGENCE.

### N. Y. State Agricultural College.

The bill incorporating the New York State Agricultural College, as we have before noticed, passed both branches of the Legislature, and will, we learn, as soon as practicable, go into operation. The trustees are:

John Delafield, of Seneca; Henry Wager, of Oneida; Wm. Kelly, of Duchess; A. King, of Queens; N. B. Kidder, of Ontario; Joel W. Bacon, of Seneca; Wm. Buel, of Monroe; Tallmadge Delafield, and Robt. J. Swan, of Geneva; and such others as may be associated with them.

These gentlemen are generally well and favorably known, to the farming community as ardent and able advocates of Agricultural Improvement, and will doubtless secure a competent board of instruction and mature a plan whereby to carry out a system of thorough, practical and scientific Agricultural Education. A farm and grounds of not less than three hundred acres, are first to be secured.

### Hawaiian Agriculture.

The Transactions of the Hawaiian Agricultural Society for the last three years, (annual productions of decided merit, from its President, the Hon. William Lee, a native of this State,) furnish much valuable information relating to the agricultural productions and capabilities of this group of islands. Cane culture, the manufacture of sugar, and stock-growing, are the leading branches of rural industry. A lack of laborers to cultivate the soil—the natives being averse to steady work—is the main inconvenience which farmers and gardeners have to encounter. So large is the number of vessels which call there for supplies, and so remunerating the prices paid at San Francisco, that both agriculture and horticulture are exceedingly profitable. So says the Daily American.

## THE AGRICULTURAL PRESS.

### Requisites of a Good Soil.

The following article on tempering the soil, so as to give it the required character for productiveness, is copied from the *New England Farmer:*

The character of the soil, by which we mean its capacity to afford a habitation to the plant appropriate to it, and at the same time to furnish the required aliment, is a matter, as all farmers must see, of the first importance. What are the requisites to a soil of this character? and how shall they be supplied, when wanting?

The soil should be such as to afford sufficient moisture to the roots and to admit the air to penetrate it freely. The soil consists of decayed vegetable matter, sometimes mixed with particles of rock reduced to fine pieces by the action of the atmosphere and of water, and sometimes, by the roots of plants. It is unnecessary to describe the different kinds of soils in regard to adaptation to this object of supplying moisture; second, it should afford a supply of carbonic acid. This is furnished by the decay of vegetable matter, or by absorption from the atmosphere. This faculty of absorption is assisted by mixing charcoal, gypsum, or other matters having a great absorbing power. Charcoal has a great power of absorbing this substance, and it has been found that plants will grow more luxuriantly in this than in any other soil, if well supplied with water. The benefit of the charcoal or gypsum is only as a medium of absorption; the fertilization is derived from the water, which is converted by the plant itself, in its vegetable laboratory, into carbonic acid.—Third, the soil should be capable of furnishing a supply of ammonia to the roots. This also is much assisted by gypsum and charcoal, which absorb it from the atmosphere. The usual mode is by addition of anima matter from the stable. Nitrogen imparts ammonia to the plant, and it is to this last that the nutritive power of the cereal grains and esculent vegetables is owing.

Fourth, it should contain those mineral ingredients which are necessary to the growth of plants. These, if wanting, must be supplied. The usual mode of doing this is by the mixture of other soils. This is also advantageously resorted to when the soil is too little or too much retentive of moisture in consequence of being too loose or sandy or calcareous, or too compact and stiff. This is called tempering the soil.—When a soil is too loose and porous, or too stiff, the mixture of the opposite kind in just proportions will bring it to a more suitable condition. In this way a body is given to those lands that are deficient of it, and those which are too heavy and tenacious are made more light and loose. This process brings no nutriment to the plant directly, but only mediately by attaining a retentive power in the right degree, and thus furnishing nutriment by a proper supply of water; and it also acts favorably on the health and quality of applying water to plants, for the reason that in running over the ground it takes up and holds in solution the mineral matters required.

### Points of Cattle.

A scale of the Points of Excellence in Cattle for four different Breeds—the Short horns, Devons, Herefords and Ayrshires—has been prepared for the New York State Ag. Society, by Francis Rotch, Esq., one of the most systematic and skillful breeders in the country. It has long been needed to settle the indefiniteness and confusion which judging by different standards has induced. We copy first, two valuable explanatory paragraphs, by Mr. R., and follow them with the points of the Short-horns and Devons. Those of the Hereford and Ayrshires will be given hereafter:

"As to the points *constituting excellence,* little perhaps need be said, beyond the remark, that reference has been had to the particular uses and characteristics of the respective variety under consideration. For instance, the heavy, massive form of the beef-making, indolent Short-horn, would be, in many of its details, inapplicable to the activity of the North Devon, whose great excellence as a laborer on a light soil, must be one of its leading considerations in the estimate of its usefulness. So again of the Hereford, whose double value in the yoke and in the shambles, requires a balance of properties, that is not called for in the animal whose only destination is the butcher's block. The Ayrshire is a breed whose improvement has had reference solely to dairy properties; it would be destructive, therefore, of that very improvement, to require in this, either the substance or symmetry of the other breeds.

"Another consideration has also influenced the numerical value affixed to the *same* points in *different* breeds; which is, that where from a natural or original tendency, there is a deficiency or a difficulty in bringing any one or more points up to a maximum, they are marked higher in *that breed,* than in one known to be naturally strong in that particular: for instance, it is more difficult from the general conformation of the animal, the heavy shoulder, and the massiveness throughout, required in the Short-horn, to breed the crops full up and even, than it is to do so in a North Devon; hence that point well developed in the Short-horn is marked 4, in the North Devon only 3. So in the Ayrshire whose great excellence is her dairy properties, the udder is marked 6, while in the other varieties of *improved* breeds it is marked low, inasmuch as their improvement has had reference *solely* to early maturity, weight, symmetry, reduced offal, quality, and the best feeding properties, yielding the greatest amount of meat at the smallest expense."

SHORT HORNS.—THE COW.

*Pedigree*—showing unbroken descent, on both sides, from known animals, as found in the English Herd-Book—40.

*The Head*—small, lean and bony, tapering to the muzzle; the face somewhat long—2.

*The Nose*—of a light delicate color—1.

*The Eye*—is of great significance, and should be prominent, bright and clear—"prominent" from an accumulation of "adeps" in the back part of its socket, which indicates a tendency to lay on fat—"bright," as an evidence of a good disposition—"clear," as a guarantee of the animal's health; whereas a dull, sluggish eye belongs to a slow feeder, and a wild, restless eye, betrays an unquiet, fitful temper—2.

*The Horns*—light in substance and in color, and symmetrically set on the head; the ear somewhat large, thin, and with considerable action—1.

*The Neck*—rather short than long, tapering to the head; clean in the throat, and full at its base, thus covering and filling out the points of the shoulders—2.

*The Chest*—broad from point to point of the shoulders; deep from the anterior dorsal-vertebra to the floor of the sternum, and both round and full just back of the elbows: sometimes designated by the phrase, "thick through the heart."—These are unquestionably the most important points in every animal, as constitution must depend on their perfect development, and the ample room thus afforded for the free action of the heart and lungs—8.

*The Brisket*—however deep or projecting, must not be confounded with *capacity* of chest; for though a very attractive and selling point, it, in reality, adds nothing to the space within, however it may increase the girth without. It is in fact nothing more nor less than a muscular adipose substance, attached to the anterior portion of the sternum, or breast-bone, and thence extending itself back. This form, however, of the brisket, indicates a disposition to lay on fat generally throughout the frame, and in this point of view is valuable—4.

*The Shoulder,* where weight, as in the Short-horn, is the object, should be somewhat upright and of good width at the points, with the blade-bone just sufficiently curved to blend its upper portion smoothly with the crops—3.

*The Crops* must be full and level with the shoulders and back; and is, perhaps one of the most difficult points to breed right in the Short-horn—4.

*The Back, Loins and Hips* should be broad and wide, forming a straight and even line from the neck to the setting on of the tail, the hips or hucks round and well covered—6.

*The Rumps* laid up high, with plenty of flesh on their extremities—3.

*The Pelvis* should be large, indicated by the width of hips (as already mentioned) and the breadth of the twist—2.

*The Twist,* should be so well filled out in its "seam" as to form nearly an even and wide plane between the thighs—1.

*The Quarters*—long, straight and well developed downwards—3.

*The Carcass*—round; the ribs nearly circular, and extending well back—4.

*The Flanks*—deep, wide, and full in proportion to condition—4.

*The Leg*—short, straight, and standing square with the body—2.

*The Plates* of the belly strong, and thus preserving nearly a straight under line—1.

*The Tail*—flat and broad at its root, but fine in its cord, and placed *high up,* and on a level with rumps—2.

*The Carriage* of an animal gives style and beauty; the walk should be square and the step quick; the head up—1.

*Quality.*—On this the thriftiness, the feeding properties, and the value of the animal depends; and upon the touch of this quality rests, in a good measure, the grazier's and the butcher's judgment. If the "touch" be good, some deficiency of form may be excused; but if it be hard and stiff, nothing can compensate for so unpromising a feature. In raising the skin from the body between the thumb and finger, it should have a soft, flexible and substantial feel, and when beneath the out-

spread hand, it should move easily with it, and under it, as though resting on a soft, elastic, cellular substance; which, however, becomes firmer as the animal "ripens." A thin, papery skin is objectionable, more especially in a cold climate—8.

*The Hair* should be thick, short and mossy in winter; fine, soft and glossy in summer—1.

*The Udder*—pliable and thin in its texture, reaching well forward, roomy behind, and the teats standing wide apart, and of convenient size—1.

### POINTS OF THE SHORT-HORN BULL.

As regards the male animal, I have only to remark, that the points desirable in the female are generally so in the male, but must, of course, be attended by that masculine character which is inseparable from a strong, vigorous constitution. Even a certain degree of coarseness is admissible, but then it must be so exclusively of a masculine description as never to be discovered in the females of his get.

In contra-distinction to the cows, the head of the bull, may be shorter, the frontal-bone broader, and the occipital flat and stronger, that it may receive and sustain the horn—and this latter may be excused if a little heavy at the base, so its upward form, its quality and color be right. Neither is the looseness of the skin, attached to, and depending from the under jaw, to be deemed other than a feature of the sex, *provided* it is not extended beyond the bone, but leaves the gullet and throat clean and free from dewlap.

The upper portion of the neck should be full and *muscular*, for it is an indication of strength, power and constitution. The spine should be strong, the bones of the loin long and broad, and the whole muscular system wide and thoroughly developed over the entire frame.

### NORTH DEVONS.—THE COW.

*Purity of Blood*, as traced back satisfactorily to importations of both dam and sire, from known English breeders, or as found in the lately established Herd-Book for North Devons—40.

*The Head* should be small, lean and bony, the forehead wide, flat, or from a fullness of the frontal bone over the eyes, somewhat dishing; the face straight; the muzzle fine; the nostrils open; the lips thin and rather flat—2.

*The Nose* of a light delicate color, it being a test of pure blood—2.

*The Eye* should be bright, prominent and clear, but mild and gentle in its expression, as indicative of that spirited, but tractable disposition so necessary to cattle that bear the yoke; a beautiful orange colored ring should invariably surround the eye—1.

*The Ear*—thin; of a rich orange color within, of medium size, with a quick and ready movement, expressive of attention—1.

*The Horns*—light, tapering, of a waxy color towards the extremity, and gaily, as well as symmetrically placed on the head; the occipital bone narrow, thus bringing the base of the horns nearer together—1.

*The Neck* of medium length, somewhat light in substance, very clean, and pretty well set up on the shoulder—1.

*The Chest*—deep and round, carrying its fullness well back of the elbows, thus affording by the aid of a springing rib, abundant internal room for the action of the thoracic viscera, the heart and lungs, and that too without an extreme width forward, and between the the points of the shoulders, which might interfere with the action of the animal—8.

*The Brisket*—it being assumed that it adds nothing to the internal capacity of the chest, must not overload the breast, but be sufficiently developed to guarantee a feeding property, attended with a full proportion of fatty secretion—2.

*The Shoulder* is, in this breed, a very beautiful and important point, and should in a *degree* approximate in form to that of the horse. It should take a more sloping position than is found in most other breeds, with its points less projecting and angular, and the blade bone more curved, thus blending with, and forming a fine wither, rising a little above the level line of the back—3.

*The Crops* full and even, forming a true line with the somewhat rising shoulder and level back, without either deep or hollow—2.

*Back, Loin, and Hips*, broad and wide, running on a level with the setting on of the tail—6.

*The Rumps*—lying broad apart, high, and well covered—3.

*The Pelvis*—wide—3.

*The Twist*—full and broad—3.

*The Quarters* long and thoroughly filled up between the hooks, or hip bones, and the rumps; with a good muscular development down the thigh to the hocks—4.

*The Flank*—moderately deep, full and mellow in proportion to condition—1.

*The Legs* not too short, and standing as square, and straight behind, as may be compatible with activity. The bone quite small below the hock and knee; the sinews large and clean, with the fore-arm well developed—3.

*The Carcass* round and straight; its posterior ribs almost circular, extending well back, and springing nearly horizontally from the vertebra, giving, in fact, much greater capacity than would at first appear—4.

*The Tail*, at its junction, level with the back, long, very slender in its cord, and finishing with a tassel of white hair—1.

*The Color*, in its *shades* and *degrees* is more or less governed by fashion; but in the Devon is always red. Formerly a rich blood-red was the favorite color, and a test of purity; and now a somewhat lighter color is in vogue, approaching rather nearer to that of the South Devon, which is a larger, coarser, stronger animal. In all cases the color grows lighter round the muzzle, while a dark mahogany color, verging almost to a black, and growing yet darker about the head, always was a very questionable color for a *true* North Devon, more especially when accompanied by a dark nose—1.

*The Hair* should be short, thick, and fine; and if showing on its surface a fine curl, or ripple, it looks richer in color, and is supposed to indicate a hardier and more thrifty animal—1.

*The Udder* should be such as will afford the best promise of capacity and product—1.

*Carriage.*—The Devons having from their excellencies in the yoke, another destiny besides that of the butcher's block, it is all important that the animal's carriage should indicate as much; but to obtain this, something of the heavy, inert, squarely moulded frame of the merely beefing animal must be relinquished for a lighter and more active frame—4.

*Quality.*—The skin elastic, flexible, and not too thin, resting on a rich, mellow, yielding substance between it and the muscle—8.

Same general remarks in regard to points of the Devon bull, as made in reference to the Short-horn.

The points of Herefords and Ayrshires will be given in our next.

# Orchard and Garden.

### BLACK KNOT IN PLUM TREES.

Mr. Editor:—In answer to the inquiry of a New Hampshire correspondent, respecting the scab or black knots on plum trees, I will state what I know respecting it. The first I saw of it was about thirty years ago, in the vicinity of New York. It then was supposed to be a disease, as many think now, and not an injury caused by insects, and extending no great distance from the place occupied by a grub or maggot, no doubt the offspring of a winged-fly or miller that punctures the twig, and deposits the nit or egg—similar to what is called the seventeen year locusts, but producing different effects on the twig. The locusts punctures so deep, and in such close succession for several inches, that the twig soon dies, and breaks off close to the live wood, and falls to the ground, which becomes its home for a series of years, until it undergoes a metamorphose and is furnished with wings; its sole business being the propagation of its species—much the same as the miller from which the silk worm is produced, and which many of your readers are familiar with, since the days of multicaulns.

I have never found more than one worm in a place in the plum twig. They may easily be found the last of June or first of July, by carefully splitting the knots. It will do but little good by cutting them off and throwing them on the ground, but they should be immediately burned. The first I observed in this section of country was about nine years ago, on one or two of my trees, which I cut off and put in the stove, and no more appeared till last year, which I cut off and served as before. If all my neighbors would do likewise, I have little fears of their increasing to any extent. I would urge upon all who wish to exterminate such pests, to be sure to burn them without delay. L. F. Noe.

Avon, N. Y., May 11, 1853.

### THE BLACK KNOT.—A REMEDY.

Messrs. Editors:—I am glad to have the opportunity of answering your Walpole correspondent, on the subject of "Black knots on Plum trees." He will find it an easy matter to save his trees if he will be thorough in practicing the only remedy; and indeed, he or and individuals, when they understand the sanitary process, are culpable if they allow their trees to perish, and deserve none of the good things promised to "the willing and the obedient."

In the first place, all knots should be cut off in the spring, before the leaves put forth. When they appear on the large branches cut them out clean, with a knife; the wood should be taken some distance both above and below the knot, or it may again show itself, for the disease commonly extends further than the protuberance. These wounds should then be covered with waxed cloth or grafting itself. The trees must be again examined in the month of June, when a new set of knots will be found, and in these are the insects which cause them to grow, and when they are taken from the trees they should be immediately committed to the flames, and thus the whole progeny will be destroyed, and scarcely any knots will show themselves the next season, unless the insects come from neglected and diseased trees in the neighborhood. Let your correspondent practice this thoroughly, and I will warrant him a perfect cure. I would recommend him to spread over the ground as far as the limbs of these trees extend, three inches of well rotted manure and leaves from the forest. The effects will be surpising, and can be seen in the increased size of the foliage and growth during the season.

These knots are caused by the larvæ of an insect,—the eggs which they hatch from are deposited the summer previous in the branches, and the warmth of the spring hatches them; they then feed on the new wood as it is deposited, and nature, in making an effort to overcome the difficulty, causes these knots to grow or deposites an extra quantity of woody substance at this place. When they completely surround the branch, strangulation, as it might be termed, takes place and the limb perishes.

Plum trees are not the only variety of tree afflicted, but we see similar knots on the oak, the hickory, and the Sand and Morrello cherry trees, and I believe there is a variety of these insects peculiar to each of the above named trees. Thirty-five years ago, the Morrello trees of my native town, were destroyed by these knots, but the plum trees remained healthy for at least 10 years longer; but the Morrello trees which had grown in the interior remain healthy to this day. Along the Green Mountains, nearly the whole length of the State of Vermont, grows the Sand cherry—these trees are now being destroyed by this disease. Within the last four years the Morrello cherry trees of Chemung county, in this State, have become diseased with these knots, while the plum trees remain comparatively healthy. This shows that these different varieties of trees have a kind of insect not identically the same, but belonging to the same order.

In the neighborhood where I reside, the farmers say that each of their plum trees are worth more than two of their best peach trees, but even here, they are destined to disappear from the face of the earth unless more attention is paid to keeping this disease from them. For my part, I wish that this subject could be kept before the readers of the Rural, and hope that others will give their experience on this subject, in its columns. It will at least learn some of our plum growers to save their trees from this insidious destroyer. I. Hildreth.

Big Stream Point, N. Y., May, 1853.

### BEANS.—CULTURE AND VARIETIES.

We are unable to credit the following article properly—finding it unowned in a country newspaper:

The Kidney bean (so called to distinguish it from the English, or Horse bean) is so well known and so generally cultivated as hardly to need any notice here. It has, as it deserves, a place in every garden. There are two species, the dwarf or bush bean, and the pole or running bean. They prefer a light, rich soil, founded on a dry substratum; indeed anything is better than a clay or a wet, tenacious character. The bean is remarkably tender, and if planted before the ground is sufficiently warm, or if covered too deep, it is very likely to rot in the soil, or, if it does finally germinate, becomes a sickly unprolitable plant. The first of June in this State is early enough to plant the principal crop, although in a warm and sheltered situation they may be started earlier. Better plant them when they will come forward rapidly than to have them remain in the cold and wet ground six weeks without germinating. A liberal dressing of well rotted manure should be applied either broadcast and worked into the soil, or else in the hill or drill before planting the beans. The bush bean may be planted in drills two feet asunder, two inches apart in the drills, and covered an inch and a half deep. The soil should be kept loose and free from weeds by the frequent use of the hoe.—Schenck mentions the following varieties in the order of their succession for the table, as the most valuable for small gardens: the Early Mohawk, the Early Yellow Six Weeks, the Early St. Valentine, the China Red-Eye, the Rob Roy, the Brown Valentine, and the Royal White Kidney Dwarf.

The pole, or running bean, requires more room than the bush bean. The hills should be at least three feet apart each way. Put a liberal supply of compost or old dung in the hill, and if they are raised a little above the average level, it may be all the better. Plant five or six beans in a hill, and cover them about an inch deep with fine soil.—We think it well to set the poles at the time the beans are planted. The poles should be eight or ten feet high. Use the hoe frequently, keeping the soil mellow and clean. The "Horticultural" is large, early, and generally considered the best variety. The Red Cranberry is rather smaller and somewhat later, but is a very prolific variety, generally bearing until frost comes.—We consider all these varieties of pole beans much richer and better than the common white bean when dry. The White and Green Lima beans have a high reputation for the table. Schenck says: "The Green is preferable on account of size, but as regards the certainty and uniformity of a crop, the White seems to have the advantage.—They are both largely cultivated in the vicinity of cities, where they always meet with a ready sale, both when green and when dried."

### WASH FROM THE SINK.

There is probably no article that can be applied to growing vegetables, more decidedly valuable, than the wash from the sink spout. And yet this is not generally understood by farmers, and few efforts are made even by the most economical, to economize an article in which are to be found all the elements which contribute to the sustenance of vegetables in a state of perfect solution, and consequently in a condition the most readily appropriable by the organs they are designed to nourish, invigorate and sustain.

It has been computed by chemical men that the amount of *pabulum*, or alimentary matter, contained in the urine of animals, is equal to that of the solid voidings. It has also been asserted that one hogshead of soap suds, if applied in irrigation, would produce effects upon the corn crop as obvious and enduring as those resulting from a cord of the best manure. This assertion is, perhaps, erroneous; but that the effects of the article applied in the manner specified, would be highly salutary, no one who has witnessed the effects of soap-suds upon cucumbers, squashes, house plants, &c., can indulge a doubt. But the most economical method probably, of saving and appropriating this liquid to the purposes of vegetable enrichment, is to mix it with the materials of the compost heap. Any substance which will absorb it, may be made a vehicle for conveying it to the fields, such as swamp muck, which, in a dry state, readily absorbs three times its weight of water, loam, old tan, rotten leaves, straw or saw dust, all of which are highly valuable, and act favorably both on the soil and crop.—*New England Farmer.*

# Mechanic Arts, &c.

### LIST OF PATENT CLAIMS

ISSUED FROM THE UNITED STATES PATENT OFFICE

For the week ending May 10, 1853.

Asahel G. Bachelder, of Lowell, Mass., for improvements in counter sinks.

Nehemiah Dodge, of New York, N. Y., for improvement in pump valves.

E. L. Evans, of Hartford, Conn., for improvement in washing machines.

Thos. S. Minnis, of Meadville, Pa., for improvement in invalid locomotive chairs.

Jonathan W. Morrill, of Hampton Falls, N. H., for improved ditching machine.

Enoch Osgood, of Bangor, Me., for improvement in fastening to leather beltings.

Jno. W. Richards, of Hoboken, N. J., for improvement in registering apparatus for printing presses.

Jno. P. Sherwood, of Fort Edward, N. Y., for improvements in machines for making wrought nails.

Frederick E. Sickles, of New-York, N. Y., for improvement in operating and controlling the rudders of steam vessels.

Jno. H. Snyder, of Troy, N. Y., for improvement in machines for making hook-headed spikes.

Geo. A. Whipple, Newark, N. J., for improvement in manufacturing malleable iron directly from the ore.

D. Winder, of Xexia, O., for improvement in locomotive engines.

Chas. F. Sibbald, of Philadelphia, Pa., for improvement in paint compounds. Patented in England, Oct. 15, 1853.

John Mee, of Lowell, Mass., assignor to Jno. Mee and John Rourke, of same place, and Gilbert Mackennon, of Portsmouth, N. H., for improvement in knitting looms.

John Mee, of Lowell, Mass., assignor to Jno. Mee and John Rourke, of same place and Gilbert Mackennon, of Portsmouth, N. H., for improvement in warp net fabrics.

James M. Patton and Wm. H. Fergus, of Philadelphia, Pa., assignors to Jno. C. Da Costa, of same place, for improvement in tonguing and grooving and moulding cutters.

James Young, of Philadelphia, Pa., assignor to Jno. W. Middleton, of same place, for improvement in printing presses. Ante-dated Nov. 10, '52.

#### DESIGNS.

Samuel H. Sailor, of Philadelphia, Pa., assignor to James G. Abbott and Archibald Lawrence, of same place, for design for a cooking stove.

Julius Holzer, of Spring Garden, Pa., assignor to James G. Abbott and Archibald Lawrence, of of Philadelphia, Pa., for design for a cooking stove.

Edward F. Robinson, of Boston, Mass., for design for a cooking stove.

### MAKING SHOVELS.

Pardon a brief descent to details, gentle reader, and imagine yourself holding in your hand a bran new "Amos's Cast Steel Shovel," to serve for a text. Do you know that useful tool is the result, by virtue of a wise division of labor, aided by apt machinery, of some *forty* different processes, not including the make of the handle, which came with millions like it, from Maine, where trees are plenty? Such is the virtual fact. Space will not allow of minute description; but a few items will furnish convincing proof.

In the first place by a knife of irresistible edge as it obeys the irresistible force of the "water power," a plate of the right size is cut from a sheet of steel as if it were a sheet of silk before the scimitar af Saladin. Two more similar clips from two similar knives give the right outline for the shovel. To remove the "black scale" the plate is ground on a grindstone; then it is punched for the rivets which are to hold the back and front straps to the blade; then, after having been heated, its surface is shaped by pressure between two dies with a weight of about 1,200 pounds. Next comes the "setting" done by hand, to remove "wakes," straighten sides and correct twists. A vitriol bath to remove scales, and a vigorous polishing on wheels covered with emery, dismisses the plate for the present, and leaves us at liberty to prepare the "straps" needed to bind it to the handle. These are cut, rolled, sheared, pounded, leveled, shaped, annealed, polished, countersunk, &c., mostly by ingenious machinery, and then they are riveted to the front and back of the shovel, close as you see them, fitting like a glove that fits as a well behaved glove should.

We move on now to the handle shop.—The two holes for rivets in the head of the handle are bored at once, by bits revolving two thousand times a minute. The "bending" to give the graceful curve and right balance for easy working, is an amusing operation. The lower end is boiled for an hour or two to take the obstinacy out of it and make it pliable. When it is soft enough to be docile and manageable, it is placed between two iron blocks, with the rightly undulating grooves and connected by a hinge, as a lemon is put into a squeezer; and then the blocks are brought together by a powerful pressure and fastened, and so the prisoner is kept encased until he grows cool and promises never to straighten himself out.—With this understanding he is released and put away for three weeks to dry, and get thoroughly seasoned for the laborious life before him. How the caps to the rivets and the rivets themselves are made, how the handle is inserted between the straps and screwed and wedged, how all rough edges are filed down, and wood and iron rendered agreeable to the hand,—how the plate is scoured and all metal parts of the tool burnished, and the shovel complete is made bright, clean and trig ready for inspection—we have neither time, room, nor descriptive power to tell. Suffice it to say that such facility and perfection has been attained in the manufacture of the respective parts, and such the number of persons employed, that on the average a shovel is made now in less time than it once took to bore the holes through the head of the handle. Experiment and ingenuity and industry have achieved this really marvellous result in this model establishment, whose name and fame are such, that it has not been able for years to fill all its orders or to supply the demand for its products. This success is greatly due to strict observance of these principles, viz: 1, that the labor shall be divided into as many distinct processes as possible; 2, that each man shall learn but one process, and learn that thoroughly; 3, that each workman shall be paid so much per dozen for his work—so if indolent he shall be the loser, and if industrious the gainer; 4, that the shovels shall be inspected at every stage of their manufacture, and when they are finished, in order to guard against poor work; and 5, that none but the very best materials shall be used.

Of the statistics, of "Shoveldom" it is enough to say—omitting all reference to its indirect effects,—that it uses each day 4 tons of iron and 2 tons of cast-steel,—it employs 250 men, paying them from 5 to $6 000 per month in wages,—turns out more than 2000 shovels of various styles and prices per day,—and sold last year something like $600.000 worth of its fabrics. In view of these figures were we not right in designating "Shoveldom" as a kingdom; and who will deny that its liberal-minded, intelligent and enterprising proprietors, have been and are, in the way of business, benefactors to the community, by furnishing employment to so many operatives, creating as it were a thriving town, and equipping armies for the peaceful physical conquests of the times? No one certainly who has visited their establishment.

### SELF-ACTING SWITCH.

The ordinary switches require an attendant to operate them, and are therefore exceptionable in many points of view; they are costly, and are liable to dreadful accidents if by any cause they are neglected to be turned in a proper direction for passing trains. To remedy these disadvantages, an improved switch, which is self acting, has been invented by Theodore Sharp, of Chatham-4-corners, N. Y., who has taken measures to secure a patent. By this contrivance the passing trains are made to operate the switches by bearing in their course upon levers which are placed vertically on pins secured on the outer side of the rails, and are forced down horizontally as the wheels pass over them, drawing the rails to the required direction for the cars. To effect this object, the pendulous levers just mentioned are connected by a cross-piece, and longitudinal bars that are part of their length made flexible to the switches, which, when in a right position for the passage of the train, are secured by a catch on one side. There is likewise a contrivance for unlocking the switches when it is required to reverse them by means of bent rods and rock shafts, and the entire apparatus is kept from injury in a case of any suitable form, as may be required.

The above is copied from the *Scientific American*, and is probably the inventor's own statement. But if the invention is all that it is intended to be, and is actually an efficient self-adjusting switch, it is one of the utmost importance, and will make the fortune of the inventor.

### SAFETY WHIFFLETREE FOR CARRIAGES.

A new method of constructing whiffletrees for carriages, whereby the horses may be disengaged from the carriage by the driver at any time he may wish to do so, has been invented by Elisha Harvey, of Whately, Mass. The method employed by the inventor is the following:—An additional short whiffletree or bar is attached in the usual manner to each end of the double whiffletree. The arms of these two bars or levers are of unequal lengths from the place where they are attached, the short heavy end of each bar extending but a short distance beyond the farther end of the whiffletree, where it forms a hook to which the single whiffletrees are attached; the longer ends of these bars extend nearly to the centre of the double bar, at which place they form a fulcrum upon a slide bolt or lock, which bolt passes through the whiffletree in front of the ends of the bars, and is retained there by means of a strong helical spring. When it is desired to liberate the horses from the carriage, the slide bolt is raised by the driver by means of a cord or other convenient device, and the opposite end of the bar allowed to swing round upon an axis at the end of the double bar, and thus disengage the horse by liberating the single whiffletree from the hook. Mr. Harvey has taken measures to secure his invention by patent.—*Scientific American.*

Wet and Dry Coal.—The last trip of the Pacific, from Liverpool to New York, a trip which requires a very large consumption of fuel, proved the superiority of coal which had been kept dry to that which had been lying in the air for a long time exposed to moisture. This vessel, while dry and well preserved coal lasted, made an average of more than 300 miles per day, but when she was compelled to use coal that had been lying in a damp yard through raining and freezing weather, in a large mass, for many months, her speed was reduced about fifteen per cent.—*N. Y. Express.*

Dr. Alexander Mayer, of Paris, announces that he has been able to obtain heat for all the purposes for which heat is now used, by means of friction. An apparatus for this purpose will soon be exhibited to the public.

# Educational.

## SUBORDINATION.

To the parent and teacher, and pre-eminently to the scholar himself, the habit of subordination is one of the greatest value and importance. So much of the usefulness and happiness of after life—so much of the present peace and pleasantness of the family and school—so much of the efficiency of all training and culture, depend upon due obedience and submission to authority, that we can scarcely be mistaken in ranking this as the earliest moral lesson—as the foundation upon which all that is valuable, all that is "lovely and of good report" in the whole being, power, and character of the man is erected.

By subordination, we mean respectful obedience to parents and those to whom their authority may be delegated, and to the paramount laws of society and the State.—No human being can be left alone to the guidance of his untrained and unregulated will with safety to himself or to community. And no one of matured age and experience regrets that, when a child, he was not left to act his own pleasure, but taught to obey the dictation of wiser minds than his own. No wilful man, no disobedient child, but in a thousand instances, sees cause to regret his wilfulness and disobedience,—this conclusion forced upon him by the consequences of insubordination.

Most weighty are the responsibilities which rest upon those who have to do with the early training and control of children.—This duty must be enforced, this habit formed, or neither family, social, or civil organizations can be sustained among men. Every one who has seen, must pity the petted, indulged, and in fact, "spoiled child."—the victim of misjudging affection, and of its own fretful and capricious waywardness.—We *must* pity, and it should grieve us to know that there is not only a child spoiled but a man blasted—for one left to follow the selfish and wayward whims of childhood can never be a strong-minded and independent man, but must still be petted and indulged by others, and eventually become a morose and disapointed if not an openly vicious being, and worse than a blank in society.

The child whose will is subordinate to that of his parents and teachers—who forms habits of enlightened obedience in youth—will pass pleasantly among his fellows, and will reverence and obey the laws of his country. But that child is little likely to prove an agreeable member of society or to act the part of a good citizen, who, as a child, submitted to no authority but that of his own unbridled passions—who obeyed no laws but those which he *could not* infringe.

—We would not have the "spirit" of a child cowed and broken into unquestioning submission—but we would have it made to recognize the claims of others—to know that others possess rights, privileges, and feelings as important and as sacred as its own. We would have it acquire the habit of looking upon all questions brought before it for decision or action, not from the point of self alone, but in reference to the duties and relations of life, by one member of society to another. Were all children thus taught, the anarchy, confusion and crime, now prevailing so largely among our juvenile population would soon come to an end.—B.

## THE SPIRIT OF A SCHOLAR.

In the life of a scholar are certain elements, which, if rightly directed, will not fail to give elevation and power to his example. He controls in a great measure, the fluctuating tide of public opinion, and contributes largely in giving tone to the literature, the enterprise and morals of the age. His spirit is felt through all the activities of society. His productions are considered as among his country's dearest treasures—the light of his genius as her brightest ornament.

But let us notice these elements of a scholar's life more in detail. The basis of a vigorous independence, and of every scholarly vritue is a meditative spirit—deep, original thought. This alone can create.—The true scholar thinks for other men and other times. He is not a dreamer—lingering merely on the surface of popular sentiment. Nor is he content with alone repeating what others may have said, and doing what others may have done. He looks above time and sees a host of literary worthies, thus elevated and crowned, not in virtue of their heaven-bestowed genius, but as the reward of severe and earnest labor. Those bold, energetic minds ever unwilling to build in the dust, rather despising the *metum pecus*—the ignoble herd—would they climb to those high realms where imperial thought holds dominion.

The true scholar shrinks not from a problem, because it is difficult and mysterious. This amounts to treason against the laws of intellectual domain. For the obscurity which to us is so repulsive is not formed in the subject, but in the feebleness of our understanding. The darkness that intercepts the progress of research and dims the perception, is a defect in the mind's aptitude, and not an inherent viciousness in the question proposed.

When we are met by those dark and difficult subjects, instead of yielding to the imagined mystery that gathers about the solution, let us struggle on until we surmount all personal perplexities; then will the path of investigation become easy and delightful. If we are repulsed in our first attack, our alternative is another trial. As you multiply your efforts, be sure also to augment the energy and perseverance adequate to the undertaking. Robert Bruce, restorer of the Scottish monarchy, being out one day reconnoitering the enemy, lay all night in a barn belonging to a loyal cottager. In the morning, still reclining his head on the pillow of straw, he beheld a spider climbing up a beam of the roof. The insect fell to the ground; but immediately essayed the second time to ascend. This attracted the notice of the hero, who, with regret saw the spider fall a second time from the same eminence. It made a third unsuccessful attempt; and a fourth, and still others. Not without a mixture of concern and curiosity the monarch twelve times beheld the insect baffled in its aim; but the thirteenth essay was crowned with success; it gained the summit of the barn, when the king, starting from his couch, exclaimed—"This despicable insect has taught me perseverance—I will follow its example. Have I not been twelve times defeated by the enemies' superior force?—on one fight more hangs the independence of my country." In a few days his anticipations were fully realized by the glorious result to Scotland of the battle of Bannockburn. It may be thus with you, kind reader; your next effort may date an achievement of untold importance.

The mind of original research is cautious in the reception of any new theory or wild speculation that may be started. It examines with closest scrutiny the claims of every system upon public confidence. It studies its relations upon its own facts, and the harmony of its tendencies with the accredited results of experience. This bold scrutiny not only surveys each fundamental truth, and gives a proper adjustment to all its bearings; but it looks over the dreary wilds of conjecture, and the vagaries of a sickly fancy, to determine what may be worthy of approval.

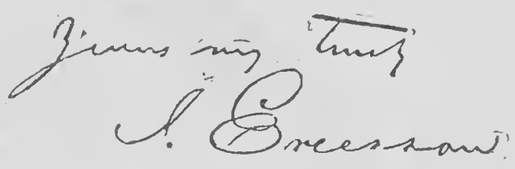
## THE CHILD TO BE GOVERNED.

The first difficulty and greater than all others encountered by the teacher in the management of his school, springs out of the failure of parents to control their children at home.

The direction of Solomon to "train up a child in the way he should go," has apparently not yet secured universal conversion to its wisdom and authority. The child not habituated to restraint at home, knows of no reason why he should not enjoy all the personal liberty and license elsewhere, which the parental roof affords him. He, therefore, regards the attempts of the teacher to control him as usurped authority, and behaves himself accordingly.

In The Teacher, a new and excellent journal just started at St. Louis, there are some remarks on this point which are eminently just and appropriate:

"The greatest error of American parents, is their blindness not to see, or, through misplaced affection, not to heed the faults of their children. To such an extent is this error carried, that they indulge them as far as possible in all their whims and desires, and never check them in their waywardness. Indeed, so great has this evil become that it threatens to dissolve the bands of society, and set all law and authority at defiance. That the duty of subduing the refractory and instilling principles of subordination and respect for law and authority, is now alarmingly neglected by parents, is too self-evident for denial. That it is essential to the welfare of the community and happiness of the individual, and that it should be done, no one will question. But when or where ought it to be done? Unquestionably under the paternal roof. But as it is not, it must be done in school, or the individual must be abandoned to the correcting hand of justice, as administered in our courts and prisons. This is a great responsibility devolving upon the teacher, and to discharge it faithfully, he ought to have parental sanction and authority. In how many instances is this obtained? Scarcely ever, if we except a few cases, when the children have become so rude and ungovernable at home, that parents acknowledge their inability to control them, and send them to school expressly to have them made tractable. The teacher has a difficult and delicate task to perform, leaving him scarcely any alternative except being impaled on one or the other horn of the dilemma. If he is conscientious, he discharges his duty, even at the risk of losing his place; but if otherwise, he will humor the caprices of both children and parents, and by devices and appliances hide his deficiencies, until his disorderly school and general inefficiency become so obvious that even the blind can see it. This is the main cause of the general inefficiency of private schools. Private teachers have to humor the whims and caprices of parents, make the school-rooom pleasant to their children, exact no hard lessons, never insist upon the performance of an allotted task, and never dream of punishing them. At this rate things go on swimmingly for a while; but at last, parents, to their surprise, learn that their children are learning nothing; they withdraw them from school, and send them to another, to run the same career of folly, and ending as they began, by breaking up to-day the paragon school of yesterday."—*Prairie Farmer.*



## JOHN ERICSSON.

The inventor of the Caloric Engine has of late occupied a large share of public attention, and hence we have procured a portrait which we give above, with the following brief biograpical sketch from the Family Journal:

John Ericsson is, by birth and descent, a Swede, and was born in the province of Vermeland, on the 31st of July, 1803, his father at that time being connected with a mining company in that part of the country. When quite a child he was remarkable for the mechanical ingenuity which he displayed, and at the early age of 11 he attracted the attention of the celebrated Count Platon, Viceroy of Norway, who became his patron and procured him the appointment of cadet in a corps of engineers. In 1816 he was made *nivelleur* on the grand ship canal, between the Baltic and the North Sea. Two or three years after, against the wishes of his parents, he entered the Swedish army, and soon rose to the rank of Captain. He received his commission from Bernadotte, one of Napoleon's ablest Marshals, and soon after his promotion was employed in the survey of Northern Sweden. In the meanwhile he devoted much reflection to his favorite study of mechanics and invented the flame engine, one of his earliest achievements, which was intended to be operated by condensed flame instead of steam.

In 1812 he visited England, where he hoped to bring his invention into public notice, but soon made the discovery that when the engine was worked by mineral fuel, it proved unsuccessful. While there, in 1829, he competed for the prize offered by the Liverpool and Manchester railway for the best locomotive, and produced an engine that accomplished the at that time wonderful speed of 50 miles an hour. This was the first engine of high speed that was ever produced, and it is needless to add, it won the well earned prize. In this connection we may state that Capt. Ericsson was the first man who ever built a tubular boiler with artificial draft. His inventive mind also constructed a steam fire engine which has been long successfully used in that country. The screw propeller was also by him introduced and brought into practical use in England and subsequently in the United States.—Since his residence here he has been the author of many important inventions and mechanical improvements. His semi-cylindrical engine, his centrifugal blower, his instrument for measuring distances at sea, his pyrometeral, sea lead, and other ingenious inventions, which we have not space to enumerate, have already made the name of Ericsson famous in the scientific world.

But his last and greatest achievement, and which bids fair to become an imperishable monument to his genius, is the Caloric Engine, intended to supercede the use of steam. This remarkable production was first brought before the scientific world in London nearly twenty years ago, (without the improvements of course which have since been added,) and was rejected by the wise *savans* of that day as an impracticability and involving the absurdity of perpetual motion. But after a short resistance the principle of the Coloric theory was finally endorsed by the celebrated Faraday and others, and its practicability admitted, with the removal of certain objections. Thus encouraged, Ericsson has steadily pursued the subject ever since, built experimental engines of various powers, overcoming obstacles that would have appalled a mind of less fertility of invention and tenacity of purpose, until now the caloric engine has arrived at the consummation of success and stands before the world a complete triumph, the cynic's cold sneer and bigot's unbelief to the contrary notwithstanding.

Capt. Ericsson is a man of about 50 years of age, has a muscular, well developed and strongly knit frame, is of middle size, has a firm tread, a person who gives assurance of reserved strength, and a head with all the proper intellectual developments—the high forehead and prominent brow, marking a man of thought and the philosopher; he has a dark complexion, with hair somewhat whitened by time, black eyes, introspective and reflective rather than observing, a decisive mouth, and the mixed temperament, combining the nervous and bilious, which distinguishes the powerful in action and steady in endurance. The head rises in a phrenological summit at benevolence, which is a distinguished feature in his character, and as an evidence of this, it may be here said that on the recent trial trip which proved so eminetly successful, the only sign of self-gratulation that he exhibited was the remark that he felt proud in the conviction that his invention would in its general application be the means of saving a vast amount of human life.

In testimony of his many useful inventions, Capt. Ericsson has received in several countries, prize medals, some of which are of great value. He is a knight of the Order of Vasa, and a member of many scientific societies, and we also add with much satisfaction that he has become a citizen of the United States.

## PROVIDENCE OF GOD IN MINUTE EVENTS.

It is an erroneous view to think of God as governing the grand phenomena of nature, and leaving those which are minute, to the operation of a set of laws which he does not uphold at every moment in all the fullness of their application. "We cannot," says Chalmers, "disjoin God from any part of the universe of God." We may despise what is small, as beneath the notice of our pride; but nothing is too microscopic for Him who, while he "measures the waters in the hollow of his hand, and metes out the heavens with a span, and comprehends the dust of earth with a measure, and weighs the mountains in scales, and the hills in a balance," yet numbers the very hairs of our heads, and knows of every sparrow that falls to the ground.

The minuteness with which God provides for all wants is well brought in the LXVth Psalm, where David speaks of Him as attending to the very setting of the furrows of the field, and the watering of the ridges. "Thou makest the outgoings of the morning and evening to rejoice; Thou visitest the earth and waterest it; Thou greatly enrichest it with the river of God, which is full of water; Thou preparest them corn, when thou hast so provided them food; Thou waterest the ridges thereof abundantly; Thou settest the furrows thereof; Thou makest it soft with showers; Thou crownest the year with Thy goodness, and thy paths drop fatness."—*Prof. Balfour.*

## FEMALE DELICACY.

Above other features which adorn the female character, delicacy stands foremost within the province of good taste. Not that delicacy which is perpetually in quest of something to be ashamed of, which makes merit of a blush, and simpers at the false construction its own ingenuity has put upon an innocent remark: this spurious kind of delicacy is as far removed from good taste as from good feeling and good sense; but the high-minded delicacy which maintains its pure and undeviating walk alike amongst women as in the society of men—which shrinks from no necessary duty, and can speak, when required, with seriousness and kindness of things at which it would be ashamed to smile or to blush—that delicacy which knows how to confer a benefit without wounding the feelings of another, and which understands also how and when to receive one—that delicacy which can give alms without assumption, and which pains not the most susceptible being in creation.

Coleridge, speaking of short epigrammatic sentences, says:—Such a style an ancient critic would have deemed purposely invented for persons troubled with the asthma to read, and for them to comprehend who labor under the more pitiable asthma of a short-witted intellect.

Whoever wishes to harvest the tears of pity must sow unsparingly the seeds of generous love.

## THE HOUR OF PRAYER.

BY IDA FAIRFIELD.

Know ye the hour for prayer—
The hour to lift the soul on high,
To Him who dwelleth in the sky,
Enthroned in air?
To plead for His protecting power,
Who maketh every bird and flower,
His own especial care.

Perchance ye deem that time,
Comes only with the mornings balm,
Or in the evenings hour of calm,
Or noon days prime.
Perchance ye dare not lift a sigh,
Save as the stated hour draws nigh
For worship so sublime.

Think not a Fathers care
E'er wearies of the uplifted eye,
The spirits low appealing cry—
The heart laid bare—
Whene'er that heart with sorrow fills,
Whene'er its pulse with pleasure thrills,
Then is the hour of prayer.

If dreary is the day—
If care and sorrow, hand in hand,
With dark misfortunes ghostly band,
Meet o'er lifes way—
If deaths dark form is hovering nigh,
To sever some best cherished tie—
Oh! lowly bend and pray.

If joy be on the heart,
And life's full cup is brimming o'er,
With earthly bliss, a plenteous store—
No tear to start.
If love's warm spell, is o'er ye thrown,
And health and wealth, and friends your own;
Pray, ere that joy depart.

If e'er the soul grow strong,
Amid this dark world din and strife,
With yearnings for a better life,
More freed from wrong—
Pray, when that blessed thought is given,
Be it at morning, noon, or even,
The hour to God belongs.

Pray then—oh! watch and pray!
How glorious the thought, that He,
Whose slightest nod is Heavens decree,
Will kindly stay,
For our weak cry, his outstretched arm,
Will spare all vengeance, and from harm
Protect and guide our way.

Walton, N. Y., April, 1853.

## "TAKE HEED HOW YOU HEAR!"

How many, not only of those who are mere spectators, but worshippers in the sanctuary, are heard to complain of their minister's dullness in the pulpit. To such an one, who finds no good thing in the sermon, I would put a question or two.

Has it ever occurred to you that the fault may be in yourself, rather than in the sermon? Have you not heard that James S. was aroused from his infidelity by means of that dull discourse? Let me remind you, my brother, that as the sufferer from nausea loathes the moist, dainty food, craving only that which would be rejected by the natural appetite, so may not you, from your own lack of interest in the Gospel, turn from him who speaks of the glorious future it offers to every believer, to listen to one who will plunge you in a deeper sleep with his words of peace?

What matters it to the blind, that you bid him look on the fairest picture that ever came from the hand of the Great Artist? To him it is all a blank. What charm has the sweetest music, for him whose deafness makes the world one vast pantomime?—Could you preach to the satisfaction of those whose thoughts were away in the world?

Does it not gladden your heart to hear your best friend praised by another, though the praise come from a heart too warm to study the best models of expression? Would you know how to listen to good sermons, always? Never start for the house of worship till you have knelt to pray that your preacher may speak as may be most to the honor of your Father in Heaven, and that yourself may receive the truth into a good and honest heart. If a whole congregation should toil and pray for the moral regeneration of those around them, could their minister's dullness, or opposition, prevent it? Suissac.

Cure for the Blues.—Luther says, "When I am assailed with heavy tribulations, I rush out among my pigs rather than remain alone by myself. The human heart is like a millstone in a mill; when you put wheat under it, it turns and grinds and bruises the wheat to flour: if you put no wheat in, it still grinds on, but then it is itself it grinds and wears away."

Novel Reading.—It cannot but be injurious to the human mind never to be called into effort. The habit of receiving pleasure without any exertion of thought, by the mere excitement of curiosity and sensibility, may be justly ranked among the worst effects of habitual novel reading.—*Coleridge.*

If rich, it is easy enough to conceal our wealth; but, if poor, it is not quite so easy to conceal our poverty. It is less difficult to hide a thousand guineas, than a hole in our coat.

In matters of conscience, first thoughts are best; in matters of prudence, last tho'ts are best.

# Miscellaneous.

For the Rural New-Yorker.

### FAREWELL.

Fast the hours are fleeing, mother,
Must I say farewell so soon—
Must I leave the home of childhood
E'er my life has reached its noon?
O, my weary heart is breaking,
Tears have ceased to bring relief,
Words may never tell the anguish
Of this first and bitter grief.

Mother, fold your arms about me
Once again ere I depart;
Let me hear your tones of music
Falling gently on my heart.
O, when in the land of strangers
I shall miss that voice so mild,
Wilt thou still at eve and morning
Pray for blessings on thy child?

O, when thoughtfulness comes o'er thee
Shall I ever claim a tear?
Now upon thy heart I'm resting
Shall my place be ever here?
Surely thou wilt ne'er forget me!
Though I have been vain and wild;
O, I know thy gentle spirit
Blesses still thy wayward child.

But I'll dash away the tear-drops
And my lip shall wear a smile,
Though my heart is madly throbbing,
'Neath its weight of grief the while.
'Tis the world's first, bitter lesson,
Far from home and *thee* to go;
We shall meet again, my mother,
But oh! shall we meet *below?* JENNY.

### SPRING HAS COME!

Behold, Spring has come! A new life breathes in the young foliage. What a splendid appearance the trees receive from their blossoms! How the birds rejoice amid the branches! The delicate cheeks of flowers which the cold of winter has concealed, are delightfully colored; the world moves lively in all parts, and gathers to itself the splendors of spring.

The silvery streamlets come down from the mountains, and dance along the green dales; the sparrow is without fear, and sends forth her melodious songs; all colors begin to glitter; the garden becomes variegated with a thousand flowers,—shining rays begirt the whole world.

Behold, then, all nature is animated: each spring adds beauty and vigor to the preceding. Let man imitate the gentle yet vigorous spring: let him who was industrious before, not relent his vigor, but like spring renew his labors with greater diligence and activity, while he who has become indolent through the long winter, should rouse all his energies. Consider spring an active and diligent adventurer, now roaming through distant lands during the heat of summer, then returning to his cheerful home, amid the rains of autumn and the cold of winter; and finally, after having undergone hardships, discouragements, and even indolence, arrived at his home again, and there renewing all his efforts,—improving all, and enjoying the successful issue of his sweet labor. S. T.

Rochester, N. Y., May, 1853.

### THE KITCHEN.

Talk of the parlor, with its touch-me-not elegance—we care nought for it. Let its covered magnificence riot in darkness, its rod velvet lie in shrouds—its pictures gaze dimly through crape—its splendid piano, stand dumb in its linen cover—its worsted roses and pinks, and gilli-flowers remain unplucked in dark corners—its carpet bloom unseen. Let the shutters and double curtains exclude every beautiful ray of light; it is welcome to its darkness and its solitude while we can have the pleasant, airy, yellow-floored, uncarpeted kitchen.

That is the place for real enjoyment—the kitchen, with its bright shelves and clean, white tables, white with time. The kitchen, with its comfortable old easy chair, and broad shining hearth—and cracking, blazing fire.

We do not mean the kitchen in the great house, where lazy servants have entire control, and the lady of the house never sets her foot within its precincts, but the homely, comfortable kitchen of the well-to-do working man, where the wife and the tea-kettle sing together, and little children prattle round the mother while her own hands set the table for tea.

There may be snow in the gloaming, or sun-arrows lodging in the tops of the trees—there may be city walls about, or blue water and undulating hills. It matters not—in such a place every thing smacks of true comfort.

Make the kitchen attractive and pleasant by all means. How absurd to keep one room in constant state, as it were, for the pleasure of a chance caller, or a few party-going friends! We wish no further evidence of a bad house-keeper than to see her parlor in full dress, her kitchen down at the heel, and her chambers in confusion. Make the home-place the most agreeable, or if your many duties allow not time to attend as thoroughly as you would wish to its adornment and refinement, throw open the doors of your best room, and let your family enjoy it. Pray who should, if not they?

In seeking to do good, we get good; in seeking to make others happy, somehow or other we are almost sure to become happy ourselves.

### THE JAPANESE.

In Japan the beds of the inhabitants consist, according to the circumstances of the owners, of large silken or cotton quilts, lined with thick wadding, which is taken out previous to their being washed. The Japanese fold their coverlets double, and spread them on the floor, which even in the humblest cottages, is covered with beautiful soft straw mats. On retiring to rest, they wrap themselves in large night dresses, with short full sleves; these are likewise either of cotton or silk, and are thickly wadded. Instead of pillows, they make use of pieces of wood, carved in various forms. The common people place under their heads a piece of round wood, hollow at one end, and, from custom, sleep as soundly on this as on the softest pillow. The higher, or rich class, makes use of a very neat box, about eleven inches high, to the lid of which an oval cushion is affixed, from six to eight inches in length, and from two to three in breadth. The box contains articles which they make use of at the toilette, such as razors, scissors, pomatum, tooth-brushes, powder, &c.

The Japanese neither make use of spoons nor forks, but eat their victuals with two slender reeds. Food of a fluid nature they sip out of a dish, as we do tea. The fruit, such as apples, common pears, were not yet perfectly ripe (in August;) but they suited the taste of the Japanese, who are extremely fond of acids. In the yard of our house (at Tatsmai) there was a peach tree loaded with fruit; but they plucked all the peaches before they were ripe, and ate them, occasionally giving us some. We could eat them only when they were baked; but the Japanese devoured them with a voracious appetite, either raw or baked. The Japanese have no looking-glasses. Their metal mirrors are, however, so exquisitely polished, that they are scarcely inferior to the finest glass.

Wood is the only article used for building in Japan. The Japanese, however, declare that they can build with stone as well as other nations; but they are prevented from so doing on account of the violent earthquakes. Their interiors are generally splendid, the large rooms being divided by screens of paper or wood, richly gilded, carved and adorned with landscapes, &c., like the boxes and cabinets which are imported into Europe. The floors of the great are covered with finely wrought tapestry. The Japanese burn a fire on the hearth from morning till evening both in winter and summer; men and woman sit round the fire and smoke tobacco. The kettles are never off the fire, as tea is their common beverage for quenching thirst; if they have no tea they drink warm water, but never taste cold. They never wear boots nor shoes, but make, with plated straw or grass, a kind of sandals.—*Japan and Japanese.*

### THE BIRD OF PARADISE.

There are few birds that have more deceived and puzzled the learned than this.—Some have described it as an inhabitant of the air, living only upon the dew of heaven, and never coming down to the earth. Others have acquiesced in the latter part of the history, but have represented it as feeding on flying insects. Some have asserted that it is without feet, and others have ranked it among the birds of prey.

The great beauty of this bird's plumage, and the deformity of its legs, seem to have given rise to these erroneous reports. The savages of the Molucca Islands, of which it is an inhabitant, perceiving the inclination the Europeans had for this beautiful bird, carefully cut off its legs before they brought it to market. Thus concealing its greatest deformity, they considered themselves entitled to rise in their demand, when they offered it for sale. One deceit led to another. The buyer, finding the bird without legs, naturally enquired after them; and the seller as naturally began to assert that it had none. Thus far, the European was imposed on by others; in all the rest he imposed upon himself. Seeing so beautiful a bird without legs, he concluded that it could only live in the air, where legs were unnecessary. The extraordinary splendor of its plumage assisted this deception, and, as it had heavenly beauty, so it was asserted to have a heavenly residence. Hence its name, and all the false reports that have been made concerning it.

Error, however, is short lived, and time has discovered that this bird not only has legs, but very large ones for its size. Soon after the discovery was made, this harmless bird was branded with the character of being rapacious, of destroying all birds of a smaller size, and from the amazing rapidity of its flight, as well qualified for a vast deal of mischief. The real history of this pretty creature is at present tolerably well known, and it is found to be as harmless as it is beautiful.

There are several species of the bird of Paradise. Some of them are as large as a pigeon, though in reality the body is not much greater than that of a thrush. The tail, which is about six inches in length, is as long as the body. The wings are large, compared with the bird's other dimensions. The head, the throat, and the neck are of a pale gold color. The base of the bill and the side of the head and throat are surrounded by black feathers, which are as soft as velvet, and changeable like those on the neck of a blackbird. The hinder part of the head is a shining green, mixed with gold. The body and wings are chiefly covered with beautiful brown, purple and gold feathers. The uppermost part of the tail feathers are of a pale yellow, and those under them white and longer than the former, for which reason the hinder part of the tail appears to be all white. But what chiefly excites curiosity are the two long, naked feathers which spring from the upper part of the rump above the tail, and which are usually about three feet long. These are boarded only at the beginning and the end; the whole shaft, for above two feet nine inches, being of a deep black, while the feathered extremity is of a beautiful changeable color.

This bird, which for beauty exceeds all other species of this genus, is a native of the Molucca Island. There, in the delightful and spicy woods of the country, these beautiful creatures fly in very large flocks, so that the groves which produce the richest spices, produce the finest birds. The inhabitants themselves are perfectly aware of the great beauty of these birds, and give them the name of God's birds, as being superior to all others in existence. They live in large flocks, and at night generally perch upon the same tree. They fly very rapidly and are almost continually on the wing, in pursuit of insects, which form their usual prey.

### THE PEDLAR NUISANCE.

The Ontario Repository has the following article on the subject of "Itinerant Merchants," a large class of whom are nuisances, not only in cities and villages, but everywhere:

Every body knows, that our village, with most country towns, is habitually visited by a class of traders, whom we have characterized, as itinerant merchants, who seriously invade, the proper province of our own local traders. These wandering Phœnicians vend an inferior article. They are not tax-paying inhabitants. Not being residents, they contribute nothing to the general prosperity of the village. The principal effect of patronizing them, is to give them so much money to be lugged out of town and substracted from the aggregate sum of village circulation. Yet citizens, whose surplus goes to support our institutions, and is expended in our midst, are constantly liable to be undersold by these swarming pedlars, who sell for nothing, a worthless article, that costs them nothing.

Now we presume to say, in such cases, the preference ought to be given to citizens, whose profits are profitable to the village. Men whose prosperity assists to build up the town, should be encouraged in all reasonable ways to contribute that assistance. Men whose surplus goes to our benevolent institutions, should be sustained in their spirit to bestow such charities. Men whose earnings are taxed to defray our village expenditures and multiply our village accommodations, should be stimulated to accumulate the earnings that thus steadily honor every village draught. This is emphatically true of our local merchants. They are permanent residents, whose prosperity, while it contributes to their own support and comfort, shares the burthens and answers the wants of the public at large.

Why then shall a class of traffickers be encouraged to take money out of town who bring none in exchange? Why should our own ability be lessened to sustain our own burthens? Why should our citizens, who take the pains to accommodate us with an article worth its price, be constantly liable to be undersold by mere street hawkers of glossy and fraudulent wares? These pedlars procure trash, in the first place, at trashy prices. Their whole system of commerce is a game of unmitigated imposture. They expect to get a living and do get one, without rendering an equivalent. And the brazen impudence with which they swagger before the public, offering their basswood cheese and wooden nutmegs to the purchase of an honest community, is in striking harmony with the unscrupulous character of their lives.

These creatures are influenced by no sense of personal responsibility. They travel from place to place, *unchecked* by public opinion. In consequence of their cosmopolitan mode of life, they may indulge their propensity for fraud and falsehood with impunity, and without the possibility of a tribunal to arraign and punish them. We say the public opinion of every town should drive them out of the corporation. Let the men who pay the taxes enjoy the patronage. *Drive out the pedlars* and let the men who assist to support your institutions, enjoy your partiality.

Poppy Oil.—Dr. J. V. C. Smith, of Boston, says that immense crops of poppies are raised in Switzerland, not for the opium, but for the oil extracted from their seeds. This oil is beautifully transparent, extensively used in house painting, colorless as water, and when mixed with white lead, leaves a beautiful surface that never becomes yellow. Now that linsed oil is rising in price, and as much of our soil is unfit for the cultivation of flax, he advises the attempt at cultivating the poppy here, which does very well, even on poor, sandy soil. He says, too, that the oil is quite palatable for salads.

A Fool's Decision.—A poor beggar in Paris, being very hungry, stayed so long in a cook's shop who was dishing up meat, that his stomach was satisfied with only the smell thereof. The choleric, covetous cook demanded of him pay for his breakfast.—The poor man denied it, and it was referred to the decision of the next man who should pass by, who chanced to be a most notorious idiot. He determined that the poor man's money should be put betwixt empty dishes, and the cook recompenced by its jingling, as he was satisfied with only the smell of the cook's meat.

The man who abuses a thing of which he is utterly ignorant, unites the infamy and baseness of an informer and a false witness—and in addition to this, makes himself the pander and sycophant of his own and other men's envy and malignity.—*Coleridge from Erasmus.*

Idleness is the parent of future remorse.

# For the Ladies.

Written for Moore's Rural New-Yorker.

### COME LOVE TO ME.

Come love to me!—At twilight's hour
I'll welcome thee within my bower;
Or at the morning's early dawn,
I'll rise to meet thee on the lawn;
Or should the noon-day sun have come,
I'll greet thee in my cottage home,—
And bid thee rest from toil and care
And all my future pleasures share.

Where'er the time, where'er we've met,
Be sure the tryst I'll ne'er forget—
Beneath the moon-light's silv'ry beam,
Beside the river's murm'ring stream—
Down in the green wood's shady lot,
Or to our own lone favor'd grot,
Where last beneath the forest tree
I sang a sad farewell to thee.

Then dear one come, oh come to me,
And I will share my love with thee—
But name the time, but tell me where
And I will haste to meet thee there.
I tire of time so drear and lone,
I long to hear thy gentle tone—
Come dwell with me and I will be
Thine own o'er life's tempest'ous sea.

Rochester, N. Y. A——E.

### THE DEATH OF THE YOUNG.*

Bright as the dew-drops, and swiftly passing as they; fair as the summer-cloud, yet ever fading, is the life and the tarrying time of the gifted and the pure, who linger like an angel's presence, amid the din and darkening scenes of earth. Scattered over the world, far and near, are these gentle spirits. No spot upon it so dreary but *there* is a soul with kindly feelings, and noble impulses. No waste so wild and desolate, but these beautiful *heart-angels* are there, rising above the troubled darkness, and shedding light on the shrouded way of grief and guilt; and dispensing joy on the path of the lonely and sorrow-stricken one. Lovely as the first star of evening, coming forth from their misty hiding-place to dispel the gathering gloom of night, do these arise in the moral heavens, and lighten up with their pure beauty the deep shadows in the heart of man—the grim blackness of iniquity and sin.

A bright star has "faded into the light of a clearer day;" a pure spirit has "gone home." Another has departed from that circle of warm and trusting hearts. Silence sits on the lips of Love; and Death has borne away to the place where *all* are tending, and to that rest which the wearied footsteps of anguish are seeking, one in whose ear a voice of melody was ringing, as the breath of Hope swept the spirit harp now shattered and broken.

"There is weeping on earth for the dead,"

but a new song of praise is heard in Paradise, and his hand wakes the lyre of the seraph.

He passed not away in darkness—he slumbers not beneath the earthy clod—he sleeps not under the green canopy of the grave, but far beyond the circling skies, on the lofty battlements of Heaven, or wandering in its golden light, and gazing on the unveiled glory of the Eternal, is he who departed, while his heart was unsullied by guilt, and his eye undimed by the tears of bitter agony.

It is saddening to the soul to watch the trembling steps of age descending to the tomb. It is anguish to hear the clod rattle the last knell of the hoary sage, whose head is crowned with gray hair, and whose heart is the dwelling place of wisdom and experience. But alas! for the young.—Alas! alas! for the light quenched in its rising splendor, and the storms that wildly crush earth's bud of promise—leaving it barren and desolate.

The beauty of childhood had faded into the brightness of youth, and the sunshine of Hope lay scattered around our young friend, like the beams of the morning; but those earthly aspirations are buried in the grave, the charnel-house of many a sparkling gem of thought and beauty; and that light has been hidden by the dark wing of Death.

Gone, but not forgotten—departed, yet not unremembered. Far from the home he loved, and the friends he cherished, the icy finger of the heart-chilling monster, was laid on the lips *now* hushed and silent, but once vocal with the kindly word to cheer the path of the sorrowing, and lighten the burden of the weary spirit.

But he has gone—and those that sit around the desolated hearth-stone, bereft of one jewel, must wait in vain for the sound of his footsteps, and welcome voice. Earth will know him never more! But *another* spirit, purified and washed in the blood of its Redeemer, bends before the throne of God. Another is added to that innumerable multitude, who cry, "Holy, holy, holy, art thou, O Lord, most high!"

Albion, N. Y., 1853.

* Died, in St. Louis, Mo., Dec. 28, 1853, Francis N. Cady, of Yates, Orleans Co., N Y., in the 22d year of his age.

The shortest life is long enough, if it leads to a better one.

### WHAT LOVE WILL ACCOMPLISH.

"This will never do," said little Mrs. Kitty; "how I came to be such a simpleton as to get married before I knew how to keep house, is more and more of an astonisher to me. I *can* learn, and I *will!* There's Bridget told me yesterday there wasn't time to make a pudding before dinner. I had my private suspicions she was imposing upon me, though I didn't know enough about it to contradict her. The truth is, I'm no more mistress of this house than I am of the Grand Seraglio. Bridget knows it, too; and there's Harry (how hot it makes my cheeks to think of it!) couldn't find an eatable thing on the dinner-table yesterday. He loves me too well to say any thing, but he had such an ugly frown on his face when he lit his cigar and went off to his office.—Oh, I see how it is:

"One must eat in matrimony,
And love is neither bread nor honey;
And so, you understand."

"What on earth sent you over here in this dismal rain?" said Kitty's neighbor, Mrs. Green. "Just look at your gaiters."

"Oh, never mind gaiters," said Kitty, untying her "rigolotte," and throwing herself on the sofa. "I don't know any more about cooking than a six weeks' kitten; Bridget walks over my head with the most perfct Irish nonchalance; Harry looks as solemn as an ordained bishop; the days grow short, the bills grow long, and I'm the most miserable little Kitty that ever mewed. Do have pity on me, and initiate me into the mysteries of broiling, baking and roasting; take me into your kitchen now, and let me go into it while the fit is on me. I feel as though I could roast Chanticleer and all his hen-harems."

"You don't expect to take your degree in one forenoon!" said Mrs, Green, laughing immoderately.

"Not a bit of it! I intend to come every morning, if the world don't whirl off its axle. I've locked up my guitar and my French and Italian books, and that irresistible "Festus," and nerved myself like a female martyr, to look a gridiron in the face without flinching. Come, put down that embroidery, there's a good Samaritan, and descend with me into the lower regions, before my enthusiasm gets a shower-bath;" and she rolled up her sleeves from her round white arms, took off her rings, and tucked her curls behind her ears.

Very patiently did Mrs. Kitty keep her resolution; each day added a little to her store of culinary wisdom. What if she did flavor her first custards with peppermint instead of lemon? what if she did 'baste' a turkey with saleratus instead of salt? what if she did season the stuffing with ground cinnamon instead of pepper? Rome wasn't built in a day—cooks can't be manufactured in a minute.

Kitty's husband had been gone just a month. He was expected home that very day. All the morning the little wife had been getting up a congratulatory dinner, in honor of the occasion. What with satisfaction and the kitchen fire, her cheeks glowed like a milkmaid's. How her eyes sparkled, and what a pretty little triumphant toss she gave her head, when that big trunk was dumped down in the entry? It isn't a bad thing, sometimes, to have a secret even from one's own husband.

"On my word, Kitty," said Harry, holding her off at arm's length, "you look most provokingly well-to-do' for a widow 'pro tem,' I don't believe you have mourned for me the breath of a sigh. What have you been about? who has been here? and what mine of fun is to be prophesied from that merry twinkle in the corner of your eye? Any body hid in the closet or cupboard? Have you drawn a prize in the lottery?"

"Not since I married you," said Mrs. Kitty: "and you are quite welcome to that sugar-plum to sweeten your dinner."

"How Bridget has improved," said Harry, as he plied his knife and fork industriously: "I never saw these woodcock outdone, even at our bachelor club rooms at —— House. She shall have a present of a pewter cross, as sure as her name is McFlanigan, besides absolution for all the detestable messes she used to concoct with her Catholic fingers."

"Let me out! let me out!" said a stifled voice from the closet: "you can't expect a woman to keep a secret for ever."

"What on earth do you mean, Mrs. Green?" said Harry, gaily shaking her hand.

"Why, you see 'Bridget has improved;' *i. e.* to say, little Mrs. Kitty there received from my hands yesterday a diploma, certifying her Mistress of Arts, Hearts and Drumsticks, having spent every morning of your absence in perfecting herself as a housekeeper. There now, don't drop on your knees to her till I have gone, I know very well when three are a crowd, or, to speak more fashionably, when I am '*de trop*,' and I'm only going to stop long enough to remind you that there are some *wives* left in the world, and that Kitty is one of 'em."

And now, dear reader, if you doubt whether Mrs. Kitty was rewarded for all her trouble, you'd better take a peep into that parlor, and while you are looking, let me whisper a word in your ear confidentially. You may be as beautiful as Venus, and as talented as Madame de Stael, but you never'll reign supreme in your liege lord's affections, till you can roast a turkey. —*Olive Branch.*

Friendship is more firmly secured by lenity towards failings, than by attachment to excellences. The former is valued as kindness which cannot be explained, the latter is exacted as payment of a debt to merit.

The young fancy their follies are mistaken by the old, for happiness; while the old fancy that their gravity is mistaken by the young, for wisdom.

MOORE'S RURAL NEW-YORKER.

ROCHESTER, MAY 21, 1853.

PUBLISHER'S NOTICES.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW-YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ OUR *lowest* club price is $1,25 for any number of copies over 20—and $1,50 under that number, unless a full club of twenty is ordered.

☞ ADVERTISEMENTS must be brief, appropriate to the objects of the paper, and accompanied with the cash.

ADDITIONS TO CLUBS—Are still in order. Having but few back numbers, agents and others can order additions to Clubs at $1 per copy from 1st of March or April to end of the year and volume. New Clubs, or single subscribers, can begin 1st March, April, or May, as preferred.

## The Season and the Crops.

THE season is quite backward. Until the present week the weather has been unusually cool and wet, though generally favorable for the wheat crop, fruit, &c. In this region, particularly, overcoats continued in demand until the middle of May, up to which period we had scarcely a warm day, and no settled, sunshiny weather. Since Saturday last, however, there has been a decided improvement; the sun has been visible some ten or twelve hours a day, and reflected a most genial heat—which, together with occasional showers, hath hastened vegetation of all kinds, and materially aided the husbandman. This is the first warm and comfortable week of the season, whereat mankind rejoiceth, and Nature is radiant with life and beauty.

So far as we are informed the wheat crop of Western New York has passed the winter and spring without material injury, and generally has a promising appearance. Our advices, per papers and letters, are also favorable in regard to the crop in other sections and States, with the exception of localities not well adapted to its growth, or where a failure is not unfrequent. Yet, the crop is subject to so many contingencies between this and harvest time, that no great reliance can be placed upon statements made so early in the season.—The most that can be safely said, is, that the crop looks well at present, promising, extraordinaries excepted, a good yield. The same remark will apply to most kinds of fruit grown in this region, so far as we have observed or are advised.

## Merit Unappreciated.

AN article in a late number of the *N. Y. Tribune*, entitled "Agriculture Advancing" calls forth a vengeful reply from the associate editor of the *Daily American* of this city—Dr. LEE,—who is also the principal editor of the Southern (Ga.) Cultivator, and proprietor and chief editor of the Genesee Farmer. The *Tribune's* article makes no pretensions to science or profundity, but cites certain facts, and commends several agricultural journals—*omitting mention of the two above named.*—To this omission may, possibly, be attributed our neighbor's tirade—wherein the *Tribune* and its editor are stigmatized with such elegant phrases as "humbug," "ridiculous parade," "ambitious organ of abolitionism," "leadership of the abolitionists," and similar profoundly logical appelatives. The Dr. ought to be more grateful, in remembrance of the fact that the *Tribune* not long since gratuitously published a "first rate notice" of one of *his* journals—a "puff" of the Southern Cultivator, *written by its editor* (the Dr.) for the Patent Office Report, but excluded by the Commissioner! From the talk about 'abolition"—the condemnation of flax culture, and proclivity to cotton—in our neighbor's article, we conclude it was written for his Southern paper, and published in the *American* by mistake! We notice, however, that Mr. GREELEY'S paper has not yet been discontinued, and it will probably survive this powerful demonstration.

Unfortunately for their future prosperity, all the journals favorably noticed by the *Tribune* are condemned by a stroke of the Doctor's pen. But if our neighbor's journals are the only *Simon pures*, how happens it that several of those mentioned by the *Tribune* are rapidly surpassing the former in circulation and influence? Is it because the reading classes are so lamentably ignorant that they cannot appreciate merit?—or is it possible that the Dr., instead of "the rest of mankind," is at fault and a trifle superannuated?—Of course our neighbor's nerves and opinions are not affected by the fact that several of the papers named by the *Tribune*, are rapidly gaining favor and patronage in all sections of the Union, while the circulation of his pet journal—the principal "medium" of the profound theories which are to "save the Nation"—has *decreased* some 25,000 recently!

Lamenting the way in which "the balance of organic nature is destroyed" the Dr. adds that "no adequate remedy is prescribed or even contemplated, by the leading quack or the agricultural journals which the *Tribune* patronizes." In other words, none of these journals teach the Doctor's cotton, potato starch, and other theories; and the probability is that one of them, at least, never will—*though his services have been proffered for that purpose!*

—We have usually avoided any allusion to the Farmer, except when we could speak of it in favorable terms,—but when its editor condemns the RURAL, without argument or reason, because it is commended by the leading newspaper in America, we must recognize the compliment.

## Resources of California.

THE recent Census of California gives much interesting information relative to the Productions and population of that remarkable State. The estimated value of capital employed in Agriculture, Real Estate, and Improvements is $108,522,568; of this amount $17,547,447 is employed in Mining. The Live Stock is valued at $18,903,714, and the Agricultural Products at $6,162,040. Horses last compare with those of the other States as follows:

In horses California is in advance of fifteen of the States; in mules of twenty-six States; milch-cows stock of twenty States barley only equaled by New York; potatoes next to New York and more than one-half of all produced in the Union; wheat greater than ten of the States; oats, three-fourths of the other States: hay, exceeding nine of the States; fruits, exceeding all the States in variety, and one-half of them in quantity produced.

In two years the population has increased thirty per cent., and it is thought that in ten years it will have, at least, quadrupled. There are, as at present estimated, 308,000 inhabitants, the annual increase being thirty-nine per cent. greater than that of the other States. At this rate she will soon become the most populous and wealthy member of the Confederacy.

The history of California is without a parallel. The power of self-government and the energy of the individual man, are here displayed beyond all precedent. Never were such varied elements, so harmonized together before,—never before so completely, were the false distinctions of wealth and caste set aside. The man of work—hard work—in no matter what business or profession—here stands up the peer and equal of the proudest—self-confident and self-sustaining. And, what an energy—a self-re-emperating power—has been displayed in the rebuilding over and over again, almost before the ashes were cold of her burnt towns and cities. How full of new enterprise are her people, planning expeditions to Japan, flocking to Australia, and opening America to the Chinese, and China to the world through the influence of her returning emigrants.

Who shall return to predict the future of California?

## Rochester P. M.—New Candidate.

INASMUCH as President PIERCE is unable to decide among the many Richmonds in the field for the Postmastership of our goodly city, we beg to suggest a new candidate—one whom the people will approve, and to whom politicians and the party democratic, can offer no reasonable objection. As a man every way fit for, and worthy of the office and the honor, we respectfully present our brother of the quill and scissors,—Maj. HIRAM BUMPHREY of the *Daily Advertiser* newspaper.—With all due respect for the able gentlemen whose claims have been presented and urged in the proper quarter, we submit that neither of them is more deserving of the place, power and perquisites to be conferred. And if the President desires to settle, satisfactorily, what has become a "vexed question," the object can be accomplished by the appointment of Maj. B.— for we are confident that nine-tenths of our citizens would rejoice thereat, while a division of "the party" would be avoided. The President will please consider himself memorialized—aye, instructed—on this subject; and if, after proper inquiry, he does not appoint the Major, we shall be constrained to place him among those of whom it is said, that

"They know the right, and they approve it too,
Condemn the wrong, and still the wrong pursue!"

FATAL ACCIDENT.—In Buffalo, on Friday afternoon of last week, a four story granite building, which was being repaired and remodeled, in consequence of the removal of an inside wall, fell in upon the workmen, burying them beneath the ruins. Six persons, have been taken from the ruins, dead, and several others more or less injured.

# Literary Notices.

THE WESTMINSTER REVIEW for April contains an article on "Educational Institutions of the United States," another on "British Philanthrophy and Jamaica Distress," another on "French Policy," another on "Early Christianity."—reviews of "Thackeray's Works," and of "Ruth and Viletta," and the "Cotemporary Literature of Europe and America." The young poetical genius, ALEX. SMITH, is also favorably noticed. New York: L. SCOTT & Co., $3, per annum.

PHELPS' BEE-KEEPER'S CHART; being a Practical Treatise on the Instinct, Habits and Management of the Honey-bee, in all its various branches. By E. W. PHELPS. New York: C. M. SAXTON, 1853.

THIS little pamphlet is put forth as "the results of many years practical experience, to render bee-keeping less difficult, and at the same time more sure, profitable and pleasant, than it has formerly been." The author is the inventor and patentee of the Ohio Combination Bee-Hive.

AN ELEMENTARY TREATISE ON BOOK-KEEPING by Single and Double Entry, designed for Common Schools. By S. W. CRITTENDEN, Accountant. Philadelphia: E. C. & J. BIDDLE, 1853.

THIS is a very valuable little work for the purpose which it is designed to answer, that of initiating the beginner into the art and mystery of keeping Accounts—a most necessary accomplishment to every one.

☞ A correspondent of Fred. Douglas' Paper, says that Rev. Josiah Henson, a colored preacher and fugitive slave, who resides at Dawn, Canada West, is the real Uncle Tom represented in Mrs. Stowe's book.

# Correspondence.

## Incidents of Travel Westward.---No. 2.

*Arrival at Cleveland. Description of the City—high price of City lands, and value of Farming lands near the City—Coal trade of the City; Annual amount used in the Lake regions—An Eastern Tobacconist, Remarks on the culture and use of "the Weed" in the United States.*

CLEVELAND, Ohio, May, 1853.

ON the morning of the 28th, some twelve hours from Buffalo, we arrived in Cleveland. No city west of Boston surpasses this in points of real beauty. It has, at the upper end of Main street, a Park of several acres, covered with small trees; and contains a great number of charming residences, surrounded with ornamental shubbery, lawns and flower gardens. It has five Banks, six Presses, eighteen Churches, five 1st class Hotels, two Medical Colleges,—one Homeopathic, the other Allopathic,—one Marine Hospital, besides a Court House and Jail. In 1840 it contained a population of 6,000, and Ohio City, across the river, 2,000. Now the former has 25,000, and the latter 8,000. Cuyahoga, an Indian term, meaning crooked, is the name of the stream separating these two cities.

—We said Cleveland was decidedly the most beautiful city west of Boston; and we will here add, that in our opinion, (and we think it will not be disputed,) it surpasses in points of artistic beauty, all other cities of the Union! It is elevated some seventy feet above the level of the Lake. The buildings are costly, and erected in the most modern style of architecture. The large number of forest trees that in all parts of the city tower up their beautiful branches, arrayed in the richest foliage, render it a paradise, and has given it the name of the Forest City. The streets are broad, and cross at right angles. On a former occasion, we passed through many of the principal streets, on a warm morning in June, and owing to the vast amount of foliage that overhung our pathway, we were compelled to rank Cleveland far above any other city of the West.

Cleveland is the terminus of no less than five Railways, and one Canal. The site of the "Forest City" Hotel, covering 60 feet front on Main street, about 200 feet on Public Square, was sold six years since on ten years credit, for $10,000. Now exclusive of buildings, its estimated value is no less than $40,000. Lands for farming purposes, within five or six miles of the city, sell readily for $100 per acre; from six to twelve miles distant they range from $30 to $60 the acre.

It is now about ten years since the coal trade of Cleveland began to form an important branch of its business. The use of coal in houses as fuel, is rapidly extending, because it is safer and cheaper, and wood every year is becoming scarcer. But coal is called for chiefly to put machinery in motion, and is fast supplanting every other agent, and all other fuel for that purpose. It is the great motive power of the world for mechanical purposes, and is every day finding new applications.

The coal business cannot be said to have been regular at Cleveland before the year 1833. The average receipts at this port for ten years, from '33 to '43 were 6,270 tons, and from '43 to '53 59,840 tons, annually. At this rate of increase the receipts for 1862 would be more than ten times that of 1852, or more than 1,379,260 tons. From this exhibit, the citizens of Cleveland can easily make an estimate of the future consequences of the coal trade, and its influence upon their local prosperity.

In Ohio, a mine that does not average three feet, or one yard, in thickness, is not considered worthy of being wrought; but in most of the mines, the broken and thin ground, that cannot be wrought, is greater than that where the coal exceeds three feet. An acre yields about 3,200 tons, so that all the coal hitherto brought to Cleveland, has exhausted only about one hundred and eighty acres of actually wrought coal, or about eighteen and two-fifth acres annually. The only other resource for bituminous coal now used to supply the Lake region, is that found in the State of Illinois, the coal of which is delivered at Chicago. The entire consumption of the Lake region is set down annually at 300,000 tons.

Here we met with an Eastern Tobacconist, on his way to Wisconsin, to secure by contract the tobacco crop raised in that State this season. Although tobacco is one of the most exhausting crops, (restoring nothing back to the land,) yet because it pays from $100 to $150 per acre, many farmers in the west are engaged somewhat extensively in its culture. In 1850, New York raised 83,189 lbs. of the weed. Ohio raised the same season, 18,480,967 lbs. No less than 199,532,494 lbs. was raised in the United States in 1850. Cui Bono? That its use is alarmingly on the increase is quite evident, for it is stated on good authority, that the people of the United States annually smoke up the value of all their export of wheat in Spanish cigars. The city of New York alone spends $18,000 daily for cigars, while $8,500 buys her bread, and $5,000 suffices to pay for 100,000 the milk which is daily purchased and consumed in the great metropolis.

"O would some power the giftie gi'e us,
To see ourselves as ithers see us."

S. B. ROCKWELL.

## An Ancient Oak.

LE ROY, N. Y, May, 1853.

EDITOR OF THE RURAL:—Dear Sir,—I have recently been shown a curious relic of antiquity. Mr. PORTER P. DAVIS, of Stone Church, cut down a large white oak tree on the farm of Mr. MARTIN KELSEY—half a mile south of Stone Church, and a mile and half north of Fort Hill, Genesee Co. This tree, probably on account of its majestic beauty, has been spared by the woodman near half a century, and been long known and recognized in the neighborhood by its standing a lone monarch of the field. Mr. DAVIS sawed off several cuts from the butt, and split them into spoke timber. The heart of the butt cut—perfectly sound, and six inches in dimeter—came out by itself; and on it were the strokes of a thin, sharp ax, by which it was girdled all round, when a sapling, but not sufficient to destroy its vitality. (It could not have been done by a tomahawk.) The girdling was made six feet from the ground, and the strokes of the ax sent upward. Over this wound, the tree had grown all round to the thickness of thirteen or fourteen inches—making the tree almost three feet in diameter. And on counting the circles or grains, (which every woodman knows, or may know indicates the true age of the tree,) they amounted to two hundred and sixteen. Query—who did it?

S. PIERSON.

## American Bible Society.

THE thirty-seventh annual meeting of this Society was held on the 12th inst., at Metropolitan Hall, in New York city. The attendance was very large, and attentive. The past year has been one of much prosperity—one in which more has been accomplished than in any previous year. Still better things are hoped of the present year, as the completion of the new publishing house gives increased facilities for this part of the work. But the Biblical wants of the world still go far beyond the pecuniary resources of the Society. The reports present the following statement:

Sixty-five life directors, and 1,318 life members have been constituted during the year. Sixty-seven new auxiliary societies have been formed, most of them in the new States and Territories.

The entire receipts of the past year have been $346,542 62, an increase of $37,797 61 over those of the previous year. The number of bibles and Testaments issued has been 799,370, being an increase of 133,355 copies over the issues of the previous year, and making an aggregate of 9,088,352 since the formation of the Society. Of these issues of the year, 63,772 have been donations, and very many others sold, to be paid for when re-sold by the auxiliaries.

Thirty-two agents have been in service, two of whom, Rev. Dr. Bond, of Missouri, and Rev. Mr. Pollock, of Alabama, have died much lamented.

Of the books sent forth, more or less have gone to every State and Territory, to the West Indies, to Brazil, to all the Republics of Spanish America, to Turkey, India, China and to several Islands of the Pacific.

Grants of money have been make towards printing and circulating the Scriptures in France and Russia, and at twelve foreign missionary stations to the amount of $24,000.

—The new building of the American Bible Society covers three-quarters of an acre. It is six stories high, and occupies the whole block between Third and Fourth Avenues, Astor Place and Ninth street. It has a front of seven hundred feet, and depth of fifty, with a court yard in the centre—The paper is so delivered at a door in Ninth st., on the lower floor, and to be carried up by degrees, passing through the different stages of the work until it arrives in books at the depository in the sixth story. Of all the gigantic manufactories that have been erected in New York during the last year, this is the only one that will have no rivals and make no money. Yet its products will be exported all over the world, and outlast those of all the rest.

RELIGIOUS AND CHARITABLE.—The financial importance of some of the Associations that have been holding anniversaries in New York city, is worth noticing. Thus the receipts the year past of the

GREAT LUMBER BUSINESS.—Chicago is decidedly the lumber city of the Lakes. An immense country is furnished with lumber from that point, and the fine lumber regions about the lower end of Lake Michigan and Green Bay yield a liberal supply. The *Tribune* notices the arrival one day last week, of seventeen vessels loaded with lumber from Grand River, Two Rivers, St. Joseph, &c., with over 900,000 feet of lumber, 2,675,000 shingles, two large masts, and a deck load of timber.

☞ Judge Stoddard, a venerable and prominent citizen of Cleveland, died on the 8th inst., aged 86. He was born in Northampton, Mass.—was personally known to Gen. Washington, and was a member of the original Connecticut Land Company, of which Samuel Mather, Esq., of Conn., is now the sole survivor.

☞ The latest news from China is highly important. The insurgent army had taken the city of Nankin and were in full possession of it. So serious had the aspect of affairs become that the throne of his Celestial Majesty was considered to be tottering, and that it could only be sustained by the armed intervention of the European powers.

☞ The whole number of deaths ascertained to have resulted from the catastrophe at Norwalk is forty-five. Of this number, nine resided in N. York city, five in other parts of the State, and 24 in New England. There are included two clergymen, 8 physicians, 16 women and 2 children.

☞ The total arrivals of passengers at San Francisco, from the 1st of January to the 1st of April, were 10,203, and the total departures during the same period 9,256. So the State has gained but about 1,000 inhabitants by emigration during three months.

☞ There are nearly five hundred prisoners in the two Penitentiaries of Pennsylvania. In the Western Institution the labor of the convicts has covered the cost of their substance during the year, and has paid four-fifths of the salaries of the officers.

☞ Within twenty miles of Buenos Ayres, a farmer bought, last year, eight thousand fat sheep at *eighteen pence per dozen.* Indeed, mutton is so plentiful in that country, that hogs are fattened upon it.

# News Brebities.

—— Martin Van Buren has taken passage for Europe.

—— There is an unmarried young lady in Boston who is taxed for $320,000.

—— The wheat crop through the whole valley of Virginia, is said to be very promising.

—— There are $14,000,000 in the Sub-Treasury vaults of New York, Boston and Philadelphia.

—— The formal opening of the Ohio and Pennsylvania Road, took place on Monday the 16th.

—— The late Amos Lawrence gave to Williams College, at different times, the sum of $40,000.

—— A Church for Father Gavazzi, the Italian patriot, is about to be erected in the city of New York.

—— "Those intolerable nuisances" called runners, have been discontinued by the Cleveland Hotels.

—— Oberlin College has 835 students, of whom 378 are females. It is in a highly flourishing condition.

—— Dr. Cook, well known as a surgeon in the last war, died at Portsmouth, Va., on Monday of last week.

—— Major Thomas Stevens, a soldier in the Revolution, died in Brooksville, Me., on the 7th inst., aged 90 years.

—— It was thought that all of the legatees of Napoleon the First would prosecute their claims before the tribunals.

—— Twenty-seven thousand emigrants embarked at Liverpool for America and Australia during the month of April.

——A new Bank, with a capital of $1,000,000, is about being established in New Orleans, under the new Free Banking law.

——Within about year, eight steamers, valued at nearly a million and a quarter of dollars, have been lost on the Pacific coast.

—— It is said that the United States revenue from all sources, the present year, will amount to at least sixty millions of dollars.

—— It is stated as a fact, that sixteen acres of land in the Bowery, N. Y., were once sold for one fat chicken a year during the seller's life.

——A new Masonic Hall is about to be erected in Philadelphia, at an expense of $100,000. The front is to be of brown stone, and to cost $20,000.

—— Large discoveries of copper are said to have been made on the estates of Ex-Governor Thomas and Peter Heins, in Allegany county, Maryland.

—— Nine head of cattle from Cuyahoga Co., Ohio, were sold at Buffalo recently, for $5,000.—They are to be sent to the New York World's Fair.

—— The London Times circulates 20,000 copies daily, according to the information obtained from the pressman. The number has been stated at 40,000.

—— Canal business has been very active this month. On the 13th more boats were weighed at the Lock in this city, than ever on one day before.

—— The late disaster at Buffalo, is quite up to the mark of the times. We hear of "appalling catastrophes" every day. Human life is at a discount.

—— The English census in 1851, gives 20,400 places of worship not belonging to the Established Church. Those belonging to the Establishment about 14,000.

—— A blind book dealer from Cincinnati, attended the recent trade sale at New York, and proved himself a better judge of books than any dealer present.

—— Judge Thomas, an old and well known citizen of the West, in a fit of insanity, committed suicide at his residence at Mt. Vernon, O., a few days since.

—— The State of Maryland has recently paid to the captors of Chaplin, charged with the abduction of slaves, $1,150, distributing the sum among a dozen persons.

—— The Irish in the United States, and their poorer friends in the United Kingdom, produce, it is said, one-half the correspondence carried on by the two nations.

—— A sturgeon weighing 101 pounds was shot at Milwaukee. It had come up in pursuit of minnows, nearly two quarts of which fish were found in its stomach.

—— The Dr. Dwight who was killed at Norwalk, had been a resident of Moscow, Livingston county, N. Y., for thirty years. He was an estimable citizen, 52 years of age.

—— A boy sixteen years of age, died in New York city a few days since of hydrophobia—or what was supposed to be hydrophobia—caused by the bite of a dog four years ago.

—— There is a venerable Pear tree in N. York at the corner of 13th st. and 3d avenue, called the "Stuyversant Pear Tree," which is said to be 230 years old, and is now in bloom.

—— The Bonds and Mortgages of the Farmer's Bank of Onondaga, representing Stock to the amount of $50,317, were recently sold at auction, and brought but $13,505. Poor security, that!

—— The sale of Canal lands in Illinois commenced on the 10th. Prairie land brought from $4 to $5 per acre, and timbered $8 to 16, being an average of 70 per cent. above the appraisement.

—— No fewer than 1,500 shad were brought from Hanford to Springfield, Mass., on the 5th inst., many being engaged at that place, and others bound for points to the north-east and west.

—— The Board of Trustees of the village of Owego have resolved that no licenses for the sale of intoxicating drinks shall be granted. So all public houses within the corporation have closed their bars.

—— Henry S. Fitch, of San Francisco, offers a prize of $10,000 for the most comprehensive treatise upon the construction of a Railroad from the Atlantic to the Pacific ocean, together with collateral subjects.

—— The New York Sunday School Union held their annual meeting on Tuesday, the 10th inst., on which occasion nearly 20,000 children were assembled at different places, and addressed by able speakers.

——A great tornado passed over the lower part of Princess Anne county, Virginia, May 10th. A number of houses were swept off, and everything was prostrated. Four lives were lost, and many persons wounded.

—— A bill has been reported by a Committee of the Canadian Parliament to close the Canals, Post Offices, &c., on the Sabbath. There are a great many petitions for the measure, and no remonstrances against it.

—— The Directors of the New York and New Haven Railroad have published a statement respecting the Norwalk disaster, in which they impute the whole blame to the engineer. But the public will scarcely agree with them.

# Foreign Intelligence.

### Arrival of the Atlantic.

The Steamship Atlantic opened the season of rapid passages across the ocean, by arriving at New York on the 14th inst. in 9 days 23 hours from Liverpool. We venture to say that this speed will not be beaten much this year.

The Jew bill has been defeated in the House of Lords. Lord Palmerston has been overhauled in the Commons for his share in the rocket factory business, and came off decidedly second best in the discussion. Mrs. Stowe has been entertained at a dinner by the Lord Mayor of London, and is now the guest of the Duchess of Sutherland.

The report of an accident to the French Empress is officially confirmed.

In Russia, a bill to exclude Jews from all public employments has passed one House and is causing an excitement in the country.

No special news from the negotiations at Constantinople. A religious fight has taken place at the Church of the Holy Sepulchre at Jerusalem, and the English missionaries were turned out of it. it.

From the African coast we hear that the slave trade is nearly extinguished.

The advices from Australia are satisfactory.

Markets.—Transactions in Breadstuffs unimportant.

Flour declined 3 1 to 6d. Wheat declined 1d. Yellow Corn unchanged. White declined 6d @ 1s. No Transactions were reported.

Bacon moved off at full rates. More doing in beef. Pork at irregular rates.

Lard tending upwards. Tallow active.

Clover seed nominal.

# News Paragraphs.

☞ The Providence Post gives a decision of the Massachusetts Supreme Court, in the case of an action against the Dorchester and Milton Bank. The suit was brought to recover the value of a $50 bill, which the bank alleged to have been stolen, and there upon refused payment. The Court said that, in the case of stolen promissory notes and bills of exchange, the party seeking payment for them must prove that he paid value for them, or came honestly by them; but in the case of stolen bank bills, the burden of proof is on the other party, and the defendants, to avoid payment, must show that the plaintiffs did not come honestly by them. If this is a good law, the decision should be generally known.

☞ A block of fine white marble, 6 feet long by two and a half feet wide, has just been finished in Washington for the National Washington Monument. An open Bible in alto-relief is displayed on the centre, with the words, in raised letters on each side of it, "The General Assembly of the Presbyterian Church in the U. States of America, in session at Washington City, May, 1852." The Assembly made a liberal appropriation for this stone, the design of which was furnished in a resolution passed by that body.

☞ Mr. Bryant, Editor of the New York Evening Post, who is traveling in the East, writes that "the ancient bigotry of the Moslems is fast relaxing. Not only do the Turks get drunk like Christians, of which I was sorry to see some examples on board the Austrian steamer that brought me hither from Beyroot, but they submit to contact with Christians, and do not think themselves, as they once did, contaminated by it; and they suffer our presence in their most holy places."

☞ The *fast* trains on the Hudson River and Central line of Railroads now run from N. York to Buffalo in 14 hours, including half an hour at Utica for dinner. At Buffalo immediate connection is had with the boats for the West and with the Lake Shore Road. The fare on this route has been put down between Albany and Buffalo to $6, so that passengers by boats reach Buffalo from New York at an expense of $6.50, and by Hudson River Railroad at a cost of $7,50.

☞ Professor Sheppard, while in Charlotte, N. C., a few days since, was presented with a diamond, by Dr. Deventhorpe. That gentleman had lately discovered it on his estate at Pioneer Mills, and this is the second specimen of this precious gem found within the year in the country. Hitherto no special search has been made for the diamond, these specimens having been discovered in a manner purely accidental.

☞ The imports of foreign dry goods at New York in April, 1853, amounted to $5,301,014. In April, 1852, $3,825,974. Excess in April of this year, $1,475,930, equal to 39 per cent increase.—The whole excess of the dry goods import at New York, from Jan. 1st, to May 1st, this year, over the same period of 1852, is $11,692,000, or 49 per cent. Truly we are large purchasers, as a people.

☞ Dwight's Journal of Music says:—The City of Milwaukee, in Wisconsin, is in possession of a musical privilege enjoyed at present by no other city in the Union—namely, a German Opera, with full orchestra, chorus and principal singers. And what is more, it is likely to be domesticated there, since the performers are all resident Milwaukians.

☞ The mining accounts, both public and private, from California are very encouraging.—The practical proofs, indeed, are conclusive of a good yield. The packets of the 16th ult., left San Francisco with $2,713,000 in gold on freight, making for April, $4,947,000. The rains and cheap provisions have greatly favored the miners.

☞ The Metropolitan Hotel, N. York, which some were ready to predict would be a stupendous failure on account of its size, has found it necessary to hire three large houses on Broadway, near the hotel, sufficient to afford accommodation for 320 additional guests. The hotel business was never so prosperous as now.

☞ The Railroad Journal says that farmers along the line of the Erie Road have taken the freighting business into their own hands, on invitation of the company. A producer charters a freight car, loads it with produce for the New York market, and attends to its transshipment and sale on reaching the city.

☞ The product of the Lake Superior Copper Mines last year was equal to 2,5000 tons.—This is nearly one-tenth the annual product of the world; Norway 7,200 tons, and Great Britain 14,-650 tons, being the largest producers. Of the yield of Great Britain, 11,000 tons are from the mines of Cornwall alone.

☞ A magnificent block of native copper from the Minnesota Mine has been prepared by the agent, Mr. Roberts, for exhibition in the Crystal Palace. The metal is almost perfectly pure, and its value nearly $1,700. This block is handsomely faced on the four sides, one of which bears a suitable inscription.

☞ Joshua McQueen, a Sergeant in the army of General Washington, died a few days since in Frankfort, Ky., aged 106 years.

☞ The Atlas learns that Rathbone & Co., have received orders for some 500 Albany cooking stoves for the Australian market. The English stoves, on which the Tasmanians have heretofore depended, are heavy, clumsy and costly. They are not easily packed for sea voyage, nor easy for transportation into the interior, nor so handy for backwoodsmen, and dwellers in tents, as the Yankee contrivances.

☞ Judge Stoddard, a venerable and prominent citizen of Cleveland, died on the 8th instant, aged 86. He was born in Northampton. Was personally known to Gen. Washington, and was a member of the original Connecticut Land Company, of which Samuel Mather, Esq., of Conn., is now the sole survivor.

☞ The Quebec Water Company have tried gutta percha pipes with complete success. They bore a pressure of one hundred and five pounds to the square inch, and, the Chronicle says, could apparently have sustained double that pressure. The brass coupling twice gave way, but not the pipes.

☞ Detroit numbers, says the Tribune, 30,000 souls. Cleveland numbers, on both sides of the Flats, 34,000. Buffalo and Chicago only exceed Cleveland in population, says the Forest City, of all the cities on the Lakes. In beauty or prosperity she has no superior on these inland seas.

☞ The receipts of the Bank of England, of Gold from Australia, have been considerable, as the latest returns show an increase of £218,385 in the stock of the precious metals, in face of a considerable demand for coin on the part of the dividend receivers.

☞ The Bonds of the New York Central Rail road (Consolidated) Company will be all issued payable in Federal Currency, none of them in Sterling, as at first talked of. They will have 30 years to run; bear six per cent. interest, payable 1st of May and 1st of Nov., in New York city.

# Deaths.

In this city, on the 15th inst., OWEN MORRIS, aged 45 years.

In this city, on the 15th inst., of congestion of the lungs, THEODORE ROWLAND, aged 22 years.

In Salina, Onondaga Co., N. Y., on the 11th inst, of consumption, BENJ. GUMAER, aged 32 years.

The deceased was a young man of uncommon promise, and had by his kindness of heart, and generous disposition endeared himself to a large circle of friends, who are thus early left to mourn his loss. And to her, who, day and night watched over him with all the devoted tenderness of a sister's love, his loss is indeed irreparable. But he rests in peace, in hope of a better life. B.

THE WOOL GROWER AND STOCK REGISTER:

A MONTHLY JOURNAL

**Devoted to the Wool and Stock Growing Interests.**

VOLUME V,—FOR 1853-4.

THIS is the *only* Journal published in America, primarily devoted to the important and profitable interests of Wool and Stock Growing, etc. It contains a large amount of useful and reliable information on Wool, Stock and kindred subjects, and should be in the hands of

**Every Owner of Domestic Animals!**

Whether located East or West, North or South, for much of the matter given in its pages is equally interesting in all sections of the United States, Canada, &c., and not furnished in any other publication.

The Fifth Volume, commencing July, 1853, will be enlarged by the addition of eight pages to each number, (as a cover, for notices, &c.,—making in all, 24 Large Octavo Pages,) and otherwise improved. Published in the best style, and illustrated with numerous superior engravings: embracing Portraits from life, of Sheep, Cattle, Horses, &c.,—Designs of Farm Buildings, etc. The Reviews of the Wool and Cattle Markets, given in each number alone worth many times the price of the paper, which is

**ONLY 50 CENTS A YEAR!**

Five Copies for $2; Eight for $3; Fourteen for $5; Twenty for $7,—*in advance*. Back vols, bound in paper, at 40 cts. each—in sheets at 35 cents. Premiums offered to those who form clubs. Specimen numbers, &c., sent free.

☞ Now is the time to Subscribe,—as all subscriptions should commence with the volume. Bills of all specie paying banks, and postage stamps, received at par. Money, properly enclosed, at our risk,—if addressed to

D. D. T. MOORE, Rochester, N. Y.

During the past four months the undersigned has given in cash and other premiums, *over* ONE THOUSAND DOLLARS to persons who have generously exerted themselves in extending the circulation of the Rural New-Yorker,—and now invites the attention of Post-Masters, Agents, Subscribers, and others disposed to aid the Wool Grower and Stock Register to the following list of

**LIBERAL PREMIUMS!**

1st. TWENTY DOLLARS, IN CASH, to the person who shall send us the greatest number of subscribers to The Wool Grower and Stock Register previous to the 1st of November next, remitting payment according to our club terms, as given below.

2d. FIFTEEN DOLLARS, in Agricultural Books, (or extra copies or back volumes of our journals, if preferred,) to the person who shall send us the second greatest number, as above specified.

3d. TEN DOLLARS, in Books or Papers, as above, to the person sending the next (third) greatest number.

4th. EIGHT DOLLARS, in Books or Papers, to the person sending the next (fourth) greatest number, as above.

5th. FIVE DOLLARS, in Books or Papers, to the person sending the next (fifth) greatest number, as above.

6th. THREE DOLLARS, in Books or Papers, to *each* of the Five persons sending the next (6th, 7th, 8th, 9th, and 10th) greatest numbers as above.

7th TWO DOLLARS to *each* of the Ten persons sending the next (11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, and 20th,) greatest numbers as above.

☞ That Post-Masters, Local Agents and Subscribers, wherever the W. G. & S. R. circulates, may have a fair and equal chance to obtain the Premiums, *traveling agents, post-riders, &c.*, are not included in the offer.

SPECIFIC PREMIUMS.

In order to reward *every one* who may send, as agent or for himself, one dollar or more on subscription to the W. G. & S. R., we offer to those who do not compete for the preceding prizes, the following liberal gratuities:

1st. To every person sending $1 for two copies of the W. G. & S. R., we will forward by mail a volume of the Genesee Farmer, (bound in colored paper) for either 1848 or '49 as preferred.

2d. to every one sending $2 for five copies,—or $3 for eight,—we will send either one of the three first volumes of the Wool Grower, well bound in handsome colored paper, or one of the vols. of the Farmer above named, as preferred.

3d. To every person remitting $5 for 14 copies—or $7 for 20 copies—we will send an extra copy of the fifth and either one of the preceding volumes—*or* two copies of any previous volume—*or* three vols. Farmer above named—*or* the Rural New-Yorker for six months. And we will pay like premiums, in the same proportion, for any additional number of subscribers.

☞ Back volumes of the W. G. & S. R., bound in colored paper, will be furnished to competitors at the same rate as copies of the fifth volume—and copies counted in making out their premiums.

Competitors for Specific Premiums will please specify what they want in letters containing remittances—when the volumes will be immediately forwarded.

☞ All competitors for Regular or Specific Premiums must comply with the following

**Terms, in Advance:**

Single Copy, 50 Cents a Year; Five copies for $2; Eight for $3; Fourteen for $5; Twenty for $7, and any additional number at the same rate—35 cents per copy. Back volumes, bound in paper, at same prices.

☞ Bills of all specie-paying banks, and postage stamps, received at par. Subscription money, properly enclosed, may be mailed at our risk, if addressed to

D. D. T. MOORE, Rochester, N. Y.

# Market Intelligence.

Rural New-Yorker Office,
Rochester, May 18, 1853.

For the week just closed, the weather has been warm and spring like, contrasting favorably with the cold wet backward spring weather, that has prevailed. Farmers have been prevented from doing their usual spring labor, and are now very busy, embracing the favorable weather for "seed time," and as a consequence very little produce is marketed. The street supply has been small, and as the same is true in all Western New York villages, the supplies coming forward by canal are quite meager.

Flour—The demand for this staple is good, with a firm market. Transactions are confined to small parcels to the retail trade, and purchases from county mills. $4,75@5,25 will embrace the range of prices, except for a few extra brands.

Grain—Wheat is offered sparingly, and readily commands $1,15. The market exhibits much firmness, and an advance may be expected. It is probable more would now be paid for a choice sample in large quantities.

Corn—There is a fair demand for home milling, at 58@60c. for prime yellow. Oats—The market is nearly bare, and buyers very much in want for home consumption.—In the street 45@46c are readily paid, without increasing the amount coming forward. We learn of no sales of Barley.

Seeds—Clover is little sought for, and prices are only nominal. Of Timothy the supply is fair, which the late seeding brings into demand. Sales are made at $2,25, 2,-75@3, as per quality.

Potatoes—The supply is very large. One house has been buying for New York market, choice White Mercers at 25c; the range is 25@37½c, except for some choice varieties for planting.

Apples—The market is rather bare of good Apples.—Russets are about the only kind offered. They command $1,50@2. Northern Spy's would sell for more.

Market Supplies.—There has been little change since last week. Beef cattle, fresh Pork, Veal and Mutton, are not readily obtained, except at good prices. Lambs are much sought for and sell at $1,50@1,75, and very choice would bring $2.

Provisions—We have little change to note in the provision market. Supplies are equal to the demand. Pork, hams, shoulders, &c., are without material change in prices. Butter comes forward to some extent; best new, commands readily 15c; 13@15c is about the range. Eggs 10c.

Hay—Moderate supply. It is somewhat affected by the price of oats and mill feed, and good loads readily sell at our highest figures. We recommend a good straw cutter as a saving clause in times of high prices.

Hogs—We observed quite a number of hogs, offered for sale on the bridge, and from all we could learn, they are in demand at 4@5c. live weight, though principally sold on the scale of offer and take.

Cows and Calves—The market was poorly supplied with still poorer specimens, offered for sale, we should judge, in the hope of enlisting the sympathies of the charitable. Heard no prices named as obtainable.

Horses—Quite a number of good horses are changing hands every day, and at good prices too. A fine large grey from Alabama, Genesee Co., sold for over $150. There are buyers for all good team or carriage horses, at fair rates. A large share of the trade appears to centre at Spencer's Exchange Hotel, Buffalo street.

**Rochester Wholesale Prices.**

## NEW YORK MARKET.

NEW YORK, May 16.

FLOUR—Sales Western Canal 3,800 bbls, at $4.55 for State; $4,75@4 for common to good Ohio and Michigan. Rye flour quiet, $3,87@4 for fine. Corn meal scarce.—Jersey firm, $3,06@12.

GRAIN—A good demand and firm market for wheat.—Sales 7,500 bu red Ohio, slightly mixed, 110c; 5,000 bush white Michigan 120c; 5,000 bu white Canadian 115c; 1,400 bu red Genesee 110c. Rye is better. Sales 2,500 bu, at 90c, part in the ship. Barley firm. Sales 500 bu fair two rowed, 62c. Oats are better and in demand, 47@49½c for State and Western: 45@46½c for Jersey. Corn firmer. Yellow Jersey and Southern scarce, 70c. Sales 21,000 bu at 61@62c for unsound and New Orleans; 63@64½c for mixed Southern; 67c for Western mixed; 64@65½c for white Southern.

PROVISIONS—Pork market unsettled and dull, at $15,-87@50 for Western mess; $13@13,25 for prime.

LARD is less firm and quiet, 9½@10c.

BUTTER comes in freely and is selling, 12@15c for Ohio; 15@19c for new State.

CHEESE dull, 8@9c for new.

STOCKS—Better but not active. Money in good demand, 6@7 ₱ cent.

## ALBANY MARKET.

Albany, May 16—Western products continue to come forward steadily. The receipts of grain thus far have been quite meager, and of flour they have been exceedingly moderate, and not equal to the demand.

Flour, &c.—We notice a good degree of firmness exhibited on the part of holders of Western and State flour, with a moderate inquiry. The home and river demand is light. Sales at 4,50@4,62 for State; 4,62@4,87 for Michigan, Ohio and Indiana; 4,87@5,37 for fancy Genesee and extra Western; and 5,50@5,87 for extra Genesee. But little, however, can be had at our inside figures. Corn Meal is saleable at 1,31.

Grain—There is a good local and eastern inquiry for wheat, with none offering except to arrive. Corn is very scarce and wanted for the supply of the local and eastern trade. For a cargo of old Western yellow 67 was bid and refused. Barley is in good request, and the market is steady. Sales at 71@72 for four rowed. Oats are not plenty, and in active demand at very full prices. Sales at 48.

Provisions.—There is a moderate business doing in Pork and Beef at former rates. Cut meats are in good request at 7@7¼ for smoked Shoulders, and 11@11½ for do. Hams. Lard is steady at 10@10½c. Butter is without material change, but inferior is plenty. Sales of Western at 9@12c, and State at 15@18c. Cheese is selling at 8@10c for new and old.

Feed.—There is no change to notice. Sales 1,600 bus. fine middlings at $1 per 100 lbs.

Hay.—A moderate demand for pressed at 75@90c.

Malt.—Barley Malt is quite firm and in good request with sales at 9 c.

## BUFFALO MARKET.

Buffalo, May 16.—Flour—Ohio and Indiana 4,25, and common to good Michigan 4,12½@4,25@4,50.

Grain—Wheat dull and very little in market. We hear of no sales. Corn in moderate demand and market firm for prime samples, which are scarce. Illinois river 53c, Milan the same and 2500 bus. at 52c. Oats dull with but little inquiry. Sales in small parcels for retail at 10@12c.

Provisions—Mess Pork quiet at $15 for first quality with small sales. Smoked meats in fair demand, with sales of Hams and Shoulders at 9¾ and 6¾.

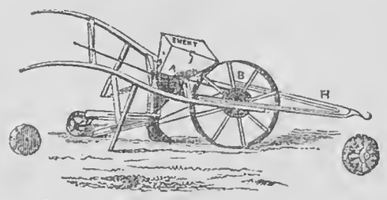
*HALLOCK'S*

**AG'L WAREHOUSE AND SEED STORE.**

*No. 24 Exchange St., Rochester, N. Y.*



[Emery's Corn Planter and Seed Drill.]

THE subscriber, late from the Establishment of Emery & Co., Manufacturers at Albany, where he has been engaged for the past six years, has been appointed their Sole Agent in Rochester and Western New York, for the sale of

*Emery's Celebrated Railroad Horse Powers and Threshing Machines; Circular and Cross-cut Saw Mills, Feed Mills, Corn-stalk and Hay-Cutters, &c.,*

adapted to the Power, and now offers them at manufacturer's prices, with the transportation added, and subject to the warrantee, as follows:—"To work to the satisfaction of purchasers as represented in Circulars and Catalogues, or to be returned within three months, and full purchase money to be refunded." The attention of Farmers is solicited, and a careful investigation into the construction of this Power, and its comparative merits, as well as price requested, before purchasing elsewhere. He is also agent for their

**Combined Reaper and Mower.**

and keeps constantly on hand, Plows, Hay Cutters, Corn Shellers, Seed Planters, &c., &c., comprising a complete and extensive stock of Agricultural and Horticultural Implements generally, together with a full assortment of Field and Garden Seeds, of the best Imported and Shaker growth.

He is also agent for the sale of Seymour and Morgan's New York Reaper, Pierpont Seymour's Grain Drills and Broad-cast Sowers, Wheel Cultivators, Gang Plows, Clover Hullers, Cider Mills, Clover Gatherers, Horse Rakes, Scythes and Snaths, Hand Rakes, Grind Stones, &c.

He will be prepared to furnish dealers with Dunn and Taylor's well-known Scythes; also Manure, Straw, and Hay Forks, Snaths, Rifles, and other buying tools at manufacturers' prices, wholesale and retail.

Particular attention is called to a New Plow, which is believed to be the best cast iron Plow ever offered, and which is warranted to do better work, with less expense of team, than any Plow heretofore sold in Rochester—while the price is less than any other equally well finished

The "uniform one-price cash system" will be adopted, with prices as low as the cost of articles, and just compensation for labor and time, will allow.

Farmers and others are invited to call and examine the stock of Machines and Implements, and are assured no effort shall be wanting to meet promptly the wants of a discriminating public.

☞ Circulars and Catalogues furnished gratis on application personally or by mail. E. D. HALLOCK,
177tf No. 24 Exchange st., Rochester.

**FODDER MAY BE SHORT!**—So plant an acre or so of Carrots, Ruta bagas, Beets, and Swede's Turnips. Don't get the back-ache doing it, but use the New Hand Seed Drill, got up and sold (with the seeds for planting) at HALLOCK'S,
177tf 24 Exchange st., Rochester.

**WHEN CORN'S PLANTED, WEEDS BEGIN TO START.**—Get a good Cultivator, made to expand or contract to suit the times. They are death on weeds; and without elbow grease, will keep the soil mellow, and fill the crib in Autumn. Sold at
177tf HALLOCK'S 24 Exchange st., Rochester.

**LOOK AT A NEW PLOW,** the cheapest and best Cast Iron Plow in market, doing thorough work and of draft that takes the strain, "as easy as a small sin sits on a rich man's conscience." Call, examine, compare prices, and then you'll buy at HALLOCK'S,
177tf 24 Exchange st., Rochester.

Breeders of Improved Stock, and all who have Domestic Animals for sale, will find the Wool Grower and Stock Register the best medium of communication with those most interested in Sheep, Cattle, Horses, Swine, Poultry, &c. It is published monthly—is the only American journal devoted primarily to Wool and Stock Growing, and kindred matters—and has a general and increasing circulation throughout the Union. On the 1st of July ensuing, a cover of 8 pages will be added to the work, when the publisher will be enabled to accommodate advertisers, whose favors have heretofore been declined for want of space. Those who wish to avail themselves of the advantages of its pages are informed that the terms of advertising are $1 per square (ten lines, or 100 words) for each insertion. Advertisements for the July number should be forwarded on or before the 15th of June.

Address, D. D. T. MOORE,
Rochester, N. Y.

**MONEY TO LOAN** on Bond and Mortgage, on improved farms. L. A. WARD,
[169m6.] 36 State St., Rochester, N. Y.

# Poetical.

### THE WORKING-MEN.

THE noblest men I know on earth,
Are men whose hands are brown with toil,
Who, backed by no ancestral graves,
Hew down the woods and till the soil,
And win thereby a prouder name,
Than follow king's or warrior's fame.

The working-men, whate'er their task,
Who carve the stone or bear the hod—
They bear upon their honest brows,
The royal stamp and seal of God;
And worthier are their drops of sweat,
Than diamonds in a coronet.

God bless the noble working-men,
Who rear the cities of the plain,
Who dig the mines and build the ships,
And drive the commerce of the main;
God bless them, for their sweating hands
Have wrought the glory of all lands.

# Rural Sketch Book.

[Written expressly for Moore's Rural New-Yorker.]

## A DARK CORNER IN LIFE.

BY DIANTHA.

IT is a fearful night; yet come with me down this deserted street. Wrap your cloak around you, that you may not feel its chilling dampness, as do those shivering wretches, vainly trying to find shelter from the rain and sleet.

Hark! the wind swells to a tempest. O! how it shrieks and roars like the clamoring of ten thousand warriors, met in fearful combat on the fields of air. Ha! you shudder as the lurid lightning darts a quivering glance—'tis darkness now, and with a sudden crash! peal after peal, the booming thunder roars above the trembling earth.—Ah! hear the winds! O! what fantastic play they have this night; now blending with the roar of billows as they lash the shore—now rushing o'er the house tops—up and down the streets—howling wildly round the corners—coursing with demoniac fury down the deep, dark alleys, where, with fluttering shingles, creaking sign-posts, shattered walls and flapping shutters, they make wild music in the dilapidated abodes of poverty. See! they circle round and with a shriek and flutter, thrust the rags and straw from out the broken panes, and dash the rain drops in among the shivering circles.

Look! there's a female form gliding o'er the pavement; instinctively she draws her thin shawl closer round her slender form. As she passes in the light from that shop window, you can catch a glimpse of her face. Strange face, is'nt it?—so wan and pale!—Yet there is fascination in the beauty of those deep, dark, melancholy eyes, that will haunt your memory for years. Her hands, how thin and cold; you can read famine in their transparency—and this is a child of fifteen summers.

She is going home now—home from the workshop, where she has toiled, toiled from earliest dawn till now. Going home—alone, unprotected, in the dark, with the wild storm raging all around her; home—where her sick mother has been left through the day, with an inebriated monster who bears the name of father!—and almost without food or fire.

—Now she remembers, as she hurries on, that her mother was paler, and more feeble in the morning; and, forgetting her own misery—her wearied, aching-limbs—her throbbing brow, her steps quicken down the dark, muddy lane. See! she stops and listens—hark! no sound save the rush, clatter, roar; and pat, pat, pat, of rain-drops on the wall.

Softly she steps within, and again pauses as if afraid to advance. No light—no fire upon the hearth—all silence—blackness! Again, bending, she listens—a faint drawn breath meets her ear. Quickly gathering some sticks upon the hearth, she fans them to a flame—the flickering glare revealed the scanty furnished room.

In one corner was a bed of straw, on which was a female form. The child, casting an anxious, searching glance around the room, as though in some dark corner she expected to see the prostrate form of her father, approached the bed on which lay the sufferer. "Strange she should sleep so deadly," she thought; and pressing her lips to the cold brow of her mother, crossed the room again. A scanty morsel was all she could find of food, and that she durst not eat; for she knew if her father came and there was nothing to set before him, abuse and even blows might be the consequence; so with a heavy heart she put it back again, and sank upon the stool by the fire, and buried her face in her hands. Not a morsel had passed her lips; the day before, she had saved her portion for her mother. Now, worn-sick, faint—hunger, like a vulture, gnawing at her vitals—she must watch the hours alone.

Let us bend over this bed in the corner—smooth out those raven tresses of flowing hair—wipe the cold sweat from off that brow—trace the outline of that something terrible, written on that countenance, so full of unutterable loneliness, unspeakable despair! Don't start back in horror! there is no parent, husband, sister, or friend—none, save this child of fifteen summers—to watch the parting hour. Now, whilst the dying woman sleeps her life away—the toil-worn, starving child sits by the feeble, flickering fire—the wild storm howls and roars without—the mad waves furious lash the shore—and that never-ceasing pat, pat, pat, of rain-drops is upon the wall. Come, sit with me on this worn old chest, and I will tell you a story about the dying woman and starving child.

EVELINE MAYBELL was the daughter of a wealthy farmer. Endowed by nature with rare genius and great personal beauty, she was at once the envy and admiration of all the town in which she resided. Her morning was as bright and lovely as ever beamed over the head of childhood. Like a morn in early spring—the sun casting a golden flood of light down upon the dew-gemmed earth—the wild carol of innumerable songsters—the smiling beauty of ten thousand flowers—the pensile stems decked with the bursting leaves, nodding in the balmy breezes—and a thousand forms of grace and beauty bursting into life, and yielding a grateful perfume. Such was the morn that smiled around sweet EVELINE MAYBELL.

You should have heard her voice: it was like the murmuring of many waters—all melody; and when she sung, her soul was in the theme, and you must have felt its pathos. A gentle, winsome child was she, with jet black hair, curling around features purely classical in their outline, where every shade of feeling left its impress. Her large dark eyes were the most striking feature in her countenance—soft and deep—brilliant and firey—wild and melancholy—as changing in their aspect as the restless sea. Of a book-loving disposition, she grew up beautiful, intelligent and well-informed.

She was sent to a boarding school in a distant town, to complete her education, and placed under the supervision of Madam S——. Here she remained for some time, and then returned home; but during this time she made the acquaintance of a young gentleman from a neighboring city, of reputed wealth, and received his addresses, much to the displeasure of her parents.—He was elegant in manners and address, and struck, as he was, with the rare beauty of her mind and person, he resolved to win and wear the prize, and assiduously set himself about the task.

She was fascinated, bewildered! True, rumor whispered in her ear that he was unprincipled, and her mother's sad look reproved her. At times she would try to break the spell, but the wreath of flowers that had been gaily twined around her, concealed a charm whose strength she could not force, so she submitted to be made captive and her destiny was linked for life with that of the stranger.

With him she went to the town, and was introduced into a polished circle of society. All that wealth could purchase was laid at her feet. Really proud of his beautiful wife, he spared nothing that would serve to make her the most brilliant and splendid, as she was the sweetest and most fascinating of women. He was highly connected with rich and polished familes—the son of a wealthy banker, and doing a good business for himself. Warm hearted, brilliant in conversation, easy in manners, but negligent in business habits, and alas! when but a child at his father's table, had learned to sip the wine cup, and the love, increasing with his years, had become the one passion for which he would sacrifice even his soul.

It was a fearful trial, when at an elegant party, where wine was as plenty as water in the mountain glens, she first discovered with woman's quick perception, that he was too gay and excited. True to her woman's nature, she strove to conceal it, and hoped he might not be thus tempted again. But when he came home intoxicated, her poor heart swelled and almost burst with grief and shame. Soon this became quite frequent, and her grief became a heart-grief, concealed by forced smiles in his presence. O! had he stopped here, struck penitent by her sad smile, and gentle reproachful look, what an amount of suffering might have been avoided. A sweet child, in every respect the counterpart of its mother, soothed her heart-grief, and formed another link that bound her down to earth.

Time rolled on—business neglected, soon became involved. Loss after loss greatly reduced his means, and he drank the more to drown his troubles. He was no longer a kind husband, but became soured, impatient and fretful! Still they were in affluent circumstances and lived in the show of wealth; yet her sensitive nature was acutely wretched—her childs sweet prattle and innocent affection was all her joy.

A sudden sweep of adverse circumstances rushed over them and swept their all away. Dispirited, he gathered what little he might and with his wife and child, left secretly for this distant city. Here he plunged into all kinds of vice, and became of all the most bold and villianous. No longer a man, but a monster, without feeling and beneath reproach—a gambler—a midnight thief—a sot—a beastly, cruel husband and father. But why recount—the wrongs, the crimes, the bitter heart-aches, might fill a volume.—Down, down he sank, dragging with him his wretched wife and child. Dragging down to want, and rags, and filth, and unsatisfied hunger, those bright, beautiful, innocent beings, he might have made comfortable and happy.

Years have rolled by—O, who can tell the accumulated misery of those years! But the drama is nigh closed. Its last scene is before you. Look! the mother with that ghastly face slumbers still—the child sits in the corner, her dark eyes vivid, burning, unnatural—rolling towards the street, and her heart throbs as she hears a foot step—it passes, and all is still again, save the raging of the furious storm—the wild-winds howl and roar, and that ceaseless pat, pat, pat, of rain drops on the wall.

The night wanes on—the hours sweep by. List!—one, two, three, and on with solemn tone, the bell tells out the hour of midnight. Though faint its throbbing on the air, it rouses the sleeper—a start and groan calls the watchful daughter. Poor child! she sees with sudden anguish, that the chill of death is on her vitals, that that grim monster has clutched among her heart-strings—rending them, one by one, from their fastenings. Sinking upon her knees, she clasps her mother's hands, but her eyes refuse to weep—her heart is bleeding! The wind whirls up and down the street, shrieks and groans, and bellows through the wretched tenement, that reels and topples beneath the shock. At length the eyes of the mother rest upon the child—she whispers, "'Tis almost over now—Heaven protect you—my child—and forgive your father—meet me up there, dearest—and you will soon—I feel—it"—her lips close—her breast heaves—then all is still.

The hours wear on—the tempest lulls—the fire upon the hearth flickers, moulders, expires! By its last gleam you see that bed, and by it the kneeling child—then all is darkness!

On the morrow they were found—that mother with those raven tresses—that child of fifteen summers, with those dark, melancholy eyes. That mother with her glassy eyes on Heaven—that child kneeling at her bedside, dead!

# Wit and Humor.

### WAR ANECDOTE.

ENCLOSED is an anecdote which I cut from an old Almanac. I think it too good to be lost, and wish you would publish it in the RURAL, so I can have it preserved, and for the amusement of the million. S.

The following incident is said to have occurred at New Orleans, during the invasion of that quarter by the British. After the battle of the 23d Dec., 1814, in which both armies received nearly the same injury, a subaltern British officer was sent to the American lines with a flag of truce. Being detained a little, he began to converse with a corporal in our service, respecting the probable issue of events there. He stated "it was folly for the Americans to resist any longer, as they must eventually be beaten—that the troops opposed to them were the flower of the British army, who had repeatedly vanquished the best veterans of the continent of Europe, and were commanded by *Lord* Packenham, *Lord* Picton, *Lord* Cockrane, *Lord* Kean, and many more of the ablest Generals in Europe." To this the corporal replied indignantly, "On our side we have the *Lord* God Almighty, the *Lord* Jesus Christ, and the *Hero* Andrew Jackson, and I'll be blamed if we don't whip you."

Two loafers met upon the wharf yesterday and passed the "compliments of the season." "Jim," said one, "have you seen Hall, he's looking for you?" "Hall! what Hall?" was Jim's answer. "Why Alco-hall, you fool." "Pshaw," responded Jim, "that's a poor 'sell,' and you wouldn't have caught me if I hadn't been hurt last night when John tripped me up." "John who?" said Bill. "Demi-john, you numskull."

WHEN is iron like a bank note? When it's forged. When is it like a stone thrown into the air? When it's cast. When is it like a public house? When it's a bar.—When would it do to make sausages of?—When it's pig iron.

PUNCH says that the heirs of Robinson Crusoe have instituted a suit for the recovery Juan Fernandez, on the ground that their great ancestor "was monarch of all he surveyed."

### KWIT PHUNNYGRAPHIC.

THE following specimen advertisement is copied from the Hartford Courant:

PHINE PHRESH PHIGS.—We have phortunately phetched in a phew phine phresh phigs, which we warrant phirst rate, and phancy will sell phreely, phairly, and phinely, to old and young pholks, phillibusters, phreesoilers, or the phree men, phriends, or phoes, that are phroud to phrequently pheast on such phodder and phinding ne phault.—They are phirst rate phruit, and would phill the eye of a Phrenchman or any other phoreigner. They can pe phound phor sale phor a phew days at Phuller's, 19 Asylum street—phirst phloor, a phew pheet phrom phriend Phap's phine phancy round sign. Don't phale to phetch a phriend, if you have pheeling phor a phine phellow, and don't phorget to phetch the phunds, and then there is no phear but that you will pheast phinely and PHARE WELL.

WET BARGAINS.—"Is this the place where they are selling wet goods, sir?"

"We have none wet yet this morning. Miss, but if you will wait a few minutes, I will set the boy to wetting some immediately. What kind of goods do you wish? We will wet anything which water don't spoil, to order. Here, John, wet all the remnants of the four cent muslins in the shop, and put them out by the door, labeled *only five cents*—do you hear?"

A DUTCHMAN related a misfortune which befel his son in the following manner: "Pour Hans! he bit himself mit a rattlesnak, and vash sick into his ped speechless, for six weeks in to munt of August—and all his cry vas vater! vater! and he couldn't eat noting except a leetle tea."

AN exquisite young lady wriggled into a linen draper's, and, with the most excruciating drawl she could affect, inquired if they had any "subdued mouse-colored silk."

"No," replied the draper, with a sudden and expressive twirl of the yard-stick, "but we have some *enraged rat-color*."

ALL FOOLS.—"I thought you were born on the first of April," said a benedict to his lovely wife, who had mentioned the twenty-first as her birth-day.

"Most people might think so," she replied, "from the choice I made of a husband."

THE best way to curb a wild young man is, decidedly, to *bridal* him.

### ARITHMETICAL QUESTION.

THREE persons, A. B. C., started for a certain place; they were to stop at four different hotels. Their bill at each hotel was fifty cents. A. proposed to B. and C., if they would solve his problem he would pay their bills, otherwise they were to pay his. A. says, I have not money enough to pay our bills, but if I pay at the first hotel, and then borrow as much as I have left, then pay the second bill, and then borrow as much as I have left, and so on to the fourth, it will take all my money. What sum did he start with before he paid the first bill? C. F. C.

Fenner, N. Y., May, 1853.

Answer to Enigma for the Times—Brandy, Whiskey, Rum, Gin, Wine, Beer, Snuff, Tobacco, and Cigars.

SEYMOUR & MORGAN'S PATENT

**NEW YORK REAPER, FOR 1853.**

THE great value and importance of the *Reaper* to Grain Growers of the world, is established beyond a question of doubt. Frequent tests have been made before Agricultural Societies both in this country and in England, proving the Reaper to save in a single harvest its first cost to the purchaser, over the ordinary way of cutting grain. Probably no implement is as valuable to the farmer where any considerable quantity of grain is raised, as the REAPING MACHINE.

At the present time there are several very good Machines before the Public, and now the question seems to be—which is the best? We claim precedence for ours, considering some of the following principles embodied in our Parents, that are essential to a Reaper and CAN NOT be found in any other Machine; which enables us to offer to the farmers of the United States a

Superior and Perfect Reaping Machine,

which, for durability, exactness of construction, perfect manner of cutting grain, ease with which it may be worked, and lightness of draught has

*NEVER BEEN EQUALLED!*

1st. The cutter bar is placed nearly on a line with the axles of the driving-wheel, and nearly opposite the driving-wheel is the ground-wheel, which being *thirty inches in diameter*, lessens the labor which has heretofore been performed in working such Machines, and does away with all difficulty in backing and turning.

2d. The knife or sickle is scalloped and in sections, which *cannot be clogged*; and in case of accident can be repaired by any good blacksmith.

3d. The man in discharging the grain stands on the *rear* of the platform, where he has his work before him and can perform it in a perfectly natural and easy manner; and also from the construction of the attendant's stand he may change his position according to the length and amount of straw cut.

4th. The new and improved combination box, containing the smaller gear, combines *great strength* and *durability*, with perfect simplicity of arrangement, preventing any displacement or twisting of the gearing; in this it possesses great advantages over any other similar Machine and so far as we know, there have been no failures in the large number made.

5th. The lightness of the Machine and mainly of the side-draught or pressure, which being obviated, enables a *single team* to pass with it over uneven ground with speed and ease.

We make our acknowledgments to the farmers for that generous confidence we have labored so diligently to sustain; and encouraged by the past, we have again commenced the manufacture of a large number for 1853, which we sell under a strong "WARRANTY." The Reaper shall be well made, of good materials, durable with proper care, can cut from 15 to 20 acres per day with one span of horses, and do the work better than done by ordinary cradling, or NO SALE!

Innumerable certificates might be given of the great value of this Machine, but our Reaper is so well known, we deem it unnecessary. By reference to the Reports of our State Agricultural Society, on the trial of Reapers, held at Geneva, N. Y., in July last, it will be seen this Machine cut a given amount in about three-fifths of the average time of other Reapers. The following gentlemen are Agents for the sale of the New York Reaper, and any orders received by them will be filled in due season:

S G Williams, Esq., of Janesville, Wis., is our General Agent for the West, and is authorized to appoint sub-Agents, except in Ohio and Southern Indiana.

Wm Bosworth, is General Agent for the State of Ohio except a few counties. Messrs. Warder & Brokaw, of Springfield, Ohio, have the exclusive right to make and vend for Southern Indiana, north to the 40th deg. of lat. running east to the Ohio Canal, including the south-west corner of the State of Ohio.

SEYMOUR, MORGAN & CO.

Brockport, Monroe Co., N. Y. [175eowtf.]

E. D. HALLOCK, No. 24 Exchange St., Rochester, has been appointed sole Agent for the sale of the above Reaper, in that city. He will have a Reaper on exhibition at his Agricultural Warehouse, and will at all times be prepared to fill orders at manufacturers prices.

GARDEN AND FIELD SEEDS

*From the New Establishment of Van Zandt & Bowdish,*

No. 114 State street, Rochester, N. Y.

CAN be purchased of the merchants generally throughout the country, in Papers or Packages, on the most reasonable terms. Also at the Agricultural Warehouse of E. D. HALLOCK, No. 24 Exchange street, near the Clinton Hotel, Rochester, N. Y.

The Seeds from this establishment can be relied on as being of the very best quality. They are mostly imported, or grown by the EASTERN SHAKERS, and are warranted.—Full directions for cultivation printed on each Paper and Package. VAN ZANDT & BOWDISH.

Rochester, N. Y., 1853. 170m6.

Pure Bred Male Stock at Private Sale,

AT MOUNT FORDHAM, WESTCHESTER CO.,

Eleven Miles from City Hall, New York.

I WILL sell and let from 10 to 12 Short Horned Bulls and Bull Calves, 4 Devon Bulls and Bull Calves, and from 12 to 15 Southdown Rams. The annual sale by Auction will be omitted this year, as I wish to reserve all the Females, having recently purchased another Farm, to enable me to increase my Breeding Establishment. My Hog Stock, including all the Spring litters, are engaged.

Catalogues with full Description and Pedigrees of the above Bulls, and Southdown Rams, with the Prices attached, can be obtained by the 15th April next, from the subscriber, or at any of the principal Agricultural Stores, or from the Editors of the principal Agricultural Journals.

March 23d, 1853. 170m3 L. G. MORRIS.

MOORE'S RURAL NEW-YORKER:

A WEEKLY HOME JOURNAL,

For both Country and Town Residents.

PUBLICATION OFFICE,

BURNS' BLOCK, CORNER STATE AND BUFFALO STS.,

ROCHESTER, N. Y.

TERMS, IN ADVANCE:

TWO DOLLARS A YEAR—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

Terms of Advertising

ONE DOLLAR per square (ten lines—100 words, or less,) for each insertion,—*in advance*. ☞ The circulation of the NEW-YORKER is much larger than that of any other newspaper published in the State, out of New York city. Only a limited space, however, is devoted to advertisements, and hence preference is given to those most appropriate—such as the cards and notices of dealers in Agricultural Implements and Machinery,—Horticulturists and Seedsmen,—Booksellers and Publishers,—Inventors, etc. All orders by mail should be accompanied with the cash.

To enable us to accommodate as many as possible, brief advertisements are preferred. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

THE WOOL GROWER AND STOCK REGISTER.

THIS is the only American Journal primarily devoted to the interest of Wool and Stock Growers, and should be in the hands of *every owner of Domestic Animals*. It is ably conducted, published in the best style, and finely illustrated. Each number contains a careful Review of the WOOL and CATTLE MARKETS, and much other *useful* and *reliable* information which can be obtained from no other source. The Fourth Volume commenced in July last.

TERMS:—FIFTY CENTS A YEAR; Five Copies for $2; Eight for $3; Eleven for $4. Back volumes, bound in paper, at 40 cts. each,—unbound at 35 cts., or three for $1.

Published monthly, in octavo form. Specimen numbers sent free. Money, properly enclosed, at our risk.

Address D. D. T. MOORE, Rochester, N. Y.

# MOORE'S RURAL NEW-YORKER.

VOLUME IV. NO. 22. ROCHESTER, N. Y.—SATURDAY, MAY 28, 1853. WHOLE NO. 178.

**MOORE'S RURAL NEW-YORKER:**
A QUARTO WEEKLY
**Agricultural, Literary and Family Newspaper**

CONDUCTED BY D. D. T. MOORE,
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter—interspersed with many appropriate and handsome engravings—than any other paper published in this Country.

☞ FOR TERMS, &c., see last page.

## Rural New-Yorker.

### Progress and Improvement.

#### LIME APPLIED TO SOILS.

IN a former article upon this subject, we gave the analysis of several different beds of lime, and the different forms in which it was applied to soils,—that is, in its broken, ground, or, as is more in use, in a calcined state, and closed while remarking upon the application of lime fresh burned.

Strong reasons for applying lime as soon as practicable after burning, and in a powdered and caustic state, are, that a less quantity will answer the purpose of covering the surface of the ground, that it comes more readily into contact with the minute particles of the land, and acts more powerfully upon all organic matter, such as the roots and fibres of plants, seeds, insects, and recently applied manure, accelerating their decomposition, transforming them into vegetable mould, and converting it into proper food for plants.

Upon sour, unhealthy soils, or upon those where wild grasses and noxious weeds abound, it acts as a corrective, giving health and vigor to the land. So also, during the process of slacking the heat generated by the absortion of moisture swells the soil to an extent which renders it less tenacious,—fermentation may be produced, hard soil made mellow, woody and animal fibre converted into elements which, by the aid of rain, may be readily and easily appropriated by growing plants. In such applications, judgment and caution are necessary lest the farmer be led into the error of applying more than is requisite, as too large a quantity, from its well known caustic qualities, will destroy, to a certain extent the efficacy of animal manures, or by combining with certain of their elements form some new chemical arrangements, rendering them improper or unattainable food for growing vegetation. Quck-lime added to stable manure in a state of fermentation burns it so much as often to render it unfit for use, or if used of very little value. It should, in consequence, be mixed with barn-yard manure, in small quantities, and then only necessary to destroy the seeds of the noxious weeds, or to assist in the decomposition of roots and other coarse vegetable matter, in manure designed for immediate use. If manure and lime are both to be applied to land, our recommendation is to put on the manure and plow it under, and then sow the lime, and harrow it in with the seed.

Different soils require various treatment, and are benefited in a different ratio to the amount of lime employed in propertion to their power of combining and rendering useful the lime as applied. There are so many phases exhibited in the use of lime on various soils, and in the quantities used, that a volume would hardly suffice to give a practical and full elucidation of the subject. Therefore farmers knowing its properties and action, can, by the exercise of good judgment, aided by observation, soon determine the best method of applying it, as well as the amount which may be used with benefit.

It should be understood that lime is a requisite in the growth of all plants and trees, and may be considered an essential part of all vegetable substances as a direct food. It is found by chemical analysis, to vary with the different plants and grains, but never entirely wanting in any. It varies with the soil upon which the plants grow, as a tree grown upon streng lime-stone land is found to contain nearly fifty per cent. more lime than a tree of the same species grown where but little lime was to be found. From this, we deduce the fact, that plants and trees make free use of lime where it is abundant, while a soil in which it is not found, or in which very little exists, is unfit for agricultural purposes.

In the application of lime which has to be purchased by the farmer, be the cost never so little, he will desire to get along with as small amount as will answer well the purpose for which it is used. Dr. LEE says he has become satisfied from experiments and analysis that two per cent. of the carbonate is as good as a much larger quantity,—that the excellent wheat lands of Wheatland are not improved by its application, and in none of that soil has more than two per cent. been found. The Dr. expresses the opinion that "instances are rare where one per cent. exists that the addition of more is beneficial, or pays the cost of application." He further says, "if all the lime in an acre of the best wheat land in this district were separated from the soil to the depth of ten inches, the amount would be from ten to twenty tons."

Assuming these statements to be true, there is little danger of any farmer's buying and applying too much lime to his land, and we are at a loss to understand how too much can well be used, or why a critical analysis of the soil can be necessary before applying the lime. There are, however, some very important considerations connected with the application of lime to which the attention of farmers cannot be too emphatically directed. Some of these have been very distinctly set forth in an able essay read before the N. Y. State Agricultural Society, by R. L. PELL, Esq., and published in the volume of Transactions for 1846. A portion of them may be briefly adverted to as follows: Never use caustic lime upon dry, sandy upland, and never use lime of any description upon land that has not been thoroughly drained, if wet. In its application after seeding, it is recommended to put it on in dry, summer weather, in a powdered state, and by often and shallow plowing mix it thoroughly with the surface soil. When applied in a caustic state, plow it under before it slakes, as much of its value is otherwise lost in the atmosphere.

There are many other important matters connected with the use of lime, to some of which we may call the attention of the reader at another time.

#### USE AND SUPPLY OF FUEL IN THE U. S.

"WOODMAN spare that tree."

A SAGACIOUS foresight—a due preparation for the future—a proper solicitude for coming wants and exigences, both for ourselves and offspring, is highly commendable and praiseworthy. On the other hand, undue anxiety—carking cares—a ceaseless and slavish effort to hoard up riches and amass wealth, and the cultivation of a miserly spirit, are censurable in the highest degree. "A prudent man forseeth the evil, and hideth himself." This was regarded as good practical philosophy four thousand years ago. How great a pity that its teachings are so little regarded by men in these latter times, when improvement is the boast of the age.

Who that has any knowledge of the vast amount of wood consumed annually in our country, for warming and culinary purposes,—by forges, factories, steamboats and railways,—but must entertain fears for themselves and posterity. We have not the statistics at hand, to show the yearly consumption throughout our country, but from some local statistics, we may deduce general facts. The Rutland and Burlington Railroad, 122 miles in length, consume annually 20,000 cords. The Whitehall and Troy Road, some 80 miles in length, consumes 9,000 cords. Schenectady and Utica, 78 miles in length, 15,000 cords. The roads from that point to Buffalo consume over 40,000 cords. The roads from Albany to Boston, 202 miles in length, consume over 33,000 cords. The steamers on Lake Champlain consume upwards of 100 cords daily, through the business season. The furnaces and forges on its shore, eight in number, consume annually 90,000 cords. The Salt Works at Syracuse, N. Y., when all the fires are in operation, consume 1,000 cords every day, or in other words, the wood from 25 acres of well timbered land!

From the above data, we find that one mile of Railroad requires at least 160 cords of wood to supply it yearly; consequently the 13,000 miles of road in our country, would consume annually 2,080,000. When the 20,000 miles of road, now either under contract or contemplation, is added to that already in operation, 5,280,000 cords of wood will be required annually to feed the engines with fuel.

Allow 40 cords to be an avarage yield of wood to the acre, then every mile of road requires annually 4 acres of wood to supply it. The 13,000 miles of road will consume the wood every year from 52,000 acres. When the 33,000 miles are in operation, the wood from 132,000 acres—a territory of over 200 square miles in extent—will only supply these roads twelve months. In addition to this vast amount is to be added what is consumed by the 24,000,000 of inhabitants in the country. Allowing the number of families to be 3,000,000 and each to consume only ten cords each, then 30,000,000 cords is required annually for their comfort and use. In other words, the produce of 750,000 acres—an extent of territory equal to 1,172 square miles.

Thirty-eight townships, six miles square, of heavy timbered land, is required for the inhabitants and their Railroads annually, to say nothing of factories, forges, steamers, &c., which must swell the amount to upwards of 12,000 square miles of territory! It is true our coal fields are unbounded, yet the want of fire-wood is already felt in some districts, which, like the prairies of the west, are naturally destitute of timber, or in which locomotives and steamers are consuming the article faster than it can be reproduced in the ordinary course of nature. Many localities which I could name, especially near the sea-coast, have been completely shorn of timber. Much inconvenience is now felt in consequence, and the evil is progressive, threatening the comfort and interests of farmers, mechanics, and all classes engaged in industrial pursuits; and considerations not merely poetical, but economical and practical, would in more instances than one call out to him, "Woodman, spare that tree!"

In all new countries, a terrible mania seems to actuate the pioneer to exterminate every bush and tree, and measure his enterprise and success by the number of acres of wood he can convert into ashes, or leave in a girdled and dying condition. Now we enter our solemn protest against this ruthless Vandal warfare. In all new countries shade trees should be left along the roadside, and groups in every pasture, and a grove around every house. Were this the case, how romantic and beautiful would be the aspect to the traveler, to say nothing of the comfort they would afford. In olden towns trees should be transplanted and cultivated, not only for their comfort and beauty, but as a matter of practical economy. Trees should be regarded as companions, and entitled to protection. They should be looked to as physicians—as breathers of oxygen, as consumers of nitrogen, as friendly to our existence, and auxiliary to happiness and length of life.

In France and many other European countries, the beach is cultivated as we cultivate the apple tree, and the road-sides are lined with the poplar, the tops of which are over and anon cut off for fuel, and left to grow again. The beach grows rapidly, so does the elm. In the neighborhood of the writer are two elms, one of which is seven feet in circumference, which sixty years since was used as a bush, on which to spread clothes on "washing day," by a lady now residing under its branches; the other

FRENCH MERINO RAM, "TEN THOUSAND,"
THE PROPERTY OF S. W. JEWETT AND H. S. MORSE, OF MIDDLEBURY, VT.

is full ten feet in circumference "at the butt," and was used as a "hand-spike" on a certain occasion, and left sticking in the ground. It took root and flourished, and for many years has been an object of admiration, overshadowing as it does the highway, and affording a cool retreat and resting place for the weary traveler. It is sixty-four years of age, dating from the time it ceased to be a "hand-spike." The sugar-maple is a highly valuable as well as an ornamental tree. Its growth is rapid on a rich loam soil.

Twenty-five acres of thrifty wood-land will support a family of two fires and replenish itself, provided the lands are fenced against cattle. And we cannot urge too strongly upon the attention of proprietors of wood lots, the stern necessity of fencing them, and protecting them against the invasion of cattle, sheep and horses. When farmers have a scarcity of acres of wood-land, let them put out twenty-five trees each spring (if they will not do it all at once) for eight years, making 200 trees, and manure and protect them, and they will most assuredly find that their children will rise up and call them blessed. Trees abound in the elements of beauty, which may be combined in a thousand pleasing forms. Their culture enables the skillful artist to paint his landscape in living verdure—to present to the eye open fields and shading groves, wood-crowned hills and sun-lit vales, in charming contrast. Without trees the world would be a desert; with them it can be made a paradise. They temper both heat and cold, prevent the injurious dryness of the atmosphere, and greatly promote the fall of genial showers and seasonable rains, in spring, summer and autumn. For wood, timber, lumber, staves and a thousand uses, they are invaluable. In no other country than ours do we find such magnificent shade trees, such extensive and superb primeval forests, and in no part of the world is the re-productive power of the soil less exhausted than in our own. Hence we would summon the winds and the waves to utter, in an earthquake voice, "Woodman spare that tree!"

Cornwall, April, 1853. S. B. ROCKWELL.

#### ROOFING TILE.

EDS. RURAL:—In your 3d volume, page 370, over the signature of WM. LAVERICK, Jr., is an inquiry respecting Roofing Tile. I was in hopes that his inquiry would be the means of obtaining farther light upon the subject, from some of your numerous readers. But fearing that it will pass by without an answer, I would renew it, and at the same time give what information I have been able to obtain thereon. It is evident that the tax for roofing materials to the inhabitants of Western New York is every year growing more expensive. Suitable timber for shingles is fast disappearing, and it is frequently the case, though a man has taken all the pains he could to get a good article, when he comes to use them he finds that they are not fit for the cheapest kinds of out-buildings.

Three years ago this winter, I commenced to build my drain tile shop. The main building and shed is 44 by 80 feet. At the time I had two Germans at work for me; they were able to converse sufficient for me to learn that they understood something about Roofing Tile, and I concluded to try the experiment by covering my building with them. They have now been on over two years, and not a single tile has shown the least appearance of crumbling to pieces. My German workman tells me he has seen tile on buildings in Germany that the date on them run back near 400 years, and still answering a good purpose. I was unfortunate in getting a good pattern for roofing tile, though they answer a good purpose to keep out rain, and, when there is no wind, snow also; but our driving snow storms send in the snow badly. In Germany they are made and laid so that no snow gets through the roofing. I have frequently had tiles taken off of my building by high winds.

The latest and most approved pattern of roofing tile in Germany, I understand, is a flat tile, made to admit a shingle under each joint, two inches in width. Can some of your numerous readers give a description of the latest and most approved pattern of English roofing tile?

It is my opinion, that if people in this country would encourage the manufacture of roofing tile by using them first on out-buildings, in a few years American enterprise would so far perfect the article, that they would come into general use. The objections that I have found in my first effort, I think might be nearly or quite overcome in a second trial. As to the difference in the cost between shingles and tile, it would be difficult to state correctly, as the price of shingles differs so much in different sections, and the amount of surface that each kind was laid to the weather would effect the price also. In this vicinity, where shingles are worth from $3 to $4 per 1000, a tile roof would cost about one-third more. There would be a saving of half of the roof boards, and all the shingle nails. Buildings covered with tile would be less hazardous by fires, and Insurance Companies could take risks at reduced rates. B. F. WHARTENBY, of Waterloo, has made the most roofing tile of any man that I have any knowledge of in Western New York. His is a trough tile similar to those described by Mr. LAVERICK. ALVIN WILCOX.

West Bloomfield, N. Y., 1853.

#### CHANGE IN CLIMATE.—NO. I.

A VERY important change has taken place in the climate of our country; it is very different now from what it was when the country was first settled, some sixty years since. The cause of the change, however, does not appear to be well understood—some assigning one cause for it, and some another—Few, if any, it appears to me, have even approximated to the truth in regard to it.—By some it has been suggested that in consequence of "uplifts," and earthquakes, caused by *internal fires*, a radical change was gradually taking place in the form of the earth, and that the climates of different places became *milder*, or more severe, according to the modifications, or changes of

form. Others, again, have supposed that it was owing to a change in the relative positions of the heavenly bodies, so that those portions of the earth's surface, which were once within the range of the perpendicular rays of the sun (the supposed cause of heat to our earth,) are now thrown into *oblique* positions; and hence a change of temperature occurs. There is no doubt but internal fires, causing uplifts and earthquakes, do produce very considerable changes in the *form* of the earth, and consequently upon the temperature of different parts of it, and it is very probable that a change in the relative positions of the heavenly bodies has taken place, so as materially to change the perpendicularity of the sun's rays from former places, to those where it now is. Indeed there seems to be sufficient proof of this, as we frequently find the petrified remains,—and were the preserved skeletons and carcasses of animals (now known to exist only in the tropical regions,) not only in the temperate, but in the frigid zones, where, from their peculiarities of constitution it would seem impossible that they could, at the present time, exist, even through a single day. Both causes may have some agency in producing revolutions in climate, in different portions, or the whole of this mundane sphere.

However this may be (and it is not, perhaps, of much practical consequence to us, at present,) it is an undoubted fact that the climate of a country is very materially affected by the situation of it in regard to the clothing of its surface with thick forests, or its having little or no vegetable matter on its surface.

Some sixty years ago the country where I resided, was covered with a heavy growth of timber, with a thick under-growth of brush, and, in the summer season, with weeds; so that it was almost impossible to see an animal, or even a human being, standing at a distance of only a rod or two. The thick shade of the forest, impervious to the rays of the sun, kept the air in the woods, cool, even in the hottest weather in the summer. In the small "improvement" made by the first settlers, the heat of the sun was very considerable during the day; amply sufficient to cause a vigorous growth of all the cultivated plants and fruits. But, as the sun descended below the tops of the forest trees, the cool air from the surrounding woodlands, being heavier than that in the open fields, gently flowed in, and by "uplifting," displaced the more rarified, or lighter air in the improvements. And this alternate heating and cooling process has continued until the present time, the heat increasing in proportion to the improvement, or rather the "clearing" off of the vegetable covering of the earth's surface. The consequence is that the rays of the sun now heat the air over the whole surface of the country, and there is now no cool air to displace it. The heat also penetrates to the depth of several feet into the surface of the earth; and the earth retains that heat for a long period of time.

Formerly, when the "clearings" were of small extent, the snow never drifted from any part of the surface of the earth; and the ground was generally well covered with it, from the middle of November until the middle of April. Now the snow seldom lies evenly spread over the ground, and the rays of the sun have a very considerable effect in warming the air and earth, even during the winter season. 'HIEL.

## CONDENSED CORRESPONDENCE.

### Eradication of Quack Grass.

MR. EDITOR:—As the subject of the eradication of quack grass (*Triticum Repens,*) has engaged the attention of your correspondents, from time to time, and as the general opinion appears to be, that it is one of the farmers inexterminable pests, I propose to give you my experience with it; which, if you think interesting to your readers, is at your disposal.

Some five or six years ago, I noticed a new kind of grass (now to me—never having seen any of the kind before,) in a field of ours, which was under the plow. Not knowing what it was, no pains were taken to destroy it, further than the usual plowing. Finding the next spring that it had greatly increased in area, I began to make inquires about it and was told that it was common in the eastern part of the State, and that its extermination was more difficult than that of the Canada thistle. How the grass got there I cannot tell, as there was none any where else in this vicinity at the time, nor is there yet to my knowledge.

The field was planted to corn, with the hope that by careful hoeing, the quack grass might be destroyed. But notwithstanding it was all carefully cut up or covered, it had extended its usurpation considerable by the next spring. Seeing that a vigorous war of extermination must be waged against this agressor, or it would overrun the premises, the field was again occupied with a hoed crop, and increased pains taken to destroy every spear of the quack, at each hoeing, but with no better success than the previous year.

The grass had spread over about four acres, and giving up all hopes of its extermination by the hoe, or by deep plowing, which had also been unsuccessfully tried, I determined to put a "veto" upon its further extension, if possible; I therefore seeded down the piece with Timothy, and kept it closely fed down with sheep, taking care to cut all which was not accessible to the sheep before the seed was ripe. Under this treatment, the quack grass gradually gave place to the Timothy, until now there is scarcely a spear of the vexatious quack to be found in the field.

From this I am inclined to think, that it is not necessary—as you suggested in your remarks upon the inquiries of a former correspondent—to pack up one's goods some dark night and leave, because that life-loving weed, quack grass, has taken possession of a favorite field. Perhaps pasturing with sheep would not be as successful in all cases; but I am of opinion that in most soils feeding closely, especially in dry weather, will kill it out.—N. M. CARPENTER, *Ellington, N. Y.*, May, 1853.

### "Political Farming"---Again.

MR. MOORE:—In your RURAL I find a small sketch on "Political Farming," and you call it a good thing, and wish to keep it in motion. Now, sir, if you call such a man a farmer or a politician, you and I must differ. I think they are neither. A farmer is a man who cultivates the earth to produce the grains and fruits thereof; and he who performs that labor in the best manner and with the least expense in proportion to the amount produced is the best farmer. This requires talent of thinking, judgment to direct, and reflection to correct; without which no man can be a successful and practical farmer. And show me in Seneca County, a man of the above qualifications as a farmer, and I will show you a political farmer. This Republic has many farmers, who if called from the plow would guide the wheels of State or nation with political judgment for the Republic and honor to themselves. I know a man who attends all primary meetings in his town, and is well acquainted with the policy of the State and Nation, and, sir, a visit over his farm is a rich treat, a perfect model of neatness and order—a place for every thing and every tool in its place. His large crop of corn was over one hundred bushel of ears per acre, his oats over sixty-five, and his wheat thirty. His manures are all saved, and the most of his manures are drawn and spread on his fields in the winter season, and his teams, stock and farm grow fat while he grows rich, happy and intelligent.

A SUBSCRIBER.

Seneca County, March, 1853.

### Sale of Blood Horses.

MR. EDITOR:—I am in receipt of "The Jerseyman," published at Morristown, of the 12th inst., containing the sale of blood horses, belonging to the estate of the late WM. GIBBONS, of Morris Co., N. J. Mr. GIBBONS bred the celebrated "Fashion;" she, it seems, was on the list—and when her purity of blood, her fame, and speed as a racer, having (against Boston,) made the quickest time, 4 miles, her *price* cannot be said to be *exorbitant.* The publication of the items of the sale may interest some of your readers. They are as follows:

"Nimble," a chestnut filly, 2 years old, bought by A. H. GOODWIN, for $230. "Philo," by Mariner," out of "Cassandra," 2 years old, T. T. WOOD, $350. "Hermes," out of "Fashion," 1 year, $180. "Basil," a brown horse, by "Mariner," bought by JOHN WELSH, to go to Canada, for $620. "Basil" has run a mile in 1.44, the quickest time ever made. "Trojan," by "Mariner," by T. T. WOOD, $450. "Mariner," 17 years old, by "Shark," out of "Bonnets-o'-Blue," $270.—"Pastry Anthony," a brown mare, 13 years old, for $280. "Cassandra," a brown mare, 15 years old, with foal, L. G. MORRIS, of Morrisania, $520. "Fashion," a chestnut mare, by imported "Trustee," out of "Bonnets-o' Blue," 19 years old, with colt one week old, by "Mariner," bought by Mr. MORRIS, for $1,550. "Bonnets-o'-Blue," mother of "Fashion," and "Mariner," 26 years old, perfectly white, and nimble as a colt, by D. A. CROWEL, Morristown, $100. A Norman stallion, 15 hands high, and weighing 2,000 lbs., for $200.

*Ludlowville, N. Y., May,* 1853. C. M.

SHALLOW TILLAGE, says Mr. WALKER, has written its own epitaph on the broad acres of worn out lands which disfigure once fertile regions—on the gullied fields, from which the last vestige of vegetable remains have been washed: those are the tongueless, but eloquent, monuments of the wrongs of this practice.

## AGRICULTURAL INTELLIGENCE.

### N. Y. State Ag'l College.—Its Location.

WE named the Trustees of this Institution last week, promising to refer to it again, and now learn that it is located near Geneva,—Mr. DELAFIELD'S beautiful farm in Seneca Co. having been purchased by the Trustees for that purpose at a cost in the neighborhood of $30,000. The *Geneva Courier* states that Mr. DELAFIELD will become President of the Agricultural College, for which station he is eminently qualified, especially as a successful farmer and business man.

The *Courier* adds:—"As a matter of course it will be a stock company who will engage in it, and in this way it will be wholly beyond State control, or the grasp of politicians. Perhaps there is not another position in this State, where there are so many things combined to render it just the place for such a Seminary. The soil is the very best, and this farm of 300 acres is under the very highest cultivation. It is accessible from every part of the country by railroad and steamboat, and its position within a mile of Seneca Lake, which it overlooks, renders that feature of it strikingly picturesque and beautiful. M. D.'s residence is half a mile from the public road, and the College buildings and grounds, although overlooked by Geneva, will be beutifully retired and away from observation."

THE officers of the *Herkimer* County Ag.'l Society for 1853, are the following:

*President*—ALONZO L. FISH, Litchfield.
*Vice President*—Dean Burgess, Winfield.
*Secretary*—Solomon L. Morgan, Ilion.
*Treasurer*—John A. Rasbach, Ilion.
*Executive Committee*—Seth Bonfoy, Winfield; Robert Earl, Herkimer; David D. Devoe, German Flatts; Peter H. Warren, Columbia; Anson Rider, Litchfield.

## THE AGRICULTURAL PRESS.

### Green Crops for Barn use in Summer.

THE following valuable hints are from the May No. of the *Genesee Farmer:*

BY soiling is meant the system of feeding cattle in sheds and stables on green food grown for the purpose, instead of allowing them to graze the fields at pleasure. That more food can in this way be obtained per acre, few will question. That we can adopt soiling, except in some few cases near large cities, admits of some doubt. One of the great objections to the practice is the greater amount of labor required in mowing and carrying to the barn the green food, than in letting the cattle cut it themselves. Another objection is that our climate is not so well adapted for the production of succulent summer food as the cool moist climate of the British isles. Yet, as we have often said, we obtain heavier crops of red clover than do British farmers, and red clover is there considered one of the best crops for soiling purposes; and could it be grown with as *much certainty* and in such quantity as in Western New York, it would be much more extensively used.

We believe it would pay every farmer to take an acre or two of clover, as contiguous to the barn as possible, and manure it highly in the fall or spring. It would be found of great advantage to cut and feed to the horses in the stable at noon, and for an hour or so before turning them into the field in the evening. A few acres so manured and *cut early* would afterwards yield a splendid crop of clover seed; or it might be mown twice, as green food for the horses and cattle.

Indian corn is perhaps the best food that we can grow for green food in summer. It stands drouth better than any other crop; and if the soil be rich, an immense amount of nutritious food can be obtained per acre—certainly more than from any other summer crop. For this crop the soil should be either naturally very rich or be well manured. Let it be prepared as you would your other corn land. The deeper it is plowed, and the mellower it is made, the better.—*Four bushels* of seed should be sown broadcast per acre, as soon after corn planting as possible If the soil is moist and in good, fine order, soak the seed corn for twenty four hours previous to sowing. In this way it will be up in two or three days, and will get the start of the weeds; and if the corn is sown thick, and grows well, it will smother them all, and leave the land in good condition for the following wheat crop. Perhaps, however, it would be best to sow the corn in rows twelve or fifteen inches apart, and hoe it once or twice; the corn would grow more rapidly, and the soil would be cleaner.

Lucerne answers well for soiling purposes, but its cultivation is attended with considerable labor in keeping the soil free from weeds. It is a perennial plant, and does not reach its full growth till the third year. On a rich, sandy loam, well under-drained, plowed, and subsoiled, immense crops of lucerne can be grown. Guano is a splendid manure for this crop, and possesses the advantage of being free from weeds. Lucerne is sown early in the spring, in rows from one to two feet apart; eight or ten pounds of seed per acre. It must be frequently hoed and kept free from weeds, and should be cut but once the first year; in after years it will afford three or four crops in a season.

### A Left-Handed Plow.

WE find the following communication in the *Prarie Farmer*:

When in a neighborhood of real go-ahead, enterprising farmers (those who have thrown the stone out of the bag) I see mostly used the left-handed plow for breaking. Where there are good barns, neat dwellings, fine stock, and large meadows, I see the left-handed plow. Well, says one, where is the great advantage of the left-handed plow? Well, in the first place, the same team will break more ground, and do it better, than with the right-handed plow. How is this? Your lead horse always walks in the furrow, consequently your plow always cuts the same width of furrow; whereas, with the right-handed plow, your lead horse walks near the furrow, and the nearer the furrow he walks, the less the plow cuts; and, when the ground is very hard, he is sure to step into the furrow (for some horses have more sense than some folks:) in so doing he pushes the off horse on the plowed ground, and thus throws the plow entirely out, consequently the land is as full of gouts as badly spun yarn, and finishing a land the team has to be turned several times at different places, or go over the same ground several times. All these difficulties are avoided in the left-hand plow. With your lead or near horse in the furrow, and off horse held to his place by a jockey stick extending from the leader's breast to his bit, let the plowman be ever so careless, the plow continues to do its work with uniformity. Another consideration of importance, almost any horse can be taught to go by the single line. When a field is broke as it should be, the dirt is thrown to the fence, so there is left a a ridge six or eight inches high all around in the field—first, by being thrown there in breaking, and secondly by cleaning the plows in cultivation.

### American Madder—"Pinkroot."

THE *Lowell Journal* on the value of home-grown madder for dyeing, shows that its culture is successful in all parts of the country:

The experiments which have of late been made with the home-grown madder, have proved that, when properly treated, American is equal to the best French grown madder. Like Turkey, Dutch, or Alsace madders, the American requires the addition of a little chalk to produce the best effects.—During the past winter, the Morrimack Company have used, with great success, some madder grown in Montague, Franklin County, Mass., and are now about to dye some calico with this Massachusetts madder, to be exhibited at the Crystal Palace. Within a short time the Merrimack company have received a small sample of madder grown in Georgia, which proves to be an excellent article—quite equal to that of Massachusetts. The Journal is informed that there grows wild in Florida, a plant whose root, when eaten by hogs, colors their bones red. Such is the effect of the madder.—Doubtless this is an indigenous species, whose cultivation would reward the planter. It is to be hoped that samples of this Pinkroot, as it is termed in Florida, may be forwarded to Lowell for trial in dyeing.

### Feeding Stock.

THE following is from the *Wool Grower and Stock Register* for May:

WE think it is quite difficult to find men who are capable of feeding cattle or other stock in a proper manner. There is generally a great deal of unnecessary waste. Some men will carry stock through the winter with half the quantity of hay or fodder that others will use, and yet the stock which has consumed least will come out in the best order. To feed economically, the animal should have just the quantity he requires and no more; none should be given to be trampled under feet and left, unless it is intended for manure. It is best, generally, to feed under cover in clean mangers, though in dry weather, coarse fodder, or that of inferior quality, may be fed in mangers in the barn yard. Coarse hay, clover and Timothy, and corn stalks, had better be passed through a cutting machine; and if some bran, shorts, or a little meal can be added, the improved quality of the whole will render it much better relished by the animals, and they will in their increased flesh or milk repay the cost.

A good food for work horses or oxen is cut hay with from three to six quarts of corn meal per day—regulating the quantity according to the degree of labor performed. Oats and corn, ground together, make a good provender. Moisten the hay, and mix the meal with it. If the labor is not severe, two quarts of meal with the hay, and the addition of a peck of carrots per day will keep the horses in good condition. The carrots are good for the blood, and will improve the horse's health. Carrots are also valuable for milch cows—increasing the quantity and improving the quality of the milk.

Rowen hay, or aftermath, is most suitable for calves and milch cows or sheep. It is almost like grass, and will produce nearly as much milk. It is likewise good for fattening animals; but for working oxen and horses it produces rather too loose a state of the bowels to admit of the muscular exertion which is required.

Young cattle and sheep will be benefited by a daily allowance of some kind of roots—potatoes, carrots, or turneps. The succulence of the vegetables will render their dry food more like grass—the most natural and proper food for such stock. January and February are the best months for disposing of the poorest fodder. While the weather is coldest, the appetite is sharpest, and articles will be eaten which, under other circumstances, would be rejected. S.

### Points of Cattle.

WE give the conclusion of Mr. RORER'S points of cattle, as follows:

HEREFORDS.—THE COW.

*Purity of Blood,* as traced back to the satisfaction of committees, to imported blood *on both sides,* from some known English breeder, or as found in Eyton's Hereford Herd-Book—40.

*The Head*—moderately small, with a good width of forehead, tapering to the muzzle; the cheek-bone, rather deep, but clean in the jaw; the nose, light in its color, and the whole head free from fleshiness—2.

*The Eye* full, mild, and cheerful in its expression—1.

*The Ear* of medium size—1.

*The Horns*—light and tapering, long, and spreading, with an outward and upward turn, giving a gay and lofty expression to the whole head—3.

*The Neck*—of a medium length; full in its junction with the shoulders, spreading well over the shoulder points, and tapering finely to the head—3.

*The Chest*—broad, round, and deep; its floor running well back of the elbows, which, with a spring fore-rib, gives great interior capacity to this all-important portion of the body—8.

*The Brisket—when in flesh,* largely developed, descending low between the legs, and deep, by covering the anterior portion of the sternum, or breast-bone, but never interfering with the action of the animal when in working condition—3.

*The Shoulder*—lying snugly and closely in towards the top, and spreading towards the points; the blade sloping somewhat back, and running pretty well up into the withers, which by rising a very trifle above the level line of the back, gives to the ox a very upstanding, and beautiful fore-end. The whole shoulder well clothed with muscle—3.

*The Crops*—filling all up evenly behind the shoulders, and blending it smoothly in with the muscles of the back—2.

*The Back, Loin, and Hips,* should be broad, wide and level—4

*The Rumps* should lie nearly, or quite level with the back, and their covering should be abundant, mellow, loose, and freely moving under the hand, thus showing great aptitude to fatten—4.

*The Pelvis*—roomy; indicated by wide hips, as already mentioned, and the space between the rumps, which should stand well apart, giving a general breadth to the posterior portion of the animal—4.

*The Twist* broad and full—2.

*The Hind Quarter*—large and thoroughly developed in its upper and more valuable portions, as beef. The thigh gradually tapering to the hock, but muscular—3.

*The Carcass*—round throughout; full and capacious, with the under line of the belly level, or nearly so—1.

*The Flank* full and wide—1.

*The Legs*—straight, upright; firmly placed to support the superincumbent weight; a strong back sinew, but by no means a large, coarse cannon bone—3.

*The Tail*—large and full at its point of attachment, but fine in its cord—1.

*The Carriage*—prompt, resolute, and cheerful; and in the ox, gay and lively—1.

*The Quality* is indicated by a flexible, soft, yet substantial skin, resting on a somewhat firm, but rich, mellow, and elastic substance, becoming firmer as the animal approaches its maximum of high condition—8.

*The Hair*—thick, close, and furry—1.

*The Udder*—should be such as will afford the best promise of capacity and product—1.

*Color.*—Reds or rich browns, oftentimes very dark, with a white or "brockled" face, are now the colors, and marking of the Hereford, though grey Herefords, or cream-color, were not uncommon—1.

Same general remarks in regard to points of the Hereford bull, as made in reference to Short-horn.

AYRSHIRES.—THE COW.

*Purity of Blood,* as traced back to importations of both dam and sire, under such evidence as will satisfy committees—10.

*The Head*—as in other breeds, small; the face long and narrow; the muzzle and nose dark—2.

*The Eye* placid and not strikingly large—1.

*The Ear* of full size and of an orange color within—2.

*The Horns* small, tapering with an outward and upward turn, and set on wide apart, the face somewhat dishing—1.

*The Neck* of medium length, clean in the throat, very light, throughout, and tapering to the head—1.

*The Shoulders* lying snugly to the body, thin at their top, small at their points, not long in the blade, nor loaded with muscle—3.

*The Chest* must retain sufficient width and roundness to secure constitution. The lightness of the fore-quarter, and the "wedge-shape" of the animal, from the hind-quarter forward, arising more from a small, flat and thin shoulder, than from any undue narrowness of the chest—6.

*The Crops* easily blend in with so thin a shoulder and prevent all hollowness behind—3.

*The Brisket* not over-loading the fore-end, but light—2.

*The Back* should be straight and the loin wide, the hips rather high and well spread—8.

*The Pelvis* roomy, causing a good breadth at what is termed the "thurl," or "round-bone," and between the points of the rumps—4.

*The Quarters* long, tolerably muscular, and full in their upper portion, but moulding into the thighs below, which should have a degree of flatness, affording thus more space for a full udder. The flank well let down, but not heavy—6.

*The Ribs,* behind, springing out *very* round and full, affording space for a large udder which by Ayrshire breeders is considered very essential to secure the milking property; the whole carcass thus acquiring increased volume towards its posterior portion—4.

*The Rumps* nearly level with the back projecting but little—2.

*The Tail* thin in its cord, of full length, light in its hair, and set somewhat further into the back than would be admissible with some other breeds—1.

*The Legs* delicate and fine in the bone, inclining to be short, and well knit together at the joints—1.

*The Udder* in this breed is of more especial importance, as the Ayrshires have been bred almost exclusively with reference to their milking properties. The great feature of the udder should be capacity without being fleshy. It should be carried squarely and broadly forward, and show itself largely behind. As it rises upward it sho'd not mingle too immediately with the muscle of the thighs, but continue to preserve its own *peculiar* texture of skin—thin, delicate and ample in its folds. The teats should stand wide apart and be lengthy, but not large and coarse—6.

*The Handling* will show the skin to be of medium thickness only, moving freely under the hand and evincing a readiness in the animal to take on flesh when a drain on the constitution is no longer made by the milkpail—4.

*The Hair* soft and thick, in the phrascology of the country, wooly—1.

*Color, varies*—a dark red—a rich brown—a liver color, or mahogany, running into almost a black; those very much broken and spotty at the edges on a white ground are the favorite colors at the present time. The light yellow is, however, a color sometimes found on very good cows, but these pale colors are objected to from an impression that such belong to animals of less constitution—1.

*Carriage* should be light, active, and even gay; this latter appearance is much promoted by the upward turn of the horn—1.

Same general remarks in regard to points of the Ayrshire bull, as made in reference to Short-horn.

# Orchard and Garden.

## VEGETABLE SECRETIONS.

VEGETABLE SECRETIONS may be defined as the "separation of a peculiar matter, from the general mass of fluids by some particular structure, and which may either retain its fluid state, or become solid."

How wonderful are the processes that bring about such widely different results, though to the eye and the other organs of sense, the mass of fluids may seem identical and the secreting organs appear to be in the same condition. The essential oil of the orange is secreted in the rind. The almond secretes its fatty oil only in the kernel of its fruit. So with the walnut, butternut, &c. The astringent principle, so useful in the manufacture of leather is, secreted by the oak, hemlock and some others in the bark. The peach secretes its prussic acid in the leaf and the kernel of its fruit. So with most of the secretions; they exist only in certian parts of the plant, and among these secretions may be found acids, alkalies, earths, and even minerals. Chemists number some forty or more products of vegetation, that possess distinct chemical qualities. Of these there are numerous combinations, so that there are many chemical varieties of the products of vegetable secretions.

These chemical combinations display such an infinity of wisdom, that the comprehension of man is too feeble to fully grasp the subject and fathom its mysteries. Who can explain how it is that the simple elements of oxygen and nitrogen shall, in one proportion constitute the air which supports all life, and in another proportion the deadly nitric acid? So the same elements may in one form be our food, and in another our poison. The same elements may form different substances, of marked difference of qualities, and yet vary but slightly in their proportions. Thus gum arabic, dried starch, crystalized sugar, and lignin from boxwood have been found to vary but a little in the combination of their elements.

But the most remarkable of all the vegetable secretions, is the mucilaginous fluid termed cambium, which, without much stretch of fancy may be considered, in its office to the vegetable as analogous to the chyle of the animal system. However much color and taste the proper juice of the plant may possess, the cambium elaborated therefrom, is void of them all. The former flows, or passes through the proper vessels of the plant upward to the leaves, where it is elaborated into the latter, and thence is passed downward, where it transudes to supply the waste of nature or add to the growth of the plant. Thus it is from the saccharine juice of the maple, the resinous juice of the pine, cambium is formed which makes the wood and bark of their respective species. The cambium, white in all plants, transudes beneath the bark, the most of it going to form a new layer of wood, the remainder to keep up the waste of bark.—While this process is going forward and the depositions of cambium are being made, the bark readily separates from the wood, but, as the cambium solidifies and forms the new layer, or circle of wood, the bark adheres again. As the yearly accumulations increase, the outer bark, which has become dead or lifeless is cracked, and hence the jagged appearance which the barks of most of our aged forest trees present. A few trees like the American Sycamore, annually cast off their dead circles of bark.

Nurserymen and others take advantage of this working of natures laws, and, while the deposition of cambium is going forward, make incisions through the bark and insert a freshly cut bud, when the cambium readily unites the inserted bud to the stock and it flourishes with as much vigor as the natural buds. The insertion of scions, by grafting, is on the same principle, though the latter may be done when there is no separation of bark. The union of the barks of the two parts being necessary, that there be a connection of vessels,—so soon as the leaves expand on the scion and commence their functions, cambium may be elaborated sufficiently to cement the union and make the two indissolubly one. Hence it is that man, by his observation, has brought nature to bear upon his interests and aid him in converting worthless products into those of the best quality.

The most of the vegetable secretions are carried on at, or near the surface, and are found in the leaves, the flowers, the bark, fruit, &c. Their products are very diversified and calculated to please the eye, the taste, or the smell, and be of great practical utility in medicine, in the arts, or as food for man and beast.

---

BITS of refuse wool tied to the stems and stalks of dahlias, are said to be an effectual preservation against earwigs, and a less unsightly one than pots on sticks.

## MANAGEMENT OF ORCHARDS.

THE management of orchards is a matter of no trival importance to this country at the present time. Thousands of acres of the best land are planted with fruit trees, and a large amount of capital has been expended in their purchase and planting, and whether this land has been rightly appropriated, and this money judiciously expended, depends entirely upon future management. Many people have embarked in this as in other pursuits, with spirit and enthusiasm. They prepare their ground, plant their trees, take good care of them probably for a year or two, until their enthusiasm begins to cool, when some new hobby is taken up, and the orchard is lost sight of, probably "seeded down," and left to take care of itself with the occasional assistance of cattle, sheep, or hogs, that may be turned in to pasture among them. Thus "seeded down," and cropped, and bruised, and barked by animals, starved for the want of suitable and sufficient nutriment, the trees become stunted, mossy, covered with insects, and, in short, a nuisance. * *

* * WE must beg of cultivators not to entertain for a single moment the ruinous practice of "seeding down." If you think you cannot afford it, or that it will not pay to give your orchards good clean culture until they have at least attained a full bearing condition, dig them up and burn them, and convert your land at once and completely into corn fields or pastures, as it may seem fit. You may rely upon it, that you cannot have a more unprofitable or discreditable piece of property than a starved, neglected fruit tree. How is it possible that a young tree can thrive in a pasture or tough sod? The young roots near the surface of the ground that are really the most important as furnishing the better portion of the food of the tree, are robbed by the grass and weeds, and die out, leaving the tree to find its entire support through the deep roots that are bedded in the poor, cold subsoil. In such a situation, a tree immediately looses its vigor.—It begins to look feeble, old and knarly, fungi and insects take possession of it, and there it ends.

It is surprising to people who have not observed very closely the results of various modes of culture upon trees, how soon young trees show the influence of plants growing around or near their roots. A few years ago, in an economical mood, we sowed carrots between some rows of young apple trees. The rows were 3½ feet apart, and we sowed only one row of carrots in the space—the ground, too, was kept clean all summer, and yet we lost the season's growth of the trees, and got a poor crop of carrots.—Other trees of the same age, in the same soil *without* crrrots, were twice as large in the autumn. That ended our carrot culture among trees. When an orchard is cropped, the greatest care should be taken to give the tree ample room. If the nutriment be drained from around the roots by the rapid growth of annual crops, or if the tops be excluded from the free circulation of the air and exposed to the sun, the result will be a feeble, sickly growth.—*Genesee Farmer.*

## MIXING SEEDS.

FEW farmers are aware of the difference in the market value of an article pure in its kind, and a mixture of two or three kinds, each of which, separately, would be as good as the pure article. For example,—the small white bean and the long white, or Shaker bean, if in equal quality and condition, vary very little, if any, in price. But mix them half and half and you reduce the price one or two shillings per bushel, as ordinary market beans, and throw them out of the market as a seed bean. But this is not the worst thing. If you plant one pint of some colored bean, or some late bean with a bushel of pure long white, or with the early China, or the round marrow, they will be green when you harvest the other, and will be soft when you thresh them, be dirty, mashed, and probably mouldy when you sell them, and will injure the sale of your crop twice the whole cost of the seed.

And this injury is not a fancy or notional concern. The long white and the marrow are both beautiful, valuable beans. They look well in the basket and well on the table, and sustain well the sealing test, the palate of the lover of baked pork and beans. But if you mix them, the marrow bean in cooking, will become soft and fall in pieces, while the other is but half cooked. So that it is impossible to cook the mixture and bring it to the table in prime order.

The general rule, although it has many exceptions, is that the mixture takes the grade of the cheaper ingredients. If you mix Carter potatoes and English whites together, half of each, the price will be reduced very near the standard of the least valuable.—They can never be sold on an order for Carters, and the chance of sale at a price above the lower grade is limited to a bantering bargain, face to face with the buyer.

The same is true with almost every article. The pure, prime article commands a sale and commands a price. The mixture begs a purchaser and begs a price. The dealer who stands between the producer and the consumer barely pays a price satisfactory to the producer, and yet finds it hard to secure from the consumer a fair percentage for his labor. "It is not what I wanted," says the consumer; "I will give you so much and no more."

As the planting season is at hand, we ask the attention of our farming community to this subject. We are very confident that those who regard this matter in its true light, will find their reward, while those who consider it "all a notion" will say, "we can never get what our things are worth."—*Cult. & Gazette.*

---

HE who thinks too long will never do much.

## THE NEW-ROCHELLE BLACKBERRY.

MR. LAWTON states that one of his neighbors discovered, some six or eight year ago, a bunch of blackberry vines by the side of the road, of different quality from the common high blackberries and so much superior that he was induced to transfer them to his garden. From this small beginning they have been propagated as much as possible. Mr. Lawton first obtained them in 1848.—It is his intention to set ten acres as soon as he can get the plants. He stated that the stalks exhibited had been headed back, so that it resembled a bush about four and a half feet high, with a spreading head, which he presumed, from his knowledge of the general yield, had borne a gallon of fruit.

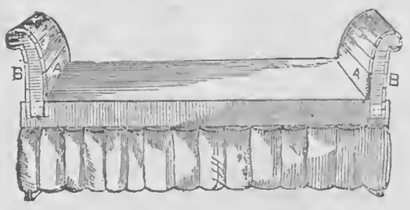
The character of these berries is very unlike the fruit of the common high blackberry vines, which is long and full of seeds, while the new variety is nearly round, very pulpy, the pips being large, in which the seed are entirely hid from view. He stated that he had measured many berries that were three inches round; that the general size and shape were as near like Hovey's seedling strawberries as anything he could compare them to. The flavor of the fruit is sweet and rich to a remarkable degree, and vines long-bearing. His first crop ripened July 28th, and continued till the second week of September. The next August 4th, and continued four weeks. Last summer, owing to the great drought, they only continued about three weeks in full bearing. The vines will grow almost equally well in shade as in open ground, and if an opportunity is given, will climb twenty feet into a tree.

Mr. Lawton sold his berries last summer, to a New York dealer, for ten cents a basket—equal to about twenty-five cents a quart—the buyer picking them himself. It is the opinion of Mr. Lawton that this is an entirely new variety of the blackberry, and besides the greater value of the fruit, they bear garden culture much better than the other or common variety. The demand for new plants is greater than can be supplied at present, at moderate rate; the price now is fifty cents.—*Vt. Chronicle.*

---

"A FARMER'S DAUGHTER," in the Maine Farmer, says the common poppy, growing among the onions, will prevent attacks of the worm. When the poppy plants become too numerous or strong, pull them up and leave the uprooted stalks on the bed.

# Domestic Economy.



## A CHEAP AND HANDSOME SETTEE.

MR. MOORE:—Above I give a plan for a settee, which though imperfectly represented, may give you an idea of what I mean.—It consists of a rough board bench, that any one with a moderate share of ingenuity can construct. This being done, take inch boards and shape them for arms—four of them as represented at B, B, in the engraving; then take two strips of the same board, A, A, perhaps four inches wide, and nail on the arms, letting them in half an inch, by cutting that depth into the arms, though this is not shown by the picture. Now cover the remaining part with half-inch stuff which will conform to the curvature. It is a better way to make these ends separate and then attach them to the bench.

The whole is designed to be covered, hence it is not necessary to be very particular in its construction, only to make it strong.—The plan is one in which cheapness and beauty are combined, making a good substitute for a couch or chair. It may not be a new thing to many, but I never have seen one like it. Yours, truly, L. G. B.

## RHUBARB PIE.

CUT the large stalks off where the leaves commence; strip off the outside skin, then cut the stalks in pieces half an inch long, line a pie dish with paste rolled thicker than a dollar piece, put in a layer of the rhubarb nearly an inch deep; to a quart bowl of cut rhubarb, put a large tea-cup of sugar, strew it over with a spoonful of salt, and half a nutmeg grated; cover with a rich pie crust, cut a slit in the centre, trim off the edge with a sharp knife, and bake in a quick oven, until the pie loosens from the dish.

Rhubarb pies made in this way are altogether superior to those made of the fruit stewed.

---

WILL some of our female friends try good molasses instead of sugar for Rhubarb pie, and let us know whether it is not better?—We have been told that molasses is better than sugar—and we know that for some purposes it is. For instance, when cider and water are sweetened, molasses is the article in preference to sugar.—*Mass. Plowman.*

---

BROILED POTATOES.—Cut cold boiled potatoes in slices lengthwise, quarter of an inch thick; dip each slice in wheat flour, and lay them on a gridiron over a bright fire of coals; when both sides are browned nicely, take them on a hot dish, add a bit of butter, pepper and salt to taste, and serve hot.

# Mechanic Arts, &c.

## LIST OF PATENT CLAIMS

ISSUED FROM THE UNITED STATES PATENT OFFICE

For the week ending May 17, 1853.

Thos. A. Chandler, of Rockford, Ill., for Improvement in Pendulum Levels.

Moses Coburn, of Savannah, Ga., for Improvement in Violins.

Edwin Forbes, of Boston, Mass., for Improvement in Vertical Pianos.

Samuel Fox, of (near) Sheffield, England, for Improvement in Umbrellas and Parasols. Patented in England, April 6, 1853.

Lewis L. Gilliland and Joseph R. Wagener, of Dayton, O., for Improvement in Sofa Bedsteads.

John H. H. Hawes, of Ithaca, N. Y., for Improvement in Calendar Clocks.

Matthias Heim, of Cincinnati, O., for Improvement in Cooking Stoves.

Abner H. Longley, of Lebanon, Ind., for Improvement in Machines for Cutting Wooden Screws.

Fred'k Mathesius, of New York, N. Y., for Improvement in Upholstering Furniture.

Julius A. Pease, of New York, N. Y., for Improvement in Seeding Hoes.

Wm. J. Thorn, of Westbrook, Me., for Improvement in Pocket Combs.

Wm. W. Wade, of Springfield, Mass., for Improvement in Castors for Furniture.

Halsey D. Walcott, of Boston, Mass., for Improvement in Graduated Cutters for Cloth and other substances.

Davis L. Weatherhead, of Philadelphia, Pa., for Improvement in Cleansing and Cooling Block Dies in Rivet Machines.

Samuel J. Seely, of New York, N. Y., for Improvement in Lime Kilns.

Wm. F. Ketchum, of Buffalo, N. Y., Assignor to Rufus L. Howard, of same place, for Improvement in Track Clearers to Harvesters.

Richard Montgomery, of New York, N. Y., Assignor to Elizabeth Montgomery, of same place, for Improvement in Cowugated Plates for Steam Boilers, &c. Foreign patent, date Feb. 17, 1853.

James A. Woodbury, of Winchester, Mass., Joshua Merrill, of Boston, Mass., and Geo. Patten, of Charleston, Mass., for Improvements in Air Engines. Patented in England, Jan. 5, 1853.

Wm. Cressler, of Shippenburg, Pa., for Improvement in Seed Planters.

## NEW CARRIAGE SPRING.

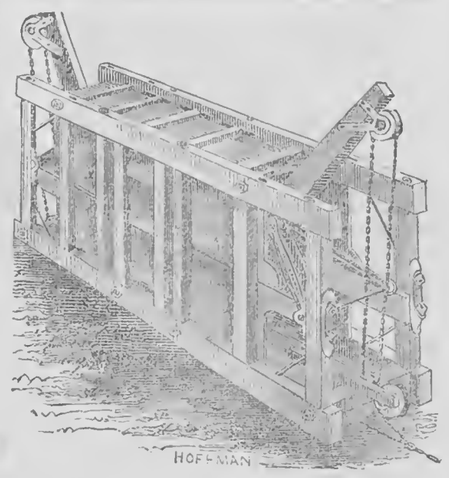
A CARRIAGE spring of a novel construction by which the vehicle is allowed to have a free and easy vertical motion, and at the same time prevented from any side-swinging, has been invented by Nelson N. Titus, of Cherry Valley, N. Y., who has taken measures to secure a patent. It consists of a spiral spring wound round a spindle that passes vertically through a barrel, in which the spring is encased, and likewise through a drum on which the straps, by which the apparatus is connected with the carriage, are secured, the spring and its attachments thus serving to sustain the carriage, and regulate its action according to the burden. To effect this latter purpose the spindle is made square at the lower end to which a key can be fitted for winding up the spring, so that its tension may be proportional with the weight that it has to support. The spring is likewise kept to its required position by means of a pawl which catches into ratchet teeth on one of the flanges of the drum, and there is a similar contrivance on the other flange to prevent the drum from turning with the spindle, which can only be done by disconnecting the pawl from its place.

## ORNAMENTAL LETTERS FOR DOOR PLATES.

C. L. OSBORNE, of New York city, has taken measures to secure a patent for an improvement in articles of this description.—The nature of the invention consists in a novel combination of stained glass, with a mirror, for the purpose of representing, with a peculiar effect, letters, figures, and ornamental devices suitable for door-plates, signs, and similar articles. The stained glass employed is of that description which is only stained on one surface, and on this surface is engraved such letters, figures, or other devices as are desired, to such a depth as to remove the stain entirely from the glass; behind the glass so engraved is then placed a mirror. The effect produced is, that when the plate is viewed in any position except that perpendicular to the line of vision, the reflection of the devices engraved is seen on the mirror through the colored part of the glass, which appears illuminated, and the reflection of the colored portion of the glass is seen through the colorless or engraved portion, and presents a very peculiar and beautiful appearance.—*Scientific American.*

---

PREVENTOR CARS.—There should be no such thing as railroad collisions. There is no excuse for them. If conductors and engineers would rigorously adhere to proper time tables, and if every road were properly policed by a sufficient number of men to thoroughly watch the track, collisions would be nearly impossible. But if it is the purpose of railroad managers and engineers to continue to run trains hap-hazard as of late, we suggest that two, or three, or four preventor cars be placed on the train between the baggage and passenger cars. They might be stoutly constructed, and by means of a stuffing of cotton, or the use of Indian rubber, or some other elastic substance, be made a perfect protection to the passengers in case like the late catastrophe near Chicago, or the more recent deplorable plunge at Norwalk.—*Tribune.*



## EMERY'S PORTABLE HAY PRESS.

THE above cut represents the external view of H. L. EMERY'S Portable Hay and Cotton Press, manufactured and sold by Emery & Co., Albany, N. Y. As seen in the cut, it is closed up, and about midway in process of pressing a bundle of hay. When fully pressed, the ends of the levers which are seen at each end extending above the box, are brought down by the chains and shelves until the levers themselves are in a horizontal position.

The press is provided with two followers, both working from the ends towards the center, and each other. The chains or ropes from the levers are connected by passing one of them under the press, and joining in a larger chain or rope; this larger one connected with a capstan, or blocks and ropes, as is preferred, or most convenient.

When the press is driven home, the hay becomes pressed into a bundle, standing on end; the side doors are thrown open, while the bands are pressed round the bundle and secured; when the followers and top doors are loosened, and the bundle thrown out.—For operation, the levers are raised and the followers drawn back, and the top opened by means of two doors, which are buttoned down in the center by a crossbar, as seen in the cut. The opening on the top for receiving the hay, is two feet wide and eight feet long. The press stands on the ground or floor when in use, which makes it both convenient and capacious for filling and treading in the hay.

The whole press is fourteen feet long, two feet ten inches wide, and four feet ten inches high, outside measurement. It weighs about twelve to sixteen hundred pounds, and is capable of compressing two hundred and fifty pounds of timothy hay into sixteen cubic feet, at the rate of five bundles per hour, with two men and one horse; and heavier bales in proportion, as to size and time. Price complete with chains and capstan, is $136, and warranted to give satisfaction.

---

INDIA RUBBER TEETH.—This article, in the form of purified white India rubber, has been patented in England, for making artificial teeth, gums, and palates. By its adoption many advantages hitherto impossible to be attained, have been introduced. The adhesion is complete; it can be moulded with perfection, to suit every inequality of the gums and teeth, and supplies an artificial periosteum, as it were, to the teeth, when they become painful by the wasting away of the gum. Added to these is the elasticity of the material, which completely obviates the inconveniences that arise from any motion with artificial teeth as made by other means.

---

DETECTING FALSE COIN.—A certain Dr. Gideon B. Smith has invented a very novel and ingenious contrivance for detecting spurious coin of the gold dollar stamp. It is a small box with a slit in the lid, which will admit the genuine coin only. If a spurious coin passes through the slit, it will not sink, because it is resisted by a weight inside, superior to the leverage by which the true coin overpoises the weight. And if the spurious coin is made so large that its weight equals the true coin, it will not pass thro' the aperture. The article might be made to sell at a low price, and thus come into general use.

---

A WARNING.—A singular death occurred in Paris recently. A gentleman, feeling a slight itching in his ear, took up a friction match in order to dispel it. In the arder of a conversation he was sustaining, he introduced the sulphurous end. The contact soon produced ignition, and the downy lining of the ear caught fire; a portion of the sulphur adhered to the flesh, and burnt there, persistently. The unfortunate man never spoke again. His sufferings were so agonizing that his tongue became powerless; and, after two days torment, and unavailing efforts of the surgeons, he died.

---

A GREAT deal of embroidery on muslin is now done by machinery; about one hundred and thirty needles are worked by a grown person and two children. The machine copies the pattern by means of a pentagraph, and costs about £200.

---

A SYPHON for dairymen is now in use in Scotland, by means of which the milk is drawn away from the cream, instead of skimming the cream off the milk.

---

IT is useless to attempt to reason a man out of a thing he was never reasoned into.

# Educational.

## THE INFLUENCE OF EXAMPLE.

In a certain village in Switzerland, some years ago, there were heavy complaints among all who possessed trees, that no fruit was safe; that the children plundered it perpetually, before it came to maturity; and not only that, but that the green saplings had no better security against them. Another serious complaint was the barbarity of the children toward all living creatures in their power.

The clergyman, teacher and elders often laid their heads together to find some remedy for this inhuman spirit, by which every child in the place was more or less affected. They could not conceive why such a spirit should prevail so specially in this village; but they could find neither cause nor remedy; all exhortations, all punishments were in vain. The clergyman of the village was changed; and the new minister was a great friend to schools. His first walk was to the school-house. The vice of the scholars had been made known to him, and the failure of all preventative measures hitherto applied. But, determining within himself to watch the whole course of proceedings in school, he soon perceived that the teacher had a habit, and had acquired a singular dexterity in it, of knocking down and killing flies with his cane, to the end of which he had fastened a piece of leather. The windows were all on one side, and being exposed to the morning sun of summer, they were continually full of flies. The teacher's path lay along them, in front of the scholars; and while talking to the latter, he struck down the flies as fast as they showed themselves at the window.—This manœuvre amused the children infinitely more than his instruction did, and they followed his example. They were incessantly on the watch for flies that buzzed through the room, caught them in their hands, and showed as great dexterity in this kind of chase as their teacher did in his.—But their amusement did not end here; they had learned to play with their captives, treat them with detestable cruelty, and seemed to find a wicked delight in observing the shivering of their victims.

On observing these curious and far from pleasing peculiarities of the school, the intelligent and humane clergyman easily accounted for the spirit of destructiveness among the children: and his first step was to induce the teacher to take his leather from the end of his cane, and next to turn the desks so that the boys sat with their backs to the windows, and the teacher's path lay on the other side of the room. Then the minister went frequently into the school, and examined so severely, that both teacher and pupils had more to do than to give their attention to the flies. As this was not yet entirely satisfactory in its results, the minister took advantage of the hot summer weather to have instruction given only in the afternoon, when the school was not so full of flies, and thus he gradually banished the insects from the thoughts of teacher and children. But he know that it was of little avail solely to pull the weeds out of young minds. He obtained an unoccupied piece of land fit for planting, and, not far from the school, laid out a school-garden.—This pleased the teacher, and the children willingly took part in the task, for they had soon learned to like their new minister, who came and worked among them. The garden was surrounded by a hedge planted with trees and shrubs, and each child had a tree or shrub given him to take care of. A nursery was soon laid out, and provision made for plenty of larger gardens and orchards in the village. And, behold! the spirit of destructiveness among the children soon passed away; and every man's fruit and garden became safe, the youths even begging of their parents that trees might be planted in the fields for them to take care of. The new spirit was communicated from children to parents, till it spread throughout the entire village. Every family had its pretty little garden, an emulation in cultivating flowers sprang into existence, idle and bad habits disappeared, and gradually the whole place was a scene of moral as well as physical beauty.

This incident, the truth of which can be vouched for, has been communicated to us by a lady of rank, who happens to have lately become acquainted with the circumstances, and has thought that their publicity might be advantageous. We have no doubt of the fact, that the practice of amateur gardening is never associated with evil, but is always a token of advanced tastes and correct habits. Let every one, therefore, within his own sphere do what he can to promote this most desirable pursuit. We would further say, let every school, so far as it can conveniently be done, have its garden, not only for purposes of amusement, but as an important engine of education.—*Chamber's Edin. Journal.*

## MISTAKE OF AMERICAN YOUTH.

It is a grand mistake into which many American youth fall, that *manual labor is not honorable.* To be a merchant, a lawyer, a doctor, an engineer, a military or naval officer, or a ship master, is, in their esteem, much more honorable than it is to be a mechanic or a farmer. It cannot be denied that all these other occupations require exertion. The doctor is oftentimes quite as weary when his day's work is done, as the farmer and blacksmith can be; but he is not half so sure of a quiet night's sleep as they are, and we all know to what hardships engineers are exposed, as well as persons who follow the seas.

We often see vigorous young men seeking places as clerks in stores. They all hope for (and generally expect) some favorable tide in the affairs of life, which "will lead them on to fortune."

"Other men have accumulated vast sums of money in buying and selling goods, why not I?" is the language they use. They rarely consider that but a very small number of those who embark ever complete the voyage. Where one succeeds, ten, fifty, perhaps a hundred, fail.

But an industrious, thrifty farmer seldom fails to secure for himself and family the common comforts of life. The skillful and practical mechanic, too, is generally sure of a remuneration for his labor, and, with common prudence, he can provide a competence for the future. That princely fortunes can be heaped up by handling the plow, the jack-plane, or the sledge, we do not say; nor is it pretended that men are as likely to acquire fame on the farm or at the work bench, as at the bar. But the history of the world will show, that the men who have done most for the welfare of their race, and whose memories are cherished with the most respect, came from the hard-working ranks. Princely fortunes are more easily wasted than won, and while the more moderate possessions of the farmer or mechanic supply all the comforts of life, they are attended with few temptations to luxury or extravagance, and still fewer risks from the folly or fraud of others.

There can be no doubt that agricultural employments are the most natural to men, and there is no country on the globe in which the facilities for pursuing these employments are as great as in the United States. It requires but a very small outlay of money to obtain a respectable farm to begin with. A good knowledge of the methods of husbandry can be easily acquired.—The implements of labor are as good and as cheap as can be found the world over. The products of the earth are sure of a good market, and one which is easily reached.—The title of the land is well secured, and large monoplies, such as some of the countries of the Old World are burdened with, can never exist here.

The farmer—that honest, goodly farmer—is one of the most independent men in the wide world. He has the promise of the Great Creator that seed-time and harvest shall not fail. He may always plow in hope and reap with joy. To till the earth, then, is really an honorable—a noble calling.

But it does not require that a man should be enslaved to the plow, nor that he should make companions of his sheep and oxen.—The shrewdest and most intelligent men who sit on our juries and help make our laws, come from their farms, and return to them as soon as their public duties terminate. The good sense, sobriety, contentment, industry, and love of order, which characterize our American farmer, are (under God) among the most important safeguards of the public peace and prosperity.

## A HINT TO RISING STATESMEN.

"One reason," says a writer in the *Boston Transcript*, "why the South has taken almost all of the Presidential nominations has been that her politicians are better cultivated, socially, than ours, and are making capital with the leaders, at Washington, in the drawing-room and at the dinner table, while our Northern politicians are spending all of their force making long and eloquent speeches. There is great influence in speeches and orations undoubtedly; but there are times and seasons when smiles and oyster-sauce make a greater impression." Elsewhere the writer observes:—"The true secret of Mr. Clay's undying popularity was, that his manners were so genial and engaging that those who had once approached him never forsook him. So, too, Mr. Calhoun's magical influence in South Carolina may be traced mainly to the same cause. All who were honored with his acquaintance always loved him. One of our citizens, who happened at one time to be in Charleston, S. C., when Mr. Calhoun arrived there from Washington, and saw how the citizens gathered around him, and witnessed the frank, easy and natural manner with which all classes saluted him and entered into conversation with him, without form or introduction, was quite amazed, it was so different from anything he had seen north." The same writer expresses the opinion that Daniel Webster would have reached the Presidential Chair, if his manner had been more gracious.

## THE QUINTESSENCE OF LEARNING.

There was once in a certain part of India such a voluminous library, that 1000 camels were requisite for its transport, and 100 Brahmins had to be paid for the care. The king felt no inclination to wade through all this heap of learning himself, and ordered his well-fed librarians to furnish him with an extract for his private use. They set to work, and in about twenty year's time they produced a nice little Encyclopædia, which might have been easily carried by thirty camels. But the monarch found it still to large, and had not even patience enough to read the preface.

The indefatigable Brahmins began therefore afresh, and reduced the thirty cargoes in so small a substance, that a single ass marched away with it in comfort. But the kingly dislike for reading had increased with age, and his servants wrote at last on a palm leaf: "The quintessence of all science consists in the little word, *perhaps!* Three expressions contain the history of mankind; they were born; they suffered; and they died. Love only what is good, and practice what you love. Believe only what is true, but do not mention all that you believe."

We should not forget that a leading element in the life and power of a scholar, consists in original inquiry probing, delving through such passes of the mind, as will dissect the members of any question—as will analyze the parts of any great truth.

# The Essayist.

Written for the Rural New-Yorker.

## THE MIGHTY DEAD.

Who is able to sing the requiem, or to pronounce the eulogy, of the mighty dead? Shall man attempt their praise and strive to give them honor or fame? The task is fertile. The laurel wreath has long been worn, and still their great actions, in never-dying goodness, are winning boughs of palm. Can, then, the living add one ray to their glory, or make its lustre brighter?—We may strive to bless their deeds in the imitation of their lives, and thus win some share of the goodness that blessed them with fame and glory. And still will the lustre of their goodness grow brighter, and ages after us rise up to call them blessed.

But what should make the dead so mighty? Like us they once had bone and flesh and blood; and walked the earth; had their cares, perplexities and crosses; were subject to pain, disease and death; and like other human clay were mingled with their mother earth, and from dust returned to dust. Then *why* should we bow to dust and call it great? If this is the law of sense, why not take a grain of sand, enshrine it in an urn and call it great? But if it had ever a soul that wrought out mighty deeds, deeds of truth, virtue, high renown, it might well be called great, and enrolled with the mighty dead.

The bulk of stature does not insure to man greatness, nor does the brawny muscle make him mighty. The man who is strong and plays the tyrant, is feared and hated, and "damned with faint praise," till death, a greater tyrant, bears him off, while the memory of his name rots on earth. Such men find no place among the mighty dead. The conqueror, who sends up the smoke of ruined cities, who wades through fields of blood and strides o'er fallen hosts of dead and dying, is not great. His fellow man may shout his name in fulsome adulation, and cry he *is* a God. It is in vain. A widow's prayer or an orphan's wail will blast it all. Nor is he great who counts his cash by millions; who wears his robes of purple, dyed by the life's blood of the widow and fatherless; who daily fares sumptously on the richest viands that pampered taste can crave; who bows to mammon, and is not loth to sell his soul for paltry yellow dust.

What then makes the dead so mighty, if neither wealth nor power nor strength constitutes their greatness? The soul, we answer, imbued with truth and virtue—that spirit given by God to man, and which lives eternal. If disease but lift a finger, the robust form of strength fades, and vaunting power yields the strife to death, whilst wealth takes sudden wings and flies away.

Not so with virtue. Its deeds live while time lasts, and then it unbars the gates of Heaven. The man thus thoroughly imbued may do a noble action or deed, and lay his body in the grave; but think not he shall live no more. As a pebble dropped in the placid lake gives rise to circling waves that spread themselves unbroken to the farthest shore; so a virtuous deed shall live, and with each succeeding year grow greater, till at last it merges in eternity. It is thus they hold a power beyond the living.

By this means the name of Washington became embalmed in the memory of the world, and his goodness enshrined in the hearts of his countrymen. So by virtuous deeds in Liberty's cause, Tell and Lafayette, and other brave spirits rest among the truly mighty dead. The names of Howard, Luther, Shakspeare, Milton, Columbus, and of many others, from the patriarch Abram, down, might be pointed out and their deeds be recounted by the virtues which still wield a potent influence on the living, while they have long slept with the mighty dead.

But such is not the purpose of this article. We see and know that some have breathed and moved for a brief space of time in the flesh, and then have gone the way of the earth, and still they live by their undying actions and are held in admiration, love and reverence. We may know the reason why they are thus embalmed in glory and renown. The secret of their rise, is virtue, working out the deeds of truth. And almost are they canonized. It is well—but not to worship.

If there is one who has the lofty aspiration to live that life of goodness and of greatness, let him choose for his model him who seems the greatest. Hold his goodness up before your gaze, guide your feet by the inspiration of Holy Writ, and, when time shall be no more with you, you may have won your place also among the mighty dead.

The sea is filled by tributary streams, which take their rise from gurgling springs and falling drops of water. So living character must be formed. Not by some wondrous gift of fortune, some *one* great action, but by an even tenor of way, a daily conquering strife. No idle hand has power to pluck the laurel wreath. Nor yet did ever prayer of sluggish heart rise to heaven to bring back an answering echo. So, if you wish success to crown your effort, you must toil, toil from morn to night and from night to morn, and never shrink from trouble, for he who would bear the full grown ox must, Milo like, daily lift the growing calf.

T. E. W.

## WALKING.

Walking is good; not stepping from shop to shop, or from neighbor to neighbor, but stretching out far into the country to the fresh fields, and highest ridges, and quietest lanes. However sullen the imagination may have been among its griefs at home, here it cheers up and smiles. However listless the limbs may have been when sustaining a too heavy heart, here they are braced, and the lagging gait becomes buoyant again. The mere breathing of the cool wind on the face in the commonest highway is rest and comfort which must be felt at such times to be believed. It is disbelieved in the shortest intervals between its seasons of enjoyment; and every time the sufferer has resolution to go forth to meet it, it penetrates to the very heart in great surprise. The fields are better still, for there is a lark to fill up the hours with mirthful music, or at worst the robin and the flocks of field-fares to show that the hardest day has its life and hilarity. But the calmest region is the upland, where human life is spread out beneath the bodily eye—where the eye moves from the peasant's nest to the spiry town, from the school house to the church yard, from the diminished team in the patch of fallow, or the fisherman's boat in the cove, to the viaduct that spans the valley, or the fleet that glides, ghost like, on the horizon.—*Miss Martineau.*

## "FATHER IS COMING!"

We think Fanny Fern never wrote a better pair of paragraphs than the following, from the Olive Branch:

Look on this Picture, and then on that.—"Father is coming!" and little round faces grow long, and merry voices are hushed, and toys are hustled into the closet, and mamma glances nervously at the door, and baby is bribed with a lump of sugar to keep the peace; and father's face relaxes not a muscle; and the little group huddle like timid sheep in a corner, and tea is despatched as silently as if speaking were prohibited by the statute book, and the children creep like culprits to bed, marvelling that baby dare crow so loud, now that "*Father has come.*"

"Father is coming!" and bright eyes sparkle for joy, and tiny feet dance with glee, and eager faces press against the window-pane, and a bevy of rosy lips claim kisses at the door, and picture-books lie unrebuked on the table, and tops and, balls, and dolls, and kites are discussed, and little Susy lays her soft cheek against the paternal whiskers with the most fearless "abandon," and Charley gets a love-pat for his "medal," and mamma's face grows radiant, and the evening paper is read (not silently but aloud,) and tea and toast, and time vanish with equal celerity, for jubilee has arrived, and "*Father has come!*"

## THE FISH AND RING.

One of the emblems in the coat of arms of the city of Glasgow, is a fish with a ring in his mouth. It is derived from the following legend:

Many years ago an aged gentleman married a young girl. The aged gentleman became jealous of his wife without cause, accused her of coquetry, and made her and himself unhappy by his continual complaints.

On a certain occasion, while crossing one of the bridges he was upbraiding her for what he called her flirting propensities; when she, in a fit of disperation, drew the marriage ring from her finger, and dropping it into the stream, exclaimed: "If I am virtuous and true, this ring will come back to me."

A few days after, the aged gentleman purchased a salmon in the market, and carried it home for his dinner. The cook on preparing the fish for the table, found the ring in its stomach, thus proving the virtue of the young wife. From this circumstance the city of Glasgow adopted the fish and the ring in its coat of arms, as an emblem of fidelity.

## JERUSALEM AND ROME.

Bayard Taylor, in his letter describing the "Holy City," says of it:—"Jerusalem, internally, gives no impression but that of filth, ruin, poverty and degradation. There are two or three streets in the western or higher portion of the city which are tolerably clean; but all the others, to the very gates of the Holy Sepulchre, are channels of pestilence. The Jewish Quarter, which is the largest, so sickened and disgusted me, that I should rather go the whole round of the city walls than pass through it a second time."

"Nowhere but in Rome," writes Mr. Thompson, "have I seen the body of the people living in such poverty, such squalor, and such dejection. One looks almost in vain for the respectable middle classes.—These are in prison, in exile, or have perished on the scaffold or the field of battle.—Cardinals ride in unrivalled state, but the streets are filled with soldiers, priests and beggars."

The ground is hollow where tyrants tread.

# Sunday Reading.

## IMMORTAL HOPES.

Oh, what were life,
Even in the warm and summer-light of joy,
Without those hopes, that, like refreshing gales
At evening from the sea, come o'er the soul,
Breathed from the ocean of eternity!
And oh! without them who could bear the storms
That fall in roaring blackness o'er the waters
Of agitated life! Then hope arises
All round our sinking souls, like those fair birds
O'er whose soft plumes the tempest has no power,
Waving their snow-white wings amid the darkness,
And willing us, with gentle motion, on
To some calm island, on whose silvery strand
Dropping at once, their silent pinions fold,
And, as we touch the shores of Paradise,
In love and beauty walk around our feet. Wilson.

## THE DWARF COUPLE.

If we had but discerning eyes, we could read in the accidentals and little occurrences of every-day life, many chapters of instruction. Sometimes the language is so striking, that dull perception is forced to understand it; as in the following instance, where I read a beautiful lesson from the homely page of incident. I give it as noted down in my diary:

"September 4.—This morning, as I was passing through the hall, I noticed a couple entering, whose singular appearance arrested my attention. They were a man and woman of the same height, but both much undersized. Their dress was tidy, but quaint in the extreme, and in the persons of whom was such an entire absence of every line of grace of beauty, that one would suppose such awkward-looking bodies must really feel uncomfortable. I was beginning to regard them as a very grotesque pair, but my mirth was checked upon observing that the woman was entirely sightless.

Alas! thought I, how unequally the gifts of God are distributed. Here is deformity, poverty and blindness! What accumulated misfortunes! Would that I could do something to alleviate so sad a fate. My meditation of condolence was interrupted by an awkward bow from the man to myself, at the same time asking, in a brisk tone, 'Would you like to look at some first rate shoes?—He produced some shoes as extraordinary looking as the venders themselves. I could scarcely repress a smile at his evident pride in the article; but he went on to say, 'They'll outwear four pair of shoemaker's shoes.—These, you see are made by my wife Molly. She's blind, you see, but she cuts these out and sews them every stitch herself.' The woman stood by with that calm, resigned expression, peculiar to the blind. I said to her, 'My friend, is it possible you are able to make these without your eyesight? How long ago did you lose it?' 'I lost both my eyes,' she said, 'before I was two years old.'

I turned to her husband in surprise, and asked:

'Did you not marry blind? Were you not afraid to undertake the care of her?—'The care of Molly!' said the man with a merry laugh, 'why, she has made my fortune. I never had anything I could call my own, till I married her, and now we live snug enough.' Then he went on to expatiate upon his treasure Molly. 'Why, you see how tidy she keeps me. She cuts, and makes, and mends all my clothes. I don't find any shoes easy to my feet but Molly's. Then, if she wants to go anywhere, she's only to take hold of my arm, and I lead her. I'm the sexton at——, and when there are no funerals, I like to bring Molly down town, and we sell a few shoes, just to amuse us and help along. It makes me able to get her all the little notions she wants.' This man, whom I had approached as a disconsolate beggar, was speaking with animation, and a countenance radiant with satisfaction; and the object beside him I thought so forlorn, her sightless face glowed with the

Sweet and merry sunshine of affection's gentle light,
That never wears a sullen cloud, and fadeth not in night.

Here was most poetically illustrated the foundation sentiment of human happiness—reciprocation, interchange of kindness.—Molly found her happiness in clothing her husband, and adding to his means by making shoes. Her husband found his in leading the benighted Molly about, and supplying her wants. Homely as is the guise of this faithful pair, there is more of romance in their history and intercourse than in connexions where gifted youth and beauty are bartered for gold and position. 'But,' said I to Molly, 'do you never feel unhappy in being deprived of sight.'

'Oh, no;—I never grieved about that much since I came to feel that it was all right. I can always busy myself about something. Now, too, we are on the down-hill side of life. My husband, I am sure, is a good man; I seek to be a good woman.—After he has laid a few more in their narrow house, we shall follow, and in my *long home* I shall *see.*' I no longer wondered over the unequally distributed gifts of God's providence, but admired that principle of *compensation* which places happiness within the reach of all, independent of gifts or circumstances. Its springs are in the inner man, and flow outward. The *morale* of this day's lesson I will write thus—'Godliness with contentment is great gain!'"—*Churchman's Magazine.*

This life will not admit of equality; but surely that man who thinks he derives consequence and respect from keeping others at a distance, is as base-minded as the coward who shuns the enemy from the fear of an attack.—*Goethe.*

God is near whenever man asserts his native rights. Remember 'tis His heaven hangs o'er us now!

Experience is the father, and memory the mother of wisdom.

# Miscellaneous.

For Moore's Rural New-Yorker.

## AT EVENING.

BY WM. EDWARD KNOWLES.

The dewy lids of eve have gently closed
Upon the lower world, now hushed and still;
And from the far-off hills the twilight spreads
Her russet livery o'er the silent vale.
Stillness, with wings now folded, nestles there,
Twin sisters, born with silence and with sleep.
And all things animate—from simplest worm,
To man himself—feel the dull heaviness,
And lay them down in sign of sweet repose,
And nature, sleeping in the holy light
Of the full-rounded moon and quiet stars,
Rests not more calmly than the weary heart,
Freed from the fierce embatt'lings of the day.
Its numberless anxieties are checked,
Its earnest longings still, and calmly rest

Within the casket of th' unconscious soul.
An hour like this brings up the bliss of such
Repose. Nor can we murmur that our God
Has here ordained the day and night; has set
Apart our labor, and our rest, and still
And unaware, our thanks arise,
That the grey mantle of the night shuts out
The sleeping from the wakeful world. Know thou,
The coming season, and their speedy change,
Have each an added charm: and the cool breath
Of morn may give a strength before unknown:
And the red sun, ere yet its beams have reached
The wakened vale, may paint its image on
The lofty hills, and add its golden splendor
To morning's charms; yet the taxed senses will
Grow weary, and incline to eve's repose;
The powers of mind and body will desire
The change, and languid g row in sign of rest,—

Father of Life and Light! Thou gav'st to us
The day and night. They are of Thine appointing:
And Thou did'st set them wide apart, in Thine
Unbounded wisdom—Thy light from darkness,
And darkness from the light. We feel Thy goodness
As shades of night close in upon our toil,
Wearied with strife and heat of day. Then comes
The gentle eve, from off her sable throne,
And with a sweet forgetfulness, turns soft
The key of sleep upon a silent world!

Wilson, N. Y., 1853.

For the Rural New-Yorker.

## A REMINISCENCE.

BY S. FURMAN.

No locality but has its tale of historical or legendary interest. Our own beautiful and sequestered region—shut in from the world by the bright waters of the Seneca and Cayuga Lakes—is not without its association and "incidents" of the "olden time."

At an early day in the history of our State, Col. MYNDERSE built a flouring mill at Seneca Falls. This was the first public improvement of any note. Till then, the now beautiful and highly cultivated lands of Seneca county, had developed none of their resources—discovered none of the elements of wealth and agricultural greatness which characterize them at the present day. But American genius and enterprise soon transformed the wilderness into fruitful fields; and where once the god of silence swayed his universal sceptre, the busy hum of industry is heard, and a happy, joyous people have reared their homes. There were no roads then, as now; no stately, hospitable farm house, to greet the eye and gladden the heart of the weary traveler—but the log hut came and reared its rude proportions amid the forest shades—and marked trees served to guide the way between the distant settlement and the pioneer's rude home in the forest. It would not do, in those days, to linger too long upon the caresses of little ones, and the smiles of home; nor "tarry long at the wine," when on embassies of trade at the border settlement. An amusing instance, illustrative of the "poetry" and "heroism" of pioneer life in this country, occurred in the town of Romulus; and as I have never seen it in print, I will endeavor to give it a shape and a dress for the public. It was related to me by the venerable JOHN WARNE, who settled here in 1804.

A Mr. STEPHEN SHERWOOD went to a neighboring settlement on horse-back for supplies, and for some reason did not get started for home till late in the afternoon. It was a mild day in autumn, the balmy south wind whispering enchantingly thro' the thick clustering foliage; now and then snatching — though not rudely — a golden leaf from its parent stem, and bearing it gently to the earth. Mr. SHERWOOD's thot's were soon among the leaves—beautiful, heraldic emblems of the fading glories of the year. The yellow autumn sun, unheeded by our traveler, was fast sinking to rest, and throwing a deeper enchantment over the scene as he shed his lingering, his richest glories upon the world. But now a dark, portentious cloud came swelling up to intercept his golden flood, and wrap the earth in gloom, as if to mimic the soul's eclipse when lighted up by the brightest of earthly hopes. The low muttering of thunder was heard. Its tones deepened, and the night-king was already throwing his dark mantle over the earth. The rain set in. The howling of wolves and the hooting of owls mingled in strange discord with the "music of the spheres," while the fierce lightning lent its terror to the scene. Mr. S. was naturally bold and daring, and never easily frightened, but the conflicting elements seemed now to possess unwonted terror, and to swell a note ill at harmony with his natural calmness within. In the darkness of the hour and the fierceness of the storm, our hero lost his way.

The storm ceased. But Mr. S.'s perplexities increased, as he advanced in an unknown direction. More than once was he compelled to dismount, and with his jack-knife clear away the brush from the fallen tree top, and back his horse out before he could proceed; and now fears, and now anxieties arose to perplex his nervous efforts at every "looking out." But having at length got in an unusually perplexing situation, and finding that all efforts to reach home that night were vain, he cried out in deep dispair, "O God! what shall I do?"

But, hark! The echoing response! Was it the welcome tones of his anxious, waiting wife? The merry shout of his darling boy? Start not, dear reader; it was the wild and savage yell of half a score of wolves, starting up seemingly from under his very feet! And with a deep, unearthly groan, he dropped his reins and his bundle of "notions," and convulsively grasping the trunk of a huge shellbark hickory, was by some mysterious process soon lodged among its branches, some fifty feet from the ground.

High now in his retreat, our hero could distinctly hear the soft murmurings of a little brook, as it leaped over the impediments in its bed, but could neither tell its name or course. And he fancied, too, at times, that he heard his tormenters growling and gnawing at the foot of the tree, intent, if not on climbling after, of at least starving him into a surrender.

But morning came, and with it, a revelation. His "high tower" stood upon the south bank of what is known in the neighborhood, as "Big Hollow," and near the present residence of Mr. H. L. KINNE. His faithful horse still stood where he had so unceremoniously left him, but the "bundle," less fortunately, had lodged in some brambles near the bottom of the steep declivity, where he had surprised the pack of wolves. How he should get down was now a perplexing question. He "got up easy enough," as he afterwards declared, in relating the incident; "but," he would say, with emphasis, "how the deuce I'd get down?" After some difficulty, however, loose bark kicked off, hands bruised, and clothes rent, the feat was accomplished, and Mr. SHERWOOD proceeded homeward, where he arrived towards noon, to the great relief of his family and friends.

For the Rural New-Yorker.

## SOCIAL INTERCOURSE.

THERE is certainly something refining in an intimacy cemented by the pure principles of Friendship. Mind naturally seeks to commingle with its kindred spirit, and doing so it grows better and wiser for the intercourse. It seeks, too, for expansion—for a greater scope of power—for a higher and holier state; and in congenial society, where high moral principles prevail, it finds food for its growth.

Hence we should cultivate the "ties of friendship," and strive to enlarge that communion of spirit whereby one is made better. We should seek ardently for that better and higher state, and though we find we may not make that rapid progess we desire, yet we should take hope to secure all the improvement possible from our privileges. We should strive the more to cultivate and merit the friendship of those whose worth shines pre-eminent in their characters, making them patterns of excellence for others to admire and imitate. Hence should we the more greatly prize the correspondence of those we dearly love as friends, but whose distance from us precludes frequent communion face to face.

Our present rates of postage are cheap and need be no bar to the enjoyment of this priceless boon—the benefits of which may be incalculable. If at first it seem a task, yet a perseverance in it, with care, will in a little while make it pleasure that no price would make us forego. Besides the social benefits, one is more than compensated by the intellectual training he receives. Culling his choicest thoughts, and clothing them in the best language of which he is capable, he comes to find it delightsome, and as practice gives him more experience, he is himself surprised at the progress he is making, and eventually he finds he may say something that can benefit community and thus his means of doing good are vastly increased, whilst the good that comes to himself is equally enhanced in value. The time is surely coming when mind, rather than money, will measure the true worth of the mind in the estimation of the masses; and he whose mind is most adorned with truth and wisdom, and the gems of learning, will be counted greatest among men. Then by all means, cultivate high and social intercourse, and strive for the true advancement of the inward man.

T. E. W.

## FISHING WITH A PIN.

THERE is a quaint idea, not badly set forth in the following extract, entitled "Fishing with a Pin." There are many who fish with pins in this world—some because they are too poor to buy books, and others because they are too lazy to obtain them. That man or woman fishes with a pin who "goes the wrong way to work," or employs incorrect or insufficient means to effect an object. In company with the pin-hook angler, we may class the fisher with a golden hook, or the man who applies great means to effect very small results. The man who plays at games which are not worth the candle, and shoots birds not worth the powder, is a sworn ally of the golden-hook fisherman. But to the extract.

"Oh! what are the prizes we cherish to win,
To the first little shiner we caught with a pin."

Didst thou never, when a little child, tie mother's lost apron string to a willow rod, attach to the string a crooked pin, and then sally forth in pompous dignity to "catch big fish in the river," and sit patiently long hours, watching and wondering why the fish don't come and bite?

When the kind sister came with the inquiry, what luck, "not *one* fish," replies the tearful angler, "they won't bite." No, they won't bite the bad hook, you must have some bait; a grass-hopper will do, if worms are not to be found: then, how in childish innocence you pitied the poor worm, and turned your head aside while it was being fastened upon the pin-hook, and again you cast in the line. What is your reward?—not the perch, or speckled trout you dreamed of, but you return triumphantly with a little shiner poised upon a string.

Did'st thou never think in after years, how like life was thy first essay in angling, "fishing with a pin?" When school days came, and you mingled in the little world of miniature men and women, where many were striving for precedence, yet unwilling to take the necessary steps to gain the desired end, fancying that by some rare fortune they should become wise and great without bait?

Did'st never see a student aiming for distinction, pilfering from Shakespeare, Byron, Milton, and Tom Moore, to embellish his essay, and furnish gassy perorations? Well may you laugh, for he has stolen his bait, and is fishing with a pin!

See that merchant handing down goods, adroitly piling up sugared words the while to win customers, who are better pleased with simple truth, and honesty; he, too, is fishing with a pin.

Mark that politician bowing and smiling, and trying to win favors by pretended friendship from those whom, after election, he would not recognise. Ah! crafty, but short-sighted seeker for office, you are fishing with a pin and unsavory bait.

Look at that aspiring youth, with a large stock of impudence, and a small share of brains, whose greatest strength is like Samson's, in the hair upon his head, upper lip, and chin, whose greatest feat is a liberal display of cash, earned no matter how. See him swell and strut, smoke cigars in people's faces, drink brandy and sherry-cobblers, and utter loud oaths, yet expect to win favors from all who know him. Poor, silly ape! he is fishing for whales with a pin.

Dost see that *nice young man*, fresh from the hands of the tailor and barber, his fashionably curled hair, slick and shining, his hat and cane *a la mode*, resplendent with the glory of new beaver, and patent leather, elaborately coining honeyed words, and soft sentences, to pour into the ears of the fashionable Miss Blank.

Hast marked that young lady, all dress and jewelry, a mantua-maker, and milliner's making advertisement, tripping the streets bowing and smiling, lending a willing ear to the flatteries of her dandy beau, peeping from under her eyelids to see what she has has effected by her manœuvres and flirtations? This charming pair are both anglers in the sea of matrimony. They will be equally successful, for they will each catch a *shiner*, and *nothing more*.

## RAGE FOR THE RURAL.

THERE has been a general airing of country-seats during the last two or three weeks. People who are so fortunate as to possess those agreeable appendages to existence, are hastening to them. Many well known families have already gone—the first of May having released them from hotel and boarding-house engagements. "Country-life within city reach" is growing in public esteem here as well as in Boston and Philadelphia. Indeed, the passion which now exists in the vicinity of New-York for ornamental gardening, cottage architecture and rural embellishment generally, is extraordinary. It amounts to a rage, in some neighborhoods. This accounts for the heterogenous collection of rural objects now daily exposed in Wall street, to tempt place owners to buy and take home with them in the afternoon. Frequently one may see between Trinity Church and the Custom House, Shanghai chickens, Newfoundland dogs, Shetland ponies, birds, trees, pigeons, goats, roots, shrubs, bulbs and seeds, garden chairs, miniature hot-houses, and newly invented implements—all displayed on the sidewalk.—These, with the usual throng of apple-women, cake-dealers, stock brokers and expressmen, render the upper part of Wall street almost impassable. The taste for rural elegance is one of which every one must approve, and by which the whole country should be pervaded.—*Home Journal.*

A COTEMPORARY says he don't believe in the water cure, and gives as a reason—"There is Mr. (naming a noted political editor) he has been *lying in his damp sheet* for twenty years, and he's worse now than ever."

PRIDE hides our own faults, and magnifies the faults of others.

## DOMESTIC LIFE IN GERMANY.

THE following letter originally appeared in the Boston *Congregationalist*. It is from George P. Fisher, Esq., formerly Clerk in the State Department, under J. M. Clayton:

I have become pretty much accustomed to the German style of living, and like it.—But the interest one feels in Germany is mainly a *spiritual* interest, and centers in the scientific, social and domestic circles; in a word, in the *inner* life of the people.—One finds here in the family an intimacy between parents and children, and a devotion of a father to his home circle. The calm German, whose world is in his books, and his spiritual strength of the time, seeks his recreation, and his struggles, in the bosom of his home.

And though he may not have much of the world's goods, he has treasures of knowledge often, and a refinement of culture which the rich cannot buy.

Their fondness for titles is droll. Think of addressing a man as "Herr Gorhein Rath Appellations Ritcher Rosenberben;" and you must put on all the titles, else you are impolite. So it is the universal custom for the wife to receive the titles of her husband, with the female terminations; and I believe the ladies are more sensitive at their omission than the men. For instance, if the husband is professor, the wife is "professor-*inn*." If the husband is "Consistorial Rath," the wife must be addressed as "Consistorial Rath*inn*," else she may be enraged.

The distinction of ranks and occupations is very nicely observed and preserved; and it is for this purpose, I conjecture, that the name of one's occupation is prefixed to his proper name. For example, you hear always of "merchant" such a one, and "cabinet maker" so and so; and a man is reminded to the day of his death, not only of his own, but also of his father's occupation. The proclamation of the banns of marriage in the pulpit is in this style. One hears such notices every day in church, as the following: Mr. Bookseller Herman Frederick Gottlob Eichte, son of Iron dealer (so and so) and Dorothea Maria Schmidt, daughter of Book-keeper (so and so) intond marriage.

When I have talked with intelligent Germans themselves about this title mania, they have laughed at it; but it was the custom, so all of them must conform. Foreigners, however, are allowed some liberties in these things; and where a man has six titles I generally put on three and sometimes four. However, I find it best to conform to the manners of the people. I even attended a great festival in honor of the King's birth-day, and joined in giving the health of the King, Queen, and all the royal family; while a friend by me drank to the "one and thirty stars of the American Union."

Duels are of every day occurence; and more comic than tragic, being fought with swords, and seldom resulting in any material injuries, as the armor of the combatants is an effectual protection for every part of the body except the face, which is sometimes a little slashed. This custom of duelling is defended seriously by almost all the students, and is accompanied with the ceremonies which have come down from remote times. Of course, in the German Universities there is always a teacher of fencing, who prepares the Jesuits and Divines in the "noble art of self-defence."

Let me not forget to say that "Uncle Tom's Cabin" is exciting great attention in Germany. Three translations have already appeared; and the utmost curiosity is felt here to learn something respecting the "niggers." Indeed their interest seemed to be about equally divided between Negroes, Indians and Mormons. On hardly any subject have I been more questioned than concerning the Mormons, a people with whom I have very little acquaintance. If I had a live one to exhibit, I could make a small fortune among these speculative, philosophic, meditative *Deutschen*.

The rapid progress of the Americans, indeed their hurry in every thing, is a marvel to the more quiet nations of the old world. The swiftness of our railroads and steamboats, with all the accidents and explosions, are carefully recorded in the papers. When they tell us that these accidents are horrid, etc., we reply that we prefer to get along faster in the world, even if we do now and then lose a leg or a hand. Here they move slower and surer. Accidents on railroads for example, are almost unheard of. The German takes no step until he has smoked over it.

## DANDIES—BUTTERFLIES.

DANDIES have been styled the "butterflies of society;" but I regard the simile as far too favorable to the dandies. *They* strut in borrowed plumage, and couldn't cut any swell at all, if the tailor, hattor, boot-maker, jeweler, perfumer, etc., did not expend lots of labor in fixing up their mean carcasses—to be often cheated in the end. Now, butterflies soar and glitter in intrinsic radiance, owing their bright beauty wholly to the generous hand of the creator. They don't swindle suits of gay attire out of working insects, and then "feel big" in the results of their fraud. They do the best they know, enjoying healthful and innocent pleasures, leading as useful a life as they are capable of, and insulting or injuring no other creature when they shine in the sunbeams and flit amid the flowers. Here, again, they have the advantage of dandies. For the latter *don't* improve their natural powers, but overload and stifle with finery and folly, all noble aspirations and right endeavors.—They might perform the actions of men, and be honored; they choose to practice the antics of monkeys, and be hissed at.—*New England Farmer.*

SEVERITY o'er reaches its wise purpose; too tightly stretched the bow string snaps.

# For the Ladies.

Written for Moore's Rural New-Yorker.

## TO THE RIVER IN SPRING.

Murmur on thou rippling river
In thy merry course so free,
Hurrying onward, downward, ever
To the blue and boundless sea.
There to leave each tiny wavelet
In its mighty foaming bed,
There to blend thy crystal current
Fresh as at the Fountain Head.

In the deep and ancient forest
Bubbles up a little spring,
In the shade of trembling branches
From the earth's dark breast within:
Thence a little stream meanders,
In the valley low 'tis seen,
Like a winding thread of silver,
On a robe of velvet green.

Now the stream grows broader, deeper,
Changing from the little rill,
To a pleasant placid river
"Wand'ring at its own sweet will;"
Bordered by the willows' fringes,
Almost hidden from the gaze
By the tasseled alder's shadows,
Slow and silently its strays.

When the winter winds are sighing
Through the forest's leafless bough,
Then is hushed the pleasant music,
That its waves are playing now—
Then it wraps an icy mantle
Close around its silent form,
Waiting for the vernal spring-time
With its showers and sunlight warm.

Gentle stream, how oft I've wandered
O'er thy banks in spring's sweet hours,
When on every tufted hillock
Bloom the violet's starry flowers;
And beneath the grateful shadows,
Gazed upon thy glassy stream,
Till the landscape fair around me,
Seemed the pictures of a dream.

Soft and soothing are thy murmurs,
Sweetest music is thy voice,
Morn, and noon, and dewy twilight,
Still thou ever dost rejoice:
Image of the fleeting moments,
Ceaseless as their onward flow,
Bearing all our joys and sorrows
To the tide of Long Ago.

MARY AUGUSTA B.

## GIRLHOOD OF A POETESS.

MY cottage overlooked the mansion and grounds of Mr. Landon, the father of L. E. L. at Old Brompton, a narrow lane only dividing our residences. My first recollection of the future poetess is that of a plump girl, grown enough almost to be mistaken for a woman, bowling a hoop round the walks, with the hoop-stick in one hand and the book in the other, reading as she ran, and as well as she could manage both exercise and instruction at the same time. The exercise was prescribed and insisted upon; the book was her own irrepressible choice. A slight acquaintance grew out of the neighborhood; and I was surprised one day by an intimation from her mother that Letitia was addicted to poetical composition, and asking me to peruse a few of her efforts, and what I thought of them. I read and was exceedingly struck by these juvenile productions—crude and inaccurate, as might be anticipated, in style, but containing ideas so original and extraordinary, that I found it impossible to believe they emanated from the apparent romp, and singular contradiction of the hoop and volume. An elder cousin, who took part in her education, seemed to me to be the real, and Letitia only the ostensible writer, and the application made under that disguise to conceal the diffidence of a first attempt at authorship.—But the bill was a true bill, and my doubts were speedily dispelled.

## RULES FOR HOME EDUCATION.

THE following are worthy of being printed in letters of gold, and being placed in a conspicuous position in every household:

1. From your children's earliest infancy, you must inculcate the necessity of instant obedience.

2. Unite firmness with gentleness. Let your children always understand that you mean exactly what you say.

3. Never promise them anything, unless you are sure that you can give them what you promise.

4. If you tell a child to do something, show him how to do it, and see that it is done.

5. Always punish your children for wilfully disobeying you, but never punish in anger.

6. Never let them perceive that they can vex you or make you lose your self command.

7. If they give way to petulance and temper, wait till they are calm, and then gently reason with them on the impropriety of their conduct.

8. Remember that a little present punishment when the occasion arises, is much more effectual than the threatening of a great punishment should the fault be renewed.

9. Never give your children anything because they cry for it.

10. On no account allow them to do at one time what you have forbidden, under the like circumstances, at another.

11. Teach them that the only sure and easy way to appear good, is to be good.

12. Accustom them to make their little recitals with perfect truth.

13. Never allow of tale-bearing.

14. Teach them that self-indulgence, is the appointed and sure method of securing happiness.

PENSION PROVISOS.—In the Senate of the United States, recently, a pension was granted to Betsey Norton, a widow of ninety odd years, "to continue for life, *unless she marry* again."

MOORE'S RURAL NEW-YORKER.

ROCHESTER, MAY 28, 1853.

PUBLISHER'S NOTICES.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW-YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ ADVERTISEMENTS must be brief, appropriate to the objects of the paper, and accompanied with the cash.

ADDITIONS TO CLUBS—Are still in order. Having but few back numbers, agents and others can order additions to Clubs at $1 per copy from 1st of March or April to end of the year and volume. New Clubs, or single subscribers, can begin 1st March, April, or May, as preferred.

### The Late Storm, and its Effects.

IN our last number, incited thereto by the prevalence of bright sunshine and a balmy, summer air, we indited a few sentences complimentary to the weather. We said—"Since Saturday last, there has been a decided improvement; the sun has been visible some ten or twelve hours a day, and reflected a most genial warmth—which, together with occasional showers, hath hastened vegetation of all kinds, and materially aided the husbandman. This is the first warm and comfortable week of the season, whereat mankind rejoiceth, and Nature is radiant with life and beauty." This was written on Tuesday, P. M. (17th,) after a few days of right pleasant weather. But alas! scarcely was our article in type, ere a decided "change came oe'r the spirit of" the weather—quite upsetting all our ideas of geniality and propriety. The ball was opened with a severe thunder storm on Tuesday night, accompanied by high wind, hail and considerable rain.—The temperature soon hastened the mercury toward Zero,—bringing fires, overcoats, &c., up to par, and in demand. The storm thus inauspiciously commenced, continued at intervals through some five days and nights—during which period the weather remained cool, with high winds, copious showers, and occasional severe thunder storms. At this present writing (Tuesday, 24th,) the weather is apparently moderating, though cool and cloudy, and we have had no rain since Sunday evening. On the whole we have had, if not *enjoyed*, quite a "spell of weather" during the past week.

—The storm has occasioned no little damage. It appears to have been quite severe in many sections of Western and Central New York. We hear of buildings being blown down, and unroofed, in several places,—and of the loss of life and property from lightning. We trust some of the accounts have been exaggerated and that the instances wherein material damage has been sustained will prove few and far between, compared to rumored statements. Little or no injury has been done to the crops, so far as we have ascertained. But the storm has been a great drawback to farmers, who were just making ready, after a very backward spring, to go to work in earnest. We trust the weather will soon be such that our friends can enter upon the compaign more successfully.

### Rural-ward by Railroad.—The Rain.

TUESDAY week found us *en route*, by the Lockport Railroad, for our native town in Niagara Co. It was a pleasant afternoon, and during a brief ride of forty-five miles, we saw many pleasant sights both rural and suburban; for we passed near thriving villages, and through a beautiful farming country. It was our first real Spring trip, and those who love the country can easily understand why Nature had an especial charm for our eyes—it was so new from the beautifying hand of Spring, and so rife with all gladdening vernal influences. The peach and plum trees were laden with blossoms and the apple orchards were just beginning to show their pearl tinted flowers. We are not sure, but think the apple crop will be only an average one, judging from present indications. The tender green of the newly sown oats and barley, and the deeper verdure of meadows, pastures, and wheat fields, never seemed of fairer promise for the future fullness of barn and granary—of purse and larder—than now.

—Yet bright as the prospect is, and fair as show the signs of progress, there is yet "much land to be possessed" by the thorough farmer,—the enterprising, systematic cultivator of the soil.

The R., L. & N. F. Railroad is a right pleasant summer route, aside from what it takes one to,—the mighty Cataract of Niagara. No road is less liable to the objection that there is little of the pleasant country to be seen by those who pass over it, and, as far as we are able to judge, none are better managed for the comfort, safety and accommodation of the public. It has a large way business, and finds, we doubt not, the convenience of this class of fares worthy of attention, being able to give it without detriment to the interests of through passengers.

We were in hopes to speak more fully from observation, of the appearance and prospects of various crops, &c., and to tell of sundry rambles along "the old familiar places" of our childhood. But we were only safely housed beneath the paternal roof, when the rain commenced, and it continued during the greater part of our stay—so our readers are spared the infliction. Corn planting and other Spring work has been delayed by the weather, and the farmers begin to look anxiously for the "clearing off," which has scarcely come yet, since every day has had its shower so far, since our return.—E.

### The Lockport Disaster.—Lighning Rods.

ON the afternoon of Sunday last, the Congregational Church in Lockport was struck by lightning, causing the death of Mr. LUTHER CROCKER, Jr., and injuring more or less SAMUEL DURFEE; CYRUS C. NORTHAM; a lad, son of WILLIAM MACK; MARY PLACE, daughter of GEO. PLACE; FRANCES HOLMES, daughter of ALFRED HOLMES, Esq., and Miss SARAH STEWART. The lightning struck the steeple, passing down into the gallery under it, occupied by the chior, prostrating all the members, and injuring those above named, by burning and otherwise. At the last accounts the injured were likely to recover.

This fearful calamity should admonish all of the necessity of protecting life and property by the erection of suitable lightning rods. Most churches and public buildings are surmounted with something of the sort, but in seven out of ten cases they are useless, from the defective manner in which they are put up. Rods, to be of any avail, should be tipped with some metal which will not corrode, be joined together so as to form an unbroken connection, be insulated by the use of glass, or other non-conductor, where in contact with the building, and descend into the earth far enough to ensure the continual moisture of the lower extremity. Round iron, hooked together like so many pot-hooks, is no security, but rather the opposite, as it has a tendency to attract the subtle fluid which it cannot safely conduct to the earth.

—L. P. BERTHONG, of this city, has some time been, and probably still is, engaged in putting up lightning rods in a manner which has elicited the high commendation of Prof. DEWEY, and other scientific gentlemen, every way competent to judge of their merits. †

CLIFTON SPRINGS.—The public will be glad to learn that the Clifton Springs Establishment has not been damaged by the late storm to the extent first apprehended—and that friend PARKE will soon be ready to receive visitors at his pleasant resort. We have just received the following from "mine host" of the Springs House:

FRIEND MOORE:—In consequence of the exaggerated character Madam Rumor frequently assumes, and may assume in relation to the recent catastrophe at our place, the impression may obtain that we shall not soon be ready for visitors. But I am happy to say that the damage or delay has not been as great as was apprehended by many. The roof is already replaced, and the House will soon be in order for visitors. The baths are in order, the grove and grounds green and inviting, and every thing begins to assume a cheerful and promising aspect. M. P.

## Literary Notices.

TRAVELS IN EGYPT AND PALESTINE. By J. THOMAS, M. D. Philadelphia: Lippencott, Grambo & Co., 1853.

THIS interesting volume of some 200 pages, comprises sketches of travel, which at the same time that they possess all the easy grace of conversation, are vivid pictures of what passed under the author's observation. Amusement and instruction are seldom more agreably combined. The route pursued by the author was somewhat different from that usually taken by eastern tourists, and portions of his descriptions, and more especially the incidents connected with his visit to Gibraltar, Malta, &c., will be new to most American readers. The small size, condensed form, and consequent cheapness of this book of travels, will render it particularly acceptable to those who wish to get a clear knowledge of the present condition of Palestine, (without wading through heavy volumes,) as they follow him through that country. The work will be found a most agreeable companion for an occasional leisure hour. It is for sale by WANZER, BEARDSLEY & Co., of this city, and also, as we are informed, by Alden, Beardsley & Co., Auburn, and by Phinney & Co., and Steele, of Buffalo.

THE NATIONAL MAGAZINE for June, which completes the second volume, is an excellent number, of that valuable and popular periodical. This magazine fills a want not before so well supplied. It is not a magazine of religious literature, as many would suppose from the place of publication, but rather one of such a moral character as to render it unexceptionable to the purest Christian families. New York: Carlton & Phillips.—$2 per annum. DARROW, agent.

BLACKWOOD'S MAGAZINE for May contains an entertaining paper on "Spiritual Manifestations;" another on "Wellington;" another on "Dr. Chalmers;" reviews of Dr. Invans "Voyages et Recits" and "Count Arensberg, or the Days of Luther;" a "Tale from the French Stage," and a continuation of "Lady Lee's Widowhood."—DEWEY, agent.

THE SPRING PLOWING MATCH of the Monroe Co. Ag'l Society, will be held on the farm of DANIEL MCNAUGHTON, half a mile west of the village of Churchville, on Thursday, the 26th inst. The teams start at Meridian.

—Wisconsin has chartered 15,000 miles of Railway, which it will cost $300,000,000 to build.

—The Cobourg Star quotes wheat at 85 cents per bushel, and call it a remunerating price.

—It is stated that every alarm of fire in Boston, costs the city $100.

—One hundred Scotch girls are daily expected at Holyoke, Mass., as operatives in the mills in that place.

—It is stated that Junius Smith's Tea plantation, in South Carolina, is going to ruin, since his death.

—They have strawberries and cherries in New York, brought from Norfolk. The berries sell at 25 and 18 cents per basket.

## Correspondence.

### Letter from Michigan.

CALHOUN CO., Mich., May 15, 1853.

FRIEND MOORE:—As a friend to the Agricultural interest, I improve every available opportunity, by observation and otherwise, to obtain such information as may be interesting, or instructive.—While performing a tour through the Western States, I see much that will undoubtedly be of general interest to the thousands of readers of the RURAL NEW-YORKER, both as regards agricultural prospects, and items of State improvement.

When I reached the interior of this State I expected to find vegetation far ahead of that of Western New York, but I was disappointed. I also supposed farmers would be far in advance with their spring's work, but I find them behind the times. But this backwardness is not usual. The two weeks preceding the 13th inst., were weeks of constant rain, and those who have long been in the State, tell me there has been more successive rainy days, and more rain this spring, than they ever knew before: in consequence of which farmers, and the season, are very backward. For the past few days, lost time is being made up very rapidly in the preparation of large corn fields, which will be planted next week, weather permitting.

Wheat looks remarkably fine all through the interior of the State, and bids fair for a very large harvest. I do not know that I ever saw the entire wheat crop look better, and bid fairer for an abundant yield than now. High hopes with bright anticipations are prevalent with the farmers of Michigan, for wealth, and ease; their labor yielding them a large advance in cash, in return for their products.

Money is becoming plenty and obtainable; also the value of land is rapidly increasing, as an encouragement for the hard, and unsceasing toil, and many inconveniences, these Western pioneers have had to encounter. Within the central part of the State—the agricultural districts lying between the Central and Southern Michigan Railroads—good improved farms are selling for from $10 to $30 per acre, according to the location, quality of soil, improvements, &c.

As regards fruit in this State, I think the prospect was never better, provided the frosts keep their proper distance. Through such portions as I have traversed I could look in no direction scarcely, without beholding a peach orchard in full bloom. Immense quantities of them will be raised; if no evil befall them. Apple, pear, plum and cherry trees, bear upon them one dense mass of blossoms.

Michigan is no longer in the woods, and will soon rank with the first States in the Union, in regard to all the improvements and progressions of this *spiritual* age. The "Maine Liquor Law," which passed the legislature at the last session, is to be voted upon the third Monday of June next. Great efforts are being made to carry it by a large majority. NEAL DOW, of Maine, and other distinguished advocates of Temperance, are lending their assistance in its behalf. Strong hopes are entertained of a great triumph. You will hear from me in Illinois, ere long.

Respectfully, C. W. HOBART.

### Incidents of Travel Westward.---No. 3.

*Area of Ohio—First permanent settlement—Number of miles of Railroad and Canal—Taxable property of the State, Population, Number bushels Corn and Wheat raised in 1850, Number of Sheep, Dairy products, Wine and Maple Sugar—Present appearance of the Wheat Crop, Prospects of Fruit, Prices of produce—Rise in lands—General causes for the rise.*

BRANDYWINE, Ohio, May, 1853.

THE length of Ohio is 216 miles, and mean breadth 200 miles; giving an area of 44,000 square miles, or 26,576,000 acres. It derives its name from that noble River, which washes its Eastern and Southern boundary for 470 miles.

The first permanent settlement was made at Marietta in 1789, by a New England Colony. But little more than half a century has elapsed since that time, and yet it ranks the third in population in the Union; being next to New York and Pennsylvania on the list. Virginia and Tennessee are next to her in point of numbers, but so long as Negro Slavery prevails, Ohio will continue to outstrip them infinitely in population, wealth, and general prosperity. She was received into the confederacy of States in 1802. While there are no mountains in Ohio, yet its surface is a lofty table-land, rising somewhat north of the centre of the State, 1,000 feet above the surface of the ocean. Nineteen-twentieths of the State is susceptiable of a high degree of improvement. It is one of the most productive States in the Union. It has 1,500 miles of Railroad, besides some 500 under contract, and over 700 miles of Canal and slack-water navigation.

The total amount of taxable property in the State in 1850 was, $461,876,340; and her population was 1,981,632. The same year the farmers put 1,537,947 acres into corn, and 1,668,106 acres into wheat. The corn crop averaged 35¾ bushels per acre, the wheat 16½ bushels nearly; the aggregate was over 55 millions bushels of corn, and over 30 millions bushels of wheat. Ohio keeps 3,937,096 sheep, which is more than any other State in the Union,—more than New York by 165,433, (though they shear nearly six oz. less per head.) She has more horses than New York by 70,382, and more swine by 38,390, while the number of cattle in these two great States is about equal. She raises over 37,000,000 bushels of corn, and over 17,000,000 bushels of wheat more than the State of New York. In 1850 the dairy products of the State were 21,350,000 lbs. of cheese, and 34,180,000 lbs. of butter; and she grew over 10,000,000 lbs. of wool. The vine or grape is cultivated in some counties. Over 50,000 gallons of wine are made annually, and over 4,500,0000 lbs. of maple sugar. The value of home wrought manufactures is estimated worth $1,696,000.—When we consider that only 9,730,000 acres, or a little over one third of the State, is improved, we must adopt the conclusion, that the soil is eminently fertile and productive, and that there is an energy and enterprise with the farmers, which entitles them to much and lasting credit.

The wheat crop now on the ground, looks exceedingly well, and promises an abundant harvest. The prospects in the Lake regions for fruit were never more flattering than at the present time. The peach trees are redolent with blossoms, and everywhere present a beautiful appearance. The prices of farm products are as follows:—Wheat, $1 per bushel; corn, 50 cts.; oats, 37½ cts.; potatoes, 37½ cts.; wool, from 42 to 62 cts. per lb; butter, 12½ cts. per lb; eggs, 8 cts. per dozen.

Within twelve months lands have risen from twenty-five to thirty per cent., very generally throughout the State. Farms that one year since could have been purchased for $25 per acre, now readily commands $35 per acre; and it is believed by many that very soon they will bring $50. If you ask for the reason of this belief, perhaps not one in fifty of those who think thus, can assign any reliable grounds for their faith,—yet almost every man argues that property of all kinds is advancing, and will continue to advance, for an indefinite period to come. In 1852 the California and Australia gold mines yielded $200,000,000, or an amount nearly equal to the produce of all the previous gold mines in the world. This fact has caused a large drain from the agricultural and mechanical classes, and while it has taken from the producing class, it has added equally to the consuming class: thus a two-fold cause has acted to enhance the value of farm products.

Yours, &c., S. B. ROCKWELL.

### Incidents of Travel Westward.—No. 4.

*The West settled and built up by the Pilgrim Spirit—Synopsis of the Manufactures of the State—Farmers should fence their wood-lands—Scioto and Miami Vallies fruitful of corn—Instances of enterprising Farmers, &c.*

NORTHFIELD, Ohio, May, 1853.

To the western tourist, the question arises what spirit has animated and moved the enterprising pioneer to engage in felling forests, building towns, making roads, founding cities, erecting churches, establishing and endowing colleges, constructing steam and water mills, building railroads, digging canals, and finally stretching the attenuated wire from village to village, and from city to city, on which the lightning, now acting as a servant-boy, runs of errands and does man's bidding? What spirit has prompted him to forego the pleasures of home, and dare the perils incident to a pioneer life, the diseases peculiar to the climate, and the hardships of clearing up and settling a new country? To all this there can be but one answer.—The west has been settled by the true Pilgrim Spirit. The bold, the enterprising, the strong, go forth to execute deeds like these.

Ohio has invested in the woolen manufactures $870,220, giving employment to 1,200 persons; three-fourths of which number are males, who receive on an average $20 per month. The remainder being females, are paid an average of $10,44 per month. 1,657,726 lbs. of wool are annually converted into cloth, giving upwards of 1,374,000 yards, valued at $1,111,000. In addition to this, she manufactures for sale 65,000 lbs. of yarn. In cotton manufactures she has $297,000 invested, and makes yearly 280,000 yards of sheeting, besides 433,000 lbs. of yarn. The capital invested in manufacturing pig iron is $1,503,000, turning out yearly 52,500 tons. She has invested in the casting or furnace business $2,063,000, making yearly over 37,000 tons, valued at over $2,860,600. Besides this, she manufactures 14,416 tons of wrought iron, valued at $1,076,000. She has eight cotton factories, 130 woolen factories, 183 furnaces, 35 establishments making pig iron, and 11 making wrought iron. These annually consume upwards of 78,000 tons of mineral coal, besides 6,251,000 bushels of coke and charcoal, and the aggregate of capital invested in these various manufactures, is $5,355,000.

The above is a bird's-eye view of the principal manufactures of the State. She is not a manufacturing, but decidedly an agricultural district, yet in part supplies her own wants in cotton and woolen cloths, castings, iron, &c.

At present Ohio is plentifully furnished with wood-lands, and every farmer should know that his interest prompts him to protect and fence these lands against domestic animals, as they will soon rank among the most valuable of his domain. It takes four acres of well timbered land to supply one mile of Railroad one year, consequently the 2,000 miles of Railroad in the State, which will soon be in operation, will demand and consume the wood from 8,000 acres every year.

The Scioto and Miami Vallies are exceedingly productive in corn. Corn fields are frequently four and five miles in length. It is not uncommon for a farmer to raise 5,000 and 6,000 bushels, and instances occur where 10,000 bushels are harvested by a single farmer. I am credibly informed that there is an elevation in the Sciota Valley where an individual can take in at one view, ten thousand acres of corn, waving in the clear sun-light of heaven. Like ancient Egypt, it is literally a land of corn and wine.

We have met with several instances in Ohio strikingly illustrative of the scope and enterprise of western farmers. JAS. W. WALLACE, Esq., of Summit county, has over eleven hundred acres of land under good improvement. Over four hundred acres is bottom land, situated on the Cayohoga river, and is as level as a lake, and as beautiful as the sun ever shone upon. He keeps about 1,000 sheep, and raises from one to two thousand bushels of grain. Another farmer has 1,000 acres of land and keeps 1,500 sheep. Another is largely engaged in the butter and cheese interests, and keeps 1,100 cows. S. B. ROCKWELL.

## News Brebities.

—The ordinary Railroad accident deaths in this country average one a day.

—In the Northern States there is more than one periodical taken to each family.

—The first lot of white wheat from Ohio arrived at Baltimore on Saturday week.

—Seven passenger trains now leave N. York daily on the New York and Erie road.

—Season tickets for the Dublin exhibition have been sold to the number of 5,312.

—More than one hundred Bostonians have left for Europe within the past fortnight.

—Col. Colt is rapidly becoming a millionaire, from the immense sale of his revolvers.

—Prof. Wilson, of Blackwood's Magazine, is past hope of recovery from a paralytic attack.

—The Troy and Boston Road earned in Arpil $13,064, against $4,027 same month last year.

—Mr. T. B. Macaulay is ordered to a warmer climate, for the benefit of his much disordered health.

—A little girl five years old, died in Newark on the 5th inst., from the effects of intoxication by brandy.

—The Lower Canada Agricultural Society, will hold an Exhibition on the four last days of September.

—A hog from Vermont, said to weigh 1150 pounds, and two years and eight months old, is now in Boston.

—Six expeditious have sailed for Liberia since May last, from the United States, embracing 728 emigrants.

—The Congressional Library, in Washington, D. C., is shortly to be opened for the public accommodation.

—The cash value of the real and personal estate in Tennessee, according to the last census, is $201,246,656.

—The receipts of the American Tract Society for the last year were $42,000 in advance of any previous year.

—Eight Senators have received high offices at the hands of the President, and a large number of Representatives.

—Freeman Hunt is preparing for the press, a comprehensive Cyclopedia of American Commerce and Industry.

—The assessed value of property in Baltimore is $104,801,438, showing an increase of $18,697,763 since 1846.

—The Geneseo Republican notices several cases of ship fever among emigrants at the County House in that place.

—Post Office stamps were first introduced in England in 1840, and were shortly afterwards adopted in this country.

—Hon. Caleb Cushing has presented an account of $10,000 against the estate of Daniel Webster, for money lent.

—A lodging has been taken at Paris, for Mrs. Stowe, in the Quartier Montmartre. She is to remain there three months.

—Jesse Hutchinson, of the Hutchinson family, died at a Water Cure establishment near Cincinati, on the 16th inst.

—The declared value of English, steam engine and other mill-work in the month ending February 5th, was £99,982.

—The work on the capitol extension has been recommenced, the Attorney General having decided the contract to be legal.

—Traffic on the New Haven Railroad has not fallen off since the last disaster, as has been stated, but has largely increased.

—Last week a Codfish was caught at Siasconset, which weighed *eighty pounds!* The head, when dressed, weighed twelve pounds.

—There are 229 newspapers printed in Canada, or nearly twice as many as were published in all the world before the American Revolution.

—Counterfeit ten dollar bills on the Shoe & Leather Bank, N. Y. City, have been put in circulation. They are altered from genuine two's.

—The receipts of the Montreal Custom House, which during the month of April last year were £56,719 6s. 8d., are this year £81,312 1s. 7d.

—The attempt to pay off the incumbrances on the estate of Daniel Webster has been abandoned, the demands against it accumulate so rapidly.

—The late storm was very severe in Yates and other eastern counties. The Dundee Record says that along Big Stream the damage has been serious.

—The work on the Canandaigua Road is going on with energy and the road will be completed to the Falls within the time specified in the contract, July.

—Upward of *four hundred persons* have lost their lives during the transit from place to place on our various routes of travel, in the short space of three months.

—The travel on the Ohio river is said to be much larger than ever before. Every steamboat has its full complement of passengers, and all average fair freights.

—The receipts at the Montreal Custom House this season, for the month of April, were $325,248—being $100,000 more than for the same period last year.

—At Holderness, N. H., 100 bushels of pegs are made daily, and most of them shipped to foreign ports. On the first of January 600 barrels were started for Liverpool.

—A gentleman in Cincinnati has given the seamstresses of Cincinnati and Covington $1,000, to assist them in maintaining their demand for their recently established bill of prices.

—The total number of dismissals from office at Washington since March 4th, has been 250. The indications still are, that there will be a complete renovation on or before the first of July.

—The life insurance upon persons who were killed at Norwalk amounts to $30,000, and the Life Insurance Companies have determined to prosecute the Railroad Company to collect their losses.

—We have accounts from Washington that the President and Cabinet are still annoyed, and the public business materially delayed, by the importunities of applicants for the Executive patronage.

—A Washington letter states that the new Post Office envelopes will probably be distributed as early as July. They will be sold at $3,20 per hundred—$3 for the stamps and 20 cents for the envelopes.

—The Constitutional Convention of the State of Delaware, has decided that Judges shall henceforth be chosen by the people. Salaries—Chief Justice, $1,500; Chancellor and Associate Justices, $1,000 each.

# California News.

## Arrival of the United Steteś.

NEW ORLEANS, May 20.—The steamship United States arrived here in five days and two hours from Aspinwall, with San Francisco papers to the 20th April, and a number of passengers brought to Panama by the Golden Gate.

The run from San Francisco to New Orleans has thus occupied but 19 days.

The California news is of very little importance; but as we have only two or three straggling papers, our despatch is necessarily imperfect.

We find no mention of the amount of gold taken out by this arrival, but the accounts from the mines appear to be of a very favorable character.

In the Senate on the 29th of April, the bill for the extension of the city of San Francisco, was indefinitely postponed by the casting vote of the Lieut. Governor. The Legislature was to finally adjourn on the 11th of May.

Two fires had occurred at San Francisco, but were extinguished before any great damage was done.

New discoveries of gold near "Negro Hill," are reported.

The agricultural prospects of the State are in a very flattering condition.

The Alta California says, business continues dull for the leading articles, with still further depression. There is but little change of prices.

Flour was rather firmer; but the stock being generally heavy there is but little chance of improvement in prices. Provisions generally have a declining tendency.

## The Season and Crops at the West.

FROM Michigan, Illinois, and Indiana papers we learn that up to the middle of May, the growing crops looked well, but that long rains had hindered the spring planting. The Joliet (Ill.) "True Democrat" of the 17th, says:

Wheat, oats, rye, &c., in this section look well and promise an abundant harvest. Winter wheat, especially, grows finely, and if not injured by the rust, which sometimes is the case on account of the richness of the soil, the yield will be large.—The recent rains have greatly interfered with arrangements for planting corn. None of any consequence has been planted yet.

The "Prairie State" of the 13th, says:

The recent heavy rains have done great injury to the corn crop. We understand that a great deal of corn planted just before the wet weather set in, will have to be planted over, as it has rotted in the ground. Wheat, oats and grass look remarkably promising.

The Mt. Clemens (Mich.) "Gazette" remarks:

Continued rains prevent the making of many gardens but it is believed that fruit of all descriptions never bid fairer than at present in this county. Wheat and hay will also be heavy.

The Hastings (Mich.) "Pioneer," says that in Barry county the wheat crop never looked better, and from all sections of the State we hear the same remark.

In Indiana the weather has been very wet.

The Fon du Lac (Wis.) "Journal" says that the wheat crop in that region promises an abundant yield. The Appleton "Crescent," Outagamie County, Wis., says the wheat in that vicinity looks unusually promising.

A GIRDLE ROUND THE EARTH.—The Genoa correspondent of the Newark Advertiser writes that among the fruits of the present truce in Europe, may be signalized the projected Line of Telegraph from London to Calcutta and Canton. The great work is already commenced, and the line has been actually made from London to Genoa. The government of Sardinia has also just entered into a contract with Mr. John Brett, who represents a large company of British capitalists—the same which carried the line across the British Channel—for carrying it on from the main land at Spezia to the farther extremity of the Island of Sardinia, in the midst of the Mediterranean; and France will see that it is continued thence to the province of Algiers on the coast of Africa. The interest that England has in its continuance to her rich possessions in the East, is obvious enough without specification.

THE NEW COIN.—The size of the new quarter is the same with the old issues. One side has a full length figure of Liberty, with the shield and liberty cap, with 1853 beneath. On the reverse, the Eagle, as on the old coin, surrounded by rays, with "Quar. Dol." beneath. The director of the Philadelphia mint gives notice that he is ready to purchase silver coin at the rate of $1,21 per oz. gross for Mexican, South American and Spanish dollars, Francs, and all the coins of the United States except three cent pieces, $1,01 for thalers of Sweden and Germany, and bullion of standard fineness at $1,21 per ounce. Parties furnishing silver to the Mint, will receive a preference, in exchange for the new coin, according to the order of priority of their sales to the Mint.

THE CATTLE TRADE.—There appears to be a great scarcity of cattle in the markets at Boston, New York, Philadelphia and Baltimore, which is attributed to the falling off of supplies from Illinois, Ohio and Kentucky. Instead of being taken east, the cattle from the west are driven across the plains to California, attracted thither by an abundance of grass in the way, and better prices for beef in California. The St. Louis Republican of a late date gave the names of seventeen trains about starting, which were to take with them about 9,000 head of cattle. This new market for cattle must enhance prices in the Atlantic markets, and will induce farmers to devote more attention to the raising of stock.

WAR WITH MEXICO.—The *N. Y. Times* thinks the dangers of another war with Mexico imminent, and says:—"Without receiving the indications of a Mexican difficulty at anything more than their lowest value, we are obliged to think them serious and alarming. In the feelings of neither Government is there one conservative element. Both seem to be on the *qui vive* for a conflict. There is a ground of quarrel, and a quarrelsome mood on either; and in such circumstances, we may, at the shortest notice, find the unfinished business of Buena Vista and Cherubusco on our hands, with the sober necessity of finally quenching that *ignus fatuus* of Santa Anna, Mexican nationality."

THE COCHINEAL CROP.—A correspondent of the New York Herald, writing from Guatemala, says that the unusual heavy rains have nearly destroyed the cochineal crop, and that it will not amount to one-fourth its annual product.

# News Paragraphs.

☞ The recent Art Union investigation shows that the profits of the last year of its existence were a little over $80,000, of which amount $478 is now in the Treasury. The property of the institution at the present time consists of four portraits of the four Presidents of the Union, a lease of the building, which expires in 1857, and which now lets for about the same amount it costs, and the above mentioned sum of $478. No drawing has taken place, nor any money been returned to the subscribers.

☞ The American Baptist Publication Society held their twenty-ninth anniversary at Philadelphia a few days since. In the evening session, the annual report was read, showing that they have issued 67 new publications, and 114,700 bound volumes, and 3,000,000 pages of tracts during the past year, and that thirty-four colporteurs were employed; and they have now reached the number of forty-five, who are in actual service; that there have been 25,699 sales.

☞ The Railway Returns of Great Britain and Ireland, for 1852, show that of the passengers, only one in about four hundred thousand was killed, and one in two hundred thousand injured. The returns of the State of New York, for the same period, show that one in every two hundred thousand was killed, and one in every ninety thousand injured.

☞ The revenue receipts from Boston, New York, Baltimore, Philadelphia and New Orleans, for the month of March, were $5,766,000; for April, $4,492,000; total for two months, $2,158,000, making an increase from the year 1852, of of $2,490,000, which is at the rate of 33 per cent. The revenues of the year from all sources will exceed $60,000,000.

☞ The Buffalo Courier learns from the best authority that the railroad will be completed from Canandaigua to Tonawanda by the first day of July. The iron is now being laid from Batavia to the latter place, and the work is in such a state of forwardness as to leave no doubt of its completion by the time specified.

☞ It is stated that an American Captain has discovered an island in the Pacific, not laid down in any chart. It is about five miles long and one and a half miles broad. The island is covered with guano, 8 feet deep. The latitude or longitude of the newly discovered guano bed, was not given by the Captain.

☞ The new Reservoir of the Water Works at Cincinnati has a capacity of seven millions of gallons. The works were commenced in 1817, became the property of the city by purchase in 1839, the control and management were invested in Trustees in 1847, and the Reservoir was rebuilt in 1850.

☞ A new sub-marine telegraph line is being laid down between England and the Continent, across the German Ocean. The place of crossing is wide, when narrower might have been chosen, showing that the sub-marine line is not materially more expensive than the land line.

☞ The wealth of California in stock, is set down in the census at $38,162,000. The grain crop last year was worth $7,532,000; the grass crop $874,000; the vegetables $4,318,000. The total production of the four, nearly $29,000,000. One of the fruit items was 137 bushels of *olives*.

☞ Between the 3d and the 8th of May, inclusive, Bishop De Lancey held confirmation in six parishes, and confirmed in all 67 persons.—Within the same period he consecrated two new churches, one at Niagara Falls, the other at Nunda, Livingston County.

☞ The Iron Railroad Bridge, over the Monongahela, above Fairmount, Va., is nearly completed. This structure, it is said, is the first in size in the United States, and second only to the celebrated iron bridge over the Menai Straits, in Great Britain.

☞ The city of Buffalo is about to take the popular vote on a proposed subscription of $400,000 to the Buffalo and Pittsburg Railroad. The City of Memphis has just voted a subscription of $350,000 to the Memphis and Arkansas Road.

☞ A train passed over the Rochester, Lockport and Niagara Falls Railroad, recently, embracing 15 car loads of cattle, destined for the Eastern market. The cattle, horse and swine trade along the railroad, is augmenting with great rapidity.

☞ Expresses take charge of many curious parcels, but none more unique than one recently conveyed from New Orleans to New York, by Adams & Co., being a *live alligator*, fourteen feet in length, intended for the Crystal Palace.

☞ The American Home Missionary Society has had in its service during the past year 1,087 ministers of the Gospel, in 27 different States and Territories. The receipts exceed those of any previous year by more than $11,000.

☞ An Indian was ordained to the work of the Ministry lately, by the Baptist Home Missionary Society in Troy, who, to attend the Convention, *walked six hundred miles in snow shoes*, accompanied by his wife and child.

☞ The exports of flour from New York from January 1st to May 1st, were 520,925 barrels, against 239,961 barrels same time last year; and of wheat, 840,341 bushels, against 449,123 bushels same time last year.

☞ The entire addition, 30,000 copies, of a paper published in N. York, devoted to the lottery interest, was lately seized by the police, and all concerned with its publicticu have been arrested.

☞ The Scientific American attributes the number of cases of consumption in cities to the dust in the streets, which is constantly inhaled during the dry season into the lungs.

☞ With a view to putting an end to the railway monopolies in New Jersey, it is proposed by an ingenious man that the State of New York and Pennsylvania *buy up* New Jersey!

☞ The Agricultural Society of Ohio county, Va., have leased ten acres of land, on Wheeling Island, for ten years, and are about to fence and fit it as a fair ground.

☞ The whole amount of cash in the U. S. Treasury, May 1st, was $19,009,850, of which over $2,000,000 was at Boston, and over $6,000,000 at New York.

☞ The receipts of the American Seamen's Friend Society, for the year ending the 1st inst., were $25,283, and its expenditures $23,732.

☞ Senator Pearce, of Maryland, it is stated, has accepted the invitation to deliver the address at the Ohio State Fair, at Dayton, in September.

☞ William Waugh, a soldier of the Revolutionary War, died recently at Deering, N. H., at the advanced age of 95 years.

P. S.—The steamship Franklin arrived at New York on the 24th inst., with two days later news—reporting an advance in breadstuffs, and brisk sales. No other news of importance.

# Market Intelligence.

RURAL NEW-YORKER OFFICE,
Rochester, May 25, 1853.

THE market transactions of the past week have presented nothing out of the usual routine of business at this season of the year. Farm produce by teams comes in sparingly, and is in good demand, at prices which should be satisfactory to producers and consumers—for while the staples command fair remunerating rates, they are not so exorbitantly high as to be burdensome to consumers.—Recent foreign advices have affected the cotton market favorably. The grain market in Liverpool is firm with large sales by the last advices.

FLOUR—We have no transactions to note, and prices remain as last quoted.

GRAIN—Wheat is much sought for by millers and all good samples offering are readily taken at $1,17 and upwards. Corn is in demand, commanding 62@63c. Oats still scarce at 44@46c. Barley not active; a sale of barley malt is reported at 78c.

In other marketable commodities we find no change worthy of extended note, and if our market reports are not drawn out to as great an extent as those of some metropolitan journals, it is because we have fewer transactions to note, and do not choose to use an extra amount of puffing and personal opinion in what is written.

THE WATER-CURE JOURNAL.—A New Volume.—Now is the time to subscribe.—Published monthly, in a beautiful quarto. Illustrated with engravings, exhibiting the Structure, Anatomy, and Physiology of the Human Body, with familiar instructions to learners. It is emphatically a Journal of Health, designed to be a complete Family Guide in all diseases.

TERMS—Only One Dollar a Year, in advance. Address, post-paid, FOWLERS AND WELLS, Clinton Hall, No. 131 Nassau Street, New York.

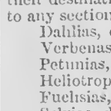
"The Water-Cure Journal holds a high rank in the science of health; always ready, straight-forward and plain-spoken, it unfolds the laws of our physical nature without any pretensions to the technicalities of science, but in a form as attractive and refreshing as the sparkling element of which it treats"—*N. Y. Tribune*. [178w4]

THE ILLUSTRATED AMERICAN PHRENOLOGICAL JOURNAL—Devoted to Phrenology, Physiology, Mechanism, Education, Agriculture, the Natural Sciences, and General Intelligence, profusely illustrated with Engravings. Every family, and especially all young men and women, should have a copy. Published monthly, at One Dollar a year.—All letters should be post-paid, and directed to

FOWLERS AND WELLS,
Clinton Hall, No. 131 Nassau-st., New York

Young men about launching forth upon the activities of life, and anxious to start right, and understand their course, will find this JOURNAL a friend and monitor, to encourage them in virtue, shield them from vice, and to prepare them for usefulness and success in life. The various occupations will be discussed in the light of Phrenology and Physiology, so that every one may know in what pursuit, he would be most likely to succeed.—PUBLISHERS.

### IMPROVED SWINE FOR SALE.



THE Subscriber having been engaged twenty years in rearing and breeding swine, has finally produced a breed equal, if not superior, to any in the United States, for both pedigree and quality. They are bred from the best specimens of Leicestershire, Lincolnshire and Byfield,—the last cross from a pure Suffolk. A description of them would be—a pure white, having not a particle of black scurf on the skin, great length of body, holding their size well from end to end, small heads and legs, the pork of the finest texture, having very thin, tender skin. With regard to fattening, they are always ready to kill from three weeks old; if well fed they attain a weight of from two to three hundreds pounds at nine months old.

The numerous applications for my stock of hogs for several years past, has induced me to breed largely the past year. I have about one hundred pigs at present for sale, and shall continue to breed them at all seasons of the year, having conveniences for so doing. I will ship them to any part of the United States, by railroad or canal, carefully boxed and labeled, with sufficient feed. The prices will be from ten to fifteen dollars each, at from six to ten weeks old. GEORGE SHEFFER.
Scottsville, Monroe Co., N. Y., May, 1853. [178w1]

### GENESEE VALLEY NURSERIES,
*ROCHESTER, N. Y.*

THE season being at hand to set bedding plants, which will continue till the 15th of June next, A. FROST & Co., respectfully announce that they offer this Spring one of the finest collections of Dahlias, Verbenas, Petunias, &c., &c., in the Union, comprising upwards of THREE HUNDRED VARIETIES, many of which they imported directly from the European growers at great expense. All of which they will pack in such a manner that they will reach their destination in perfect safety, and forward the same to any section of the country, at following reduced rates:

| | | | | |
|---|---|---|---|---|
| Dahlias, each, | .25 cents; | per dozen, | | $2,00 |
| Verbenas, do | 18¾ " | " | | 1,50 |
| Petunias, do | 18¾ " | " | | 1,50 |
| Heliotropes, do | .25 " | " | | 2,00 |
| Fuchsias, do | .25 " | | | |
| Salvias, do | .20 " | | | |

Roses, everblooming, 37½ cents.

For other plants and prices, see Catalogue. Where the selection is left to us, parties can depend that none but good plants will be sent out, and only *the most distinct and best sorts*.

☞ All money, properly enclosed, may be sent by mail at the risk of the Proprietors. A. FROST & CO.

MONEY TO LOAN on Bond and Mortgage, on improved farms. L. A. WARD,
[169m6.] 36 State St., Rochester, N. Y.

SEYMOUR & MORGAN'S PATENT
### NEW YORK REAPER, FOR 1853.

THE great value and importance of the *Reaper* to Grain Growers of the world, is established beyond a question of doubt. Frequent tests have been made before Agricultural Societies both in this country and in England, proving the Reaper to save in a single harvest its first cost to the purchaser, over the ordinary way of cutting grain. Probably no implement is as valuable to the farmer where any considerable quantity of grain is raised, as the REAPING MACHINE.

At the present time there are several very good Machines before the Public, and now the question seems to be—which is the best? We claim precedence for ours, considering some of the following principles embodied in our Patents, that are essential to a Reaper and CAN NOT be found in any other Machine; which enables us to offer to the farmers of the United States a

Superior and Perfect Reaping Machine,

which, for durability, exactness of construction, perfect manner of cutting grain, ease with which it may be worked, and lightness of draught has

*NEVER BEEN EQUALLED!*

1st. The cutter bar is placed nearly on a line with the axles of the driving-wheel, and nearly opposite the driving-wheel is the ground-wheel, which being *thirty inches in diameter*, lessens the labor which has heretofore been performed in working such Machines, and does away with all difficulty in backing and turning.

2d. The knife or sickle is scalloped and in sections, which *cannot be clogged;* and in case of accident can be repaired by any good blacksmith.

3d. The man in discharging the grain stands on the *rear* of the platform, where he has his work before him and can perform it in a perfectly natural and easy manner; and also from the construction of the attendant's stand he may change his position according to the length and amount of straw cut.

4th. The new and improved combination box, containing the smaller gear, combines *great strength* and *durability*, with perfect simplicity of arrangement, preventing any displacement or twisting of the gearing; in this it possesses great advantages over any other similar Machine and so far as we know, there have been no failures in the large number made.

5th. The lightness of the Machine and mainly of the side-draught or pressure, which being obviated, enables a *single team* to pass with it over uneven ground with speed and ease.

We make our acknowledgments to the farmers for that generous confidence we have labored so diligently to sustain; and encouraged by the past, we have again commenced the manufacture of a large number for 1853, which we sell under a strong "WARRANTY." The Reaper shall be well made, of good materials, durable with proper care, can cut from 15 to 20 acres per day with one span of horses, and do the work better than done by ordinary cradling, or NO SALE!

Innumerable certificates might be given of the great value of this Machine, but our Reaper is so well known, we deem it unnecessary. By reference to the Reports of our State Agricultural Society, on the trial of Reapers, held at Geneva, N. Y., in July last, it will be seen this Machine cut a given amount in about three-fifths of the average time of other Reapers. The following gentlemen are Agents for the sale of the New York Reaper, and any orders received by them will be filled in due season:

S G Williams, Esq., of Janesville, Wis., is our General Agent for the West, and is authorized to appoint sub-Agents, except in Ohio and Southern Indiana.

Wm Bosworth, is General Agent for the State of Ohio except a few counties. Messrs. Warder & Brokaw, of Springfield, Ohio, have the exclusive right to make and vend for Southern Indiana, north to the 40th deg. of lat. running east to the Ohio Canal, including the south-west corner of the State of Ohio.

E. D. HALLOCK, No. 24 Exchange St., Rochester, has been appointed sole Agent for the sale of the above Reaper, in that city. He will have a Reaper on exhibition at his Agricultural Warehouse, and will at all times be prepared to fill orders at manufacturers prices.

### MERCHANTS SUPPLY STORE.

THE Subscriber has made extensive arrangements which enables him to supply merchants with any of the tools named in the annexed list, at the lowest current rates, either in large or small quantities. The goods are ordered direct from the manufacturers, and are in every respect the best of their kinds made in the United States.

| | |
|---|---|
| 500 dozen | Dunn's Grass Scythes, German, Cast and Silver Steel. |
| 100 do. | Dunn's Grain Scythes, the best in market. |
| 100 do. | Clapp's Patent Scythe Snaths. |
| 50 do. | Lauson's do. do. |
| 50 do. | Clark's Ohio Patent Snaths, Scythes to fit. |
| 50 do. | Wood's Scythe Snaths, cheap. |
| 50 do. | Brand's Manure Forks. |
| 75 do. | Do. Straw Forks. |
| 100 do. | Do. Hay Forks. |

A good supply of Reynolds' Hay and Straw Forks.
100 doz. Whitlock's Solid Cast steel Hoes.
200 " Stillman's Cast steel Hoes.

Scythe Stones, Rifles, and other tools in the same line, all of which will be sold on the lowest terms. Sale rooms at the Agricultural Warehouse of E. D. HALLOCK, 24 Exchange street, Rochester, N. Y. ☞ All orders by mail promptly attended to. HIRAM C. WHITE.

### GARDEN AND FIELD SEEDS
*From the New Establishment of Van Zandt & Bowdish,*
No. 114 State street, Rochester, N. Y.

CAN be purchased of the merchants generally throughout the country, in Papers or Packages, on the most reasonable terms. Also at the Agricultural Warehouse of E. D. HALLOCK, No. 24 Exchange street, near the Clinton Hotel, Rochester, N. Y.

The Seeds from this establishment can be relied on as being of the very best quality. They are mostly imported, or grown by the EASTERN SHAKERS, and are warranted.—Full directions for cultivation printed on each Paper and Package. VAN ZANDT & BOWDISH.
Rochester, N. Y., 1853. 170m6.

### Pure Bred Male Stock at Private Sale,
AT MOUNT FORDHAM, WESTCHESTER CO.,
Eleven Miles from City Hall, New York.

I WILL sell and let from 10 to 12 Short Horned Bulls and Bull Calves, 4 Devon Bulls and Bull Calves, and from 12 to 15 Southdown Rams. The annual sale by Auction will be omitted this year, as I wish to reserve all the Females, having recently purchased another Farm, to enable me to increase my Breeding Establishment. My Hog Stock, including all the Spring litters, are engaged.

Catalogues with full Description and Pedigrees of the above Bulls, and Southdown Rams, with the Prices attached, can be obtained by the 15th April next, from the subscriber, or at any of the principal Agricultural Stores, or from the Editors of the principal Agricultural Journals.
March 23d, 1853. 170m3 L. G. MORRIS.

### GENESEE PAPER MILLS.

CO-PARTNERSHIP NOTICE.—The subscribers having purchased the Genesee Paper Mills property, have this day formed a Co-partnership, under the name and firm of Adams, Huntington & Co., for the purpose of Manufacturing Printing Paper, and dealing at wholesale and retail in all kinds of Paper Stock. Office and Warehouse, No. 93 State street.

FRANCIS T. ADAMS, E. T. HUNTINGTON,
WILLIAM A. ADAMS, ALVAH STRONG,
ALBERT M. HASTINGS, D. D. T. MOORE.
Rochester, April 15, 1853.

### GLEN HAVEN WATER CURE.

THIS Celebrated Institution, by the peculiar method of treatment which Dr. JACKSON practices, and the success attending it, is greatly attracting public attention throughout the Union. The past year it has been visited by invalids from not less than 20 of the States and the Canadas, and hundreds of persons regarded as incurable, have received immense benefits from its waters.

Those wishing information can receive a Circular, free of charge, and those wishing advice for home treatment, can have it by enclosing $1, post-paid, to
JAMES C JACKSON, M. D.,
175-4t Scott, Cortland Co., N. Y.

LOOK AT A NEW PLOW, the cheapest and best Cast Iron Plow in market, doing thorough work and of draft that takes the strain, "as easy as a small sin sits on a rich man's conscience." Call, examine, compare prices, and then you'll buy at HALLOCK'S,
177tf 24 Exchange st., Rochester.

### SALE OF SHORT-HORNS.

I WILL sell by Auction, on Wednesday, 8th June next, at 1 o'clock, P. M., about Thirty of my improved Short Horned Cattle, mostly all the get of my imported Bull.—Up set price from $150 to $300. [169-9t*]
Auburn, N. Y., March, 1853. J. M. SHERWOOD.

## SONG FOR THE DEAD.*

BY KATE WOODLAND.

Awake my harp, thy saddest strain,
And all its mournful notes prolong,
My heart is sad, and yet I fain
Would sing my sweetest, gentlest song.
All lightly should the zephyrs roam,
And silently the waters flow,
And lovingly the sunbeams come,
And birds should carol soft and low:
Hush, robins, hush thy joyous lay,
And softly fold thy shining wing,
Thy song should not be glad to-day,
Or earth be bright with blossoming;
For oh! 'twere mockery to rejoice,
When Death hath hung our hearts in woe,
Hath hushed for age the kindest voice,
And laid our best loved treasure low.

Weep, Mother, weep; thy tears are meet
To glitter o'er thy loved one's head,
Oft hitherward shall stray thy feet,
And linger round the sleeper's bed;
Thou hast led him all life's paths along,
From youth, to manhood's dawning beams,
And thine the holy prayer and song
That lulled him to his baby dreams.
Mourn Brothers, for ye may for him,
And broken words your lips may breathe,
For oh, the brightest flower is dim
That blossomed in your household wreath.
And thou, the pledged and loving one
Who weepest o'er his early tomb,
Ah truly hath thy murmuring sun
Been veiled in midnight's darkest gloom.

Bereaved ones, mourn; but while your eyes
Are glittering with affection's dew,
Uplift them to the beaming skies,
And lo! what radiant scenes they view.
The loved one whom ye gave to earth
There soars on love's untiring wing,
Rejoices in immortal birth,
Amid perennial blossoming.
Parental footsteps lead him on,
O'er sunny fields of balm and bloom,
A Father joys to greet his son,
And loves the grave that brought him home.
Mourners, forget the tomb is drear,
Through which hath passed your love and pride,
For shadowy as the gate is here,
'Tis radiant on the other side.

Carlton, N. Y., May, 1853.

## THE FATHER'S CHOICE.

BY SYLVANUS COBB, JR.

MR. ABEL VEAZIE was the President of a heavy manufacturing company, a situation he had held for many years, and as his interest in the corporation was considerable, he was quite wealthy. By nature he was bluff and off-hand in his manners, and the peculiar duties of his office—coming in constant contact, as he did, with people of all classes and dispositions—had not detracted from his characteristic bluntness. His family consisted of some half dozen sons and one daughter.

The boys had all grown to be men, and were engaged in lucrative business, while Lelia, the youngest child, just opening into young womanhood, was the light and joy of the old man's household.

Among Veazie's favorite clerks, there was a young man named Robert Winslow, who had been in the company's office several years, and who, by his untiring application and exemplary conduct, had insured for himself, not only a permanent situation, but also the respect and confidence of his employer. Young Winslow had a mother and sister whom he supported, and with whom he lived, and consequently he was obliged to economize with great nicety in order to keep matters straight.

The fiscal year of the company was drawing to a close, and for nearly three weeks previous to the opening of our story, Robert Winslow had been in attendance at Mr. Veazie's house every week-day evening, engaged in comparing various accounts, and properly arranging them, in view of a contemplated change in the direction of the corporation. Duplicates had been taken of all the principal papers, and in the revising of them the services of Lelia were frequently called upon, for the old man could never be made to understand why even an heiress might not make herself useful.

Once or twice only, had Veazie actually called upon his child for her services, and on those occasions she would read off the original accounts while the young clerk revised duplicates. Lelia read to Robert, and anon, when for a time the labor was suspended, she hesitated not to talk. There was none of that formal constraint which fashion imposes upon common visits, for their acquaintance had commenced under the easy non-committing auspices of business, and without a thought of aught but that of business, they waded through some pages of the company's journal. Then, when at length they conversed, they thought only of social politeness, and their thoughts and feelings flowed unrestrained.

The third or fourth time that Robert came to the house, Lelia offered her services, and while her father looked over her shoulder, she read from the original drafts the entries, and always when the young man would stop to make a note or marginal reference upon his duplicate, she would peep over the top of the large journal, and watch his handsome features as they worked and varied with his laboring thoughts.

Thus passed away three weeks. Every evening Lelia was sure to come into her father's study, and she was equally sure to stay there till Robert went away. The old man seemed in very deed to be blind to the fact that these meetings were beginning to result in something else beside the mere transaction of business.

"Well, Robert," said Mr. Veazie, one evening as the office was about being closed, "you can now have a short respite from the confinement of the counting-room. The affairs of the concern are all settled, and we shall not start again under two weeks, so you can have that time to yourself, to enjoy and to improve as you see fit."

"I thank you kindly, sir," returned Robert, "though I must say I would rather make myself busy than lay idle so long."

"But you haven't had a resting spell before for four years."

"True, sir, but my mother and sister need all my time, so I can hardly afford to rest, even now."

Veazie never held long arguments, and from his manner on the present occasion, Robert knew there was nothing more to be told, so he put on his hat and started homeward.

The next day, or the day after that, Robert Winslow took a walk over the city, and as he was returning home towards night he was accosted in the street by a gentleman whom he had frequently seen in the counting-house, transacting business with Mr. Veazie.

"Mr. Winslow, I believe," said the gentleman.

"That is my name, sir."

"And mine is Dunham. You may have seen me at your counting-house."

"Yes, sir, I remember."

"Mr. Veazie tells me you would probably like to employ your time to some pecuniary advantage during the business vacation."

"Indeed, I should, sir," returned Robert, while a bright ray of pleasure flashed over his countenance.

"Then I offer you a rare chance. I want you to accompany me to Troy, there to assist me in closing up the books of a heavy firm who have failed and left matters at rather loose ends."

"And when do you want me to go?"

"Oh, this very night. Now in half an hour from this time."

Robert's countenance fell as he heard this, and after a few moment's thought, he said:

"I cannot go so soon. If you could wait two hours, or postpone the matter till to-morrow, I would go."

"That is impossible, Mr. Winslow, for the boat starts in half an hour, and the business admits of no postponement. Veazie tells me that you would be just the man to straighten out these accounts, some of which have been hanging for years, and are now put into the hands of the creditors in that dubious shape. I will pay your expenses, and give you ten dollars a day if you will go with me."

"I cannot go," said Robert, in a somewhat disappointed tone, but yet with decision, "for when I came away this morning, I promised my mother that I would return home before dark. My sister is away, and as my mother is quite weak, she would suffer exceedingly at my absence."

"You will have time to drop her a line by the penny-post, informing her of the cause of your absence," remarked Dunham.

"The penny-postman does not go near my residence after this hour," returned Robert. "No sir," he continued in a decided tone, "I cannot go. I would not leave my mother to suffer in ignorance of my fate this whole night for an hundred times the amount I might earn by the labor. I thank you kindly for your consideration, and I trust you will not blame me for the result."

"Of course I cannot blame you," answered Dunham, "though I am sorry you cannot go. I thought you would need the money."

"So I do need the money, sir," responded the young man, with a slightly flushed face, "but I cannot take it at the sacrifice of what I consider my filial duty."

"Very well—I can find some one at Troy who can do the work. Good evening sir."

Robert responded a "good evening," and then wended his way homeward. The circumstance caused him some uneasiness for a short time, but he soon forgot it, and on the next day, he obtained a first rate job through the aid of Mr. Veazie, at an insurance office in copying policies.

---

Again Robert Winslow was at his desk in Mr. Veazie's counting house. Business had commenced in good earnest and there was a fair prospect of being a long continuance of it. Nearly a week had passed away, when one afternoon a gentleman called in to see Mr. Veazie, and remained in an earnest and close conversation with the old man for full five minutes, and when he turned to go away, Robert thought he heard something like an oath drop from his lips.

"Presuming puppy!" muttered Mr. Veazie, as he sank into a chair near where his young clerk was writing, and pushed back from his desk some dozen important papers. "Why, Robert, the fellow actually had the presumption to ask me for the hand of my little Lelia; and all he's worth in the world is fifteen thousand dollars. Not another bit of real worth does he possess. A pretty match for my daughter truly. Ha, ha!"

Robert Winslow's hand trembled, and his face crimsoned, as the old man spoke, and he turned away to hide the emotion he could not suppress. Veazie took no notice of Robert's manner, but having delivered himself of his blunt opinion, he drew back the documents he had a moment before pushed away from him, and began to examine their contents, while Robert tried to calm his nerves so as to be able to go on with his business.

Towards nightfall Mr. Veazie put away his papers, which he had been inspecting, and having locked them up in his private desk, he began to pull on his gloves.

"Robert," said he, "are your evenings engaged during the present week?"

"Not particularly," returned Robert, as he wiped his pen and placed it behind his ear.

"I want my own private accounts posted up, and if you will do it, I will amply compensate you for your extra labor."

"I ask no compensation, sir. If you will bring your books to-morrow, I will take them home and post them with pleasure."

"No, no—you will have to do it at my own house. I don't wish to let my private books go out of my sight. It will take you but a few evenings to do the whole, and besides you will need some assistance in deciphering the various accounts, for some of the entries I have made, and some have been made by Lelia."

"I could wish that the labor might be done here, sir," said Robert, in a hesitating, nervous manner, while a strange emotion swept over his countenance.

"Done here, sir?" iterated the old gentleman in surprise. "I do not understand you. You found no fault when you labored at my house before. What have you found now in the shape of an objection."

"Do not question me, sir, but pray grant me the favor I ask. Let me do the writing here."

"This is a strange whim, Robert. No sir, if you cannot do the work at my house, I must strain my old eyes to do it myself."

"Mr. Veazie, you misunderstand me, indeed you do," uttered Robert, in a painful and sad tone.

"That can hardly be," returned the old gentleman, with a quiet smile, "since I have no clue to any understanding at all. But really I should be under obligations to you if you would inform me with regard to the cause of this curious affair."

For full two minutes the young man sat with his eyes bent to the floor, but at length he gazed up into the face of his employer, and getting down from his stool, he said while his eyes glistened with gathering moisture, and his lips trembled.

"Mr. Veazie, you have been kind and considerate towards me and I will not now break the strict frankness and integrity which have thus far marked all my dealings with you. I trust you will not blame me, sir, nor think me presumptuous. I did work for you at your own dwelling, and you called your daughter to assist me. Together Lelia and myself examined and compared notes and then conversed. Ere long, I began to be anxious for the evening to come, that I might be again at her side, and when she came with her joyous smile, her happy look, and her sweet welcome, I began to count the flying moments as sands of gold. I almost prayed that my work might have no end, so that she might be ever my companion in its slow progress, and when the labor did draw to a close, I felt sad and lonely. Then was it that my heart awoke to a knowledge of its situation. I began to love the gentle being who had thus been my unsought companion—I had loved her, and her image was on my heart. I cannot deceive myself, sir, nor will I prove unkind or ungenerous to you. No man can govern the strong emotions of the heart, though he may, if he be wise, guard against the cause of these emotions. Mr. Veazie, I dare not subject myself to a love that must be hopeless, for poor as I am, my heart is as those of others. Now you know all."

"You are honest, at all events," said the old gentleman, without any apparent emotion.

"So I trust I may always be," returned Robert.

"But do you think you are very wise!"

"I could not help my emotions, sir."

"And if they were as pleasant as you have described them to me, I see not why you should have wished such a thing as trying to prevent them."

Robert looked up into the face of the old gentleman, but made no answer. He could not comprehend his meaning.

"It is Lelia," continued the old gentleman, "who wished you to come and help her arrange my household accounts. Would you refuse her as you have me?"

Robert Winslow trembled from head to foot. He gazed into the face of his employer, and thought he could detect a kind, meaning smile there. He attempted to speak, but his words came not forth.

"Come, come," uttered Veazie, "let us not beat around the bush any longer. I am not blind, and consequently I failed not to see some things that spoke louder than words. I took note of the gentle love-god that danced in your eyes, and I read the language that came up from your heart, and stood in living characters upon your varying countenance. Do you suppose I should have been so utterly regardless of both your own and my child's welfare, as to have allowed you to cherish the flowers of affections only that I might blight them at their birth? Lelia is a faithful, a gentle, and loving girl, and if you love her truly, you may confess to her your enormous sin of love."

"Mr. Veazie," exclaimed Robert, "I cannot comprehend—I do not. No, no, you would not raise such a sweet, such a heavenly hope in my bosom, to crush it again."

"Hark ye, Robert," said the old gentleman, as he took his clerk by the hand.—"Had I desired to have my child married to a heartless bag of gold, I had the chance this afternoon. That man who came here to ask me for the hand of my daughter, though he has fifteen thousand dollars worth of gold, is yet steeped to the very dregs in poverty. He has no heart! I have watched your course for the last five years with interest, and a week ago, when you refused a considerable amount of money which you very much needed, rather than your mother should suffer a single night's uneasiness on your account, you proved yourself to be possessed of a mine of wealth which no legacy could have brought you; and which could never have been poured into life-coffers by speculation. Mr. Dunham brought me your answer, and when I heard it, I resolved within myself that the son and brother who could love and honor his mother and sister, could not fail of making a most excellent husband. Now go and tell all to Lelia, and if she accepts your hand, you shall most freely have her's in return.—There, don't cry about it, you ain't sure she will have you, yet."

Robert Winslow did offer Lelia Veazie his hand and heart, and she smiled a most happy smile as she gave him hers in return.—People wondered much at the affair, and many attributed it to a freak of the old man's oddity. They knew not—and many could not have appreciated, if they had known—the deepest principle of paternal care and kindness which governed him; nor was Mr. Veazie disappointed in his calculations.—The same heart that had cherished such pure and holy filial love proved a sacred altar for the affections of the husband, and Lelia never had occasion to regret—but always blessed—her Father's Choice.

# Wit and Humor.

### ORIGINAL COMMENTATOR.

THE best specimen of original criticism we ever heard, was in a stage-coach ride to ———. Three of us were talking about Adam and his fall. The point of discussion was the apparent impossibility, that a perfect man like Adam could commit sin.

"But he wasn't perfect," said one of the three.

"Wasn't perfect!" we ejaculated in amazement.

"No, sir, he wasn't perfect," repeated our commentator.

"What do you mean?" we asked.

"Well," answered the authority, "he was made perfect, I admit, but he didn't stay perfect."

"How?"

"Why, did not his Maker take out one of his ribs? If he was perfect with all his ribs, he was not perfect after losing one of his ribs, was he, say?"

Our say was silent.

---

A STRANGE ADVENTURE.—Mr. Rodblossem drank more than his usual allowance of rum and sugar, one cold night last week; the consequence of which was he gave his wife a rather confused account of his conduct, on his return home.

"Mr. Smith's grocery store invited me to go and drink cousin Sam—and you see, the weather was dry—and I was very sloppy—so I didn't mind punching one drink—and 'squeer how my head went into the punch, though! The way home was so dizzy that I slipped upon a little dog—the corner of the street bit me—and an old gentleman with cropped ears, and brass collar on his neck said he belonged to the dog—and I was—you undestand—'ic—that is, I don't know nothing more about it!"

---

VERY GREEN, INDEED.—Mr. Green, the reformed gamester, has been giving a lecture before some members of our Logislature, in which he *explained his tricks*. Surely, this is teaching your grandmother. We venture to say, that two out of three politicians could teach Mr. Green a few tricks he never dream't of.—*Lantern.*

---

HOPELESS.—One of the prisoners convicted last session, while being conveyed to Sing Sing, declared that his brother was an Alderman, *and he wasn't ashamed to own it.* The man not ashamed to be related to an Alderman is too far gone for reformation.—He should be locked up for life!—*Lantern.*

---

ONE of the best universal panaceas is a half eagle. For diseases which attack the poor, there is nothing that can begin with it. People who prescribe for the widow and the fatherless will please enter it in their note book.

---

DOWN SOUTH, a newly appointed jailor once told the convicts that if they did not behave themselves, he would *kick them out of the establishment!*

---

"MR. SWIPES, I've just kicked your William out of doors." "Well, Mr. Swingle, it's the first *bill* you've footed this many a day."

### MISCELLANEOUS ENIGMA.

I am composed of 19 letters.
My 1, 3, 11 is an article of import.
My 2, 5, 6, 3 is beautiful.
My 3, 11, 12, 4 is one of the points of the compass.
My 6, 5, 17, 13 is a small insect.
My 7, 18, 12, 17, 8, 19 is a city in the United States.
My 13, 14, 19, 16, 3 is used in-doors.
My 12, 2, 11, 15, 16, 11, 14, 3 are a species of fowls.
My 10, 14, 19, 16, 12 all birds have.
My 9, 11, 12, 2, 14, 8, 15 many follow.
My 19, 3, 14, 16, 13 horses often do.

My whole is annually visited by many citizens of the United States. P. W. D.

☞Answer next week.

### ANSWER TO ENIGMA, &c., IN NO. 21.

Answer to Geographical Enigma—*General George Washington.*

Answer to Miscellaneous Enigma—*Major General Nathaniel Green.*

Answer to Arithmetical Question—7 shillings and 6 pence.

BREEDERS of IMPROVED STOCK, and all who have Domestic Animals for sale, will find the WOOL GROWER and STOCK REGISTER the best medium of communication with those most interested in Sheep, Cattle, Horses, Swine, Poultry, &c. It is published monthly—is the only American journal devoted primarily to Wool and Stock Growing, and kindred matters—and has a general and increasing circulation throughout the Union. On the 1st of July ensuing, a cover of 8 pages will be added to the work, when the publisher will be enabled to accommodate advertisers, whose favors have heretofore been declined for want of space. Those who wish to avail themselves of the advantages of its pages are informed that the terms of advertising are $1 per square (ten lines, or 100 words) for each insertion. Advertisements for the July number should be forwarded on or before the 15th of June.

Address, D. D. T. MOORE,
Rochester, N. Y.

**PEAS! PEAS! PEAS!**

WE most respectfully call the attention of Farmers and others to our extensive assortment of Field and Garden Peas; among the former are

200 bushels Common Marrowfats.
400 do. Junes.

400 do. Common Canada.

And among the latter are

25 bushels Superior Early Kents, earliest grown.
5 do. Prince Albert.
100 do. Early Warwick—superior.
200 do. do. Washington.
100 do. Marrowfats, superior article.
50 do. Black Eye Marrowfats.
25 do. Dwarf Blue Imperial.
10 do. Monastery Marrow.
25 do. Blue Marrowfats.

Also, various other choice kinds,—all of which will be sold at small profits for cash, at the Genesee Seed Store 63 & 65 Buffalo st., Rochester.

172-tf J. RAPALJE & CO.

**Imported Horse, "Consternation,"**

WILL stand this season at the farm of the subscriber, two miles west of Syracuse and adjoining the village of Geddes. His colts and fillies are already in demand for breeding. Several have been sold during the past winter, at handsome prices, to go out of the State.

Terms.—$10 for the season, and $15 to insure; the money to be paid in advance in all cases. When a mare is insured and left at the farm of the subscriber, or regularly returned to the horse until the groom is satisfied she is in foal, a receipt will be given promising to refund the money if the mare was not got in foal. Pasturage furnished at three shillings per week. Mares to be at the risk of owners in all respects. J. B. BURNETT,

May 14. [177-tf] Syracuse, N. Y.

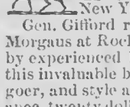
**NORMAN HORSE LOUIS PHILIPPE!**

THIS Celebrated Horse, owned by ROBERT B. HOWLAND, of Union Springs, Cayuga Co., N. Y., and bred by EDWARD HARRIS, of Morristown, New Jersey, from his pure imported Norman Stock, will be kept the present season at the following places, to wit:—On Mondays, Tuesdays and Wednesdays of each week, at the stable of R. B. ROBINSON, in Farmington, Ontario county; on Thursday, at Victor village; on Friday, at Fairport, Monroe county, and on Saturday, at Egypt.

TERMS:—$8,00 for the season, and $10,00 to insure.—Mares to be returned to the Horse once a week, or until the groom is satisfied they are with foal, and to be, in all respects, at the risk of the owners. Pasturage furnished at four shillings per week. JOS. R ROBINSON.

176w6*

**MORGAN HORSE "GEN. GIFFORD."**



THIS justly celebrated horse will be kept the present season at Lodi Village, Seneca Co., New York.

Gen. Gifford received the 1st Premium in the class of Morgans at Rochester, in September, 1851, and is regarded by experienced horsemen as the best living specimen of this invaluable breed;—is a perfect model in form, a sharp goer, and style and action unsurpassed. Terms of insurance, twenty dollars. CHARLES W. INGERSOLL.

Lodi, April, 1853. 161w8

**SPRING GRAIN AND SEEDS.**

WE have now on hand and for sale at the Genesee Seed Store, the following Field Grains:

100 bushels Pure Fife Spring Wheat.
100 do. Barley, 4 or 6 round.
25 do. Do. superior new variety, 2 round.
100 do. Buckwheat.
100 do. Racine or Cat-tail Oats.
200 do. Reapt Timothy seed.
400 do. Common do.
25 do. Large Clover.
25 do. Red Top.
20 do. Orchard Grass.
50 do. Millet.

172-tf. J. RAPALJE & CO.

**SEED POTATOES.**

WE have on hand 200 bushels of the celebrated White Mercer Potatoes, at $2 per barrel, delivered at the Railroad or Canal, in this city.

100 bushels Early Junes.
50 do Mountain Junes.
25 do Wild Mexicans.
25 do Carters.
50 do Irish Cups. J. RAPALJE & CO.

172-tf. 63 & 65 Buffalo st., Rochester.

**GREAT PRIZE MEDAL.**

THE WORLD'S FAIR AT LONDON, awarded us a MAMMOTH SILVER MEDAL for the BEST HATS.—Gents wishing the Spring and Summer style, will call. We are prepared to serve you with a superior article, and of the most becoming style.

CLARK & GILMAN, 23 State St.,

[169-3m.] Rochester N. Y.

FODDER MAY BE SHORT!—So plant an acre or so of Carrots, Ruta bagas, Beets, and Swede's Turnips. Don't get the back-ache doing it, but use the NEW HAND SEED DRILL, got up and sold (with the seeds for planting) at HALLOCK'S,

177tf 24 Exchange st., Rochester.

**MOORE'S RURAL NEW-YORKER:**

A WEEKLY HOME JOURNAL,

For both Country and Town Residents.

PUBLICATION OFFICE,

BURNS' BLOCK, CORNER STATE AND BUFFALO STS., ROCHESTER, N. Y.

**TERMS, IN ADVANCE:**

TWO DOLLARS A YEAR—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

Terms of Advertising

ONE DOLLAR per square (ten lines—100 words, or less,) for each insertion,—*in advance.* ☞ The circulation of the NEW-YORKER is much larger than that of any other newspaper published in the State, out of New York city. Only a limited space, however, is devoted to advertisements, and hence preference is given to those most appropriate—such as the cards and notices of dealers in Agricultural Implements and Machinery,—Horticulturists and Seedsmen,—Booksellers and Publishers,—Inventors, etc. All orders by mail should be accompanied with the cash.

To enable us to accommodate as many as possible, brief advertisements are preferred. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

**THE WOOL GROWER AND STOCK REGISTER.**

THIS is the only American Journal primarily devoted to the interest of Wool and Stock Growers, and should be in the hands of *every owner of Domestic Animals.* It is ably conducted, published in the best style, and finely illustrated. Each number contains a careful Review of the WOOL and CATTLE MARKETS, and much other *useful* and *reliable* information which can be obtained from no other source. The Fourth Volume commenced in July last.

Terms:—FIFTY CENTS A YEAR; Five Copies for $2; Eight for $3; Eleven for $4. Back volumes, bound in paper, at 40 cts. each,—unbound at 35 cts., or three for $1.

Published monthly, in octavo form. Specimen numbers sent free. Money, properly enclosed, at our risk.

Address D. D. T. MOORE, Rochester, N. Y.

# MOORE'S RURAL NEW-YORKER.

VOLUME IV. NO. 23. ROCHESTER, N. Y.—SATURDAY, JUNE 4, 1853. WHOLE NO. 179.

MOORE'S RURAL NEW-YORKER:
A QUARTO WEEKLY
Agricultural, Literary and Family Newspaper

CONDUCTED BY D. D. T. MOORE,
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter—interspersed with many appropriate and handsome engravings—than any other paper published in this Country.

☞ FOR TERMS, &c., see last page.

## Rural New-Yorker.

### Progress and Improvement.

### THE RUTA BAGA.

IN its natural relations, the Turnip is a member of the *Cruciferous* family. As a class, this family is of much importance to man, numbering as it does sixteen hundred known species, divided into one hundred and seventy-three genera, none of which are really poisonous. The most of them abound in the temperate zone. Among the prominent characteristics of the order, one is, that the four flower petals are arrayed in two opposite pairs, like an ×, and almost universally yellow or white—rarely purple. The seeds are contained in narrow or flattened pods. The order possesses many plants of a nutritious quality, that add much to the sustenance and comfort of the human species. Prominent among them are the turnip and cabbage, while the mustard, radish, &c., yield us desirable condiments. They possess a peculiar volatile principle. Sulpher is a constituent of their organization—in some of them to quite an extent. Nitrogen is also abundant in their structure. Medically they are anti-scorbutic and highly stimulating, being consequently highly desirable articles of food.

The turnip is found in the genera, *Brassica*, with the cabbage, and like the latter, has changed its character very much under the foster care of good husbandry. It is a root that is now, in its proper latitude, generally cultivated, being successfully raised as far south as the twenty-sixth parallel. It has added wonderfully to the British farmer's means, and has likewise ameliorated his land. Drawing much of its nourishment from the air, it does not suck out the fat of the soil, and leave it in an impoverished state.

The ancients, we are told, esteemed it highly, and carried its cultivation to a great degree of perfection, and the cooking of it to quite as high a state of excellence. An anecdote is related of a King of Bythnia, who, in the midst of winter, was on a hunting excursion, far from the sea. Being seized with an unaccountable longing for a certain fish, his cook, a master in the art, to honor the whim of his master, had recourse to stratagem. Selecting a very fine turnip, he shaped it into the exact form of the fish, fried it in a certain oil, and served it up properly seasoned with salt and the powdered grains of black poppies. So perfect was the resemblance that the exquisite taste of his majesty was deceived, and he praised it heartily as one of the most delicious specimens of his favorite fish.

The small size of the turnip seed is well known, and yet from this insignificant embryo, aided by the proper elements of growth, a product is secured that for its comparative magnitude is truly astonishing. As a proof of the wonderful power of vegetation, it is related that Dr. DESAGULIERS made a careful calculation, the result of which was, that an ounce of turnip seed contained from fourteen to fifteen thousand grains. Hence, at the most, the weight of a single seed is the one-fourteenth thousandth part of an ounce. Supposing the increase of its growth to be uniform and under favorable circumstances, it must increase its weight fifteen times in a minute. From an actual experiment, said to have been made in England on peaty soil, turnips were found to increase by growth fifteen thousand nine-hundred and ninety times the weight of their seeds, each day they stood upon it.

The judicious farmer does not confine himself wholly to one or two crops, but cultivates a variety, giving the preference to those that most remunerate him, while they make the lightest drafts on the soil.—As one among these, the turnip claims a prominent place, and to those who do not yet cultivate it, it is well worthy of consideration. The large amount of watery matter,—according to most authors, nearly ninety per cent,—renders it valuable to mix with dry and concentrated food. By such a course, the bowels of the animal are more properly distended, and kept in a healthy condition. Under good management twenty and twenty-five tons to the acre is not an uncommon yield. After deducting the watery substance of the turnip, the remaining one-tenth, being solid nutritious matter, gives a greater yield of real substantial food than any of the grain crops. Compared with wheat, the difference is double and more. Oats range nearly in the same ratio, while with corn the difference is one-third.

Ruta Baga is an exceedingly cheap crop to raise,—the cost per bushel of the various crops that have from time to time been awarded the premiums of our State Society, have ranged from two and one-half to four cents a bushel. To ensure them at this cheap rate the soil must be well adapted, made very mellow, and withal rich, and then kept free from weeds, and often stirred. So, indeed, it is with any crop—your half-tilled land, and half-cultivated crops, always cost what they are worth, if they do not even take money from the pocket.

The soil best adapted to the Ruta Baga seems to be a sandy loam. If this is new and fresh, so much the better. A stout growth of clover, well turned under and the surface finely pulverized, will give a most generous yield. If the crop succeeds some other, especially if the former has had no manure, the soil must be made rich artificially.

From the 10th to the 13th of June is the proper time for putting in the seed, which should be sown in drills, some thirty inches asunder. The plants should be thinned to eight or ten inches apart in the drills. In the matter of cultivation time should be taken by the forelock, and so soon as they can be well distinguished in the drills, give them a weeding,—thus will they get the start, and the weeds be easily kept under; and afterwards the cultivator, passing frequently between the rows, will keep the soil mellow and all right.

Turnips may be left growing as long as the weather can be prudently trusted, as they grow quite rapidly in the cool autumnal temperature. Indeed, they will grow till the ground is frozen. Nor will a slight freezing injure them, if the frost be extracted by the earth again. At all events they should be secured in the cellar and pits before December. They should be kept in a cool temperature, lower than one would have for potatoes. In the pit the covering may be quite light, with a passage left at the summit for the escape of the gaseous exhalations.

—Yes, farmers, give more attention to root crops, for you will certainly find it to your advantage. Don't think the little plants "are such a trouble to tend," but take clean land and give good care, and you will find the little things will yield you monsters, that will make glad your stock, and add largely to you dividends.

### FOREIGN vs. HOME SALT.

IN an interesting article upon making and preserving butter, contributed to the *Freeman's Journal*, by LORENZO CARRYL, we find the oft-repeated and stereotype recommendation that butter should be "salted with the best Ashton's Liverpool Salt." We have no doubt the writer thought he was giving the best possible directions without as much as inquiring whether there was not made in our own State, large quantities of salt in every respect equal to the brand which he recommends the Otsego dairyman to use.

We are aware it is often urged that Onondaga salt is not pure, that it contains lime and many other foreign substances, which detract from its good qualities, and render it unsafe for dairy purposes. Do they ever stop to inquire whether the Liverpool or other imported salt contains any of these impurities? We think not. The dealers in New York pretend to give a preference for butter put down with foreign, and hence the Onondaga is generally decided as unsafe or unfit for that purpose.

If dairymen would but take the trouble to ascertain the fact, they would find that every analysis proved the Onondaga Salt more free from obnoxious substances than the Liverpool or Turks Island; that it is not only purer, but stronger, and can be used with quite as much certainty; and that it will preserve butter and cheese, as well as any salt that can be obtained. In every trial, where each has received an equal test, the good qualities of the Onondaga Salt have been triumphantly vindicated. It is time the humbug of sending to Europe, for salt to preserve American butter, while we have a superior article at home, was exploded.

### DIRECTIONS OF PARALLEL DRAINS.

EDITORS RURAL:—I consider Mr. REDPATH'S Essay on Draining an able production. Its main features are excellent, and it will be of great value to that class of your readers who are beginning or extending improvements by draining. Yet it would be suprising to find the author perfect on every point where the case calls for so much variation in its application, and the materials to be used are of so many different kinds.

To my mind, the most objectionable item in the Essay is the direction for filling the ditch partly full with small stones above the conduit or water course. But in a few weeks Mr. CONE'S article placed that item correct, only had he closed by saying, at least 2½ instead of two feet of earth above the conduit, it would have suited me better. As Mr. CONE finds it profitable to pulverize the soil and subsoil to the depth of 20 inches, according to his statement he would have but four inches of undisturbed soil above the conduit. But the soil is liable to be moved off in some places, by long and constant cultivation; so Mr. C. might find after a term of years, his drains too shallow for his deep tillage.

Again, we get another article making some exceptions to the Essay, over the signature of Uncle ABRAM DAN. Uncle A. is surprised that Mr. REDPATH is so much behind the times, as to lay his parallel drains directly up the hill. He says, that was the practice in England, many years ago, but at present, together with his own experience in draining, that it is found best to put parallel drains sideways of the hill, with but a little fall. Now, I have had some experience on this very subject for the past twelve years, and with such soil and subsoil as mine, I have become convinced that Mr. R.'s practice is much the best. About 12 years since, I put a main drain, through a swale—the land rising from it on each side, on an average about 1½ feet to the rod, for near 20 rods. About half way up the banks there were layers of sand, and springs of water making out the greater part of the way across the field. This being my first effort in laying parallel drains, I adopted Uncle ABRAM'S plan of laying them sideways of the hill, between the wet and the dry, to cut off the springs. But invariably the land has been kept wet and cold below, by the water filtering from the bottom of the drains. I have now put parallel drains directly up the hill, 32 feet apart, and the land is more effectually drained than it could be by the same amount of parallel drains sideways of the hill, and their liability to be filled up by the lodgment of quicksand and dirt is much less.

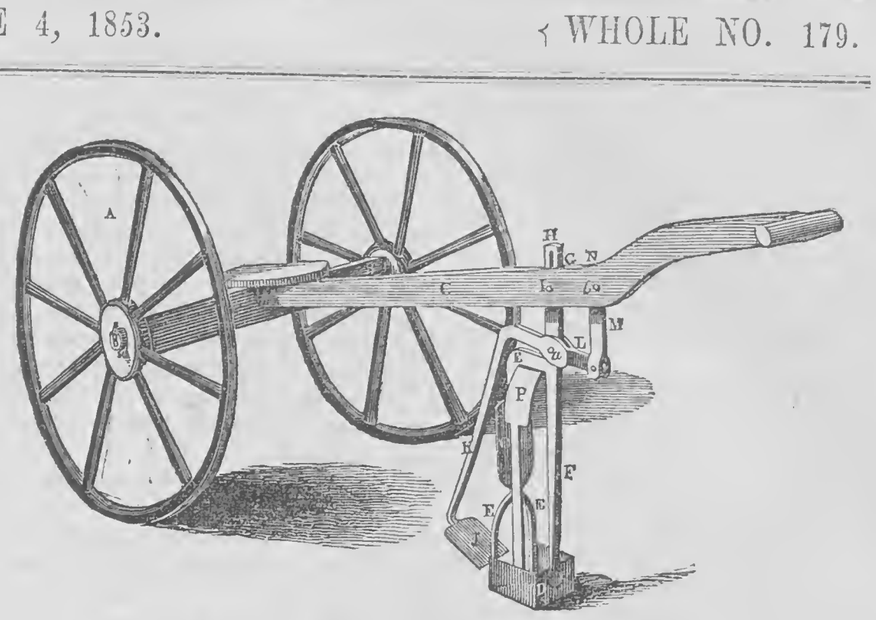
There has never been a time in the United States, when farmers so much needed correct information on the subject of draining as the present. And they are generally investigating the subject, and every drain, that is built is making new advocates for the improvement. I am glad to see so much interest manifested, and hope if any of the readers of the RURAL can show a better way than has been given, they will please pass it along to the Editors. I have many inquiries to answer, and feel the necessity of being correctly informed on the subject.

Uncle ABRAM hints that he understands how to make tools to open drains. I have thought for some time, that we needed a different spade than I had ever seen, to take the last cut out of the ditch after it is settled two feet, with a common spade. According to my views the handle of the spade should be similar to a common spade, only longer with much more crook to it. The blade should be 18 inches long and 5 inches wide, and sufficiently stout to break stiff clay subsoil. The handle being long and crooked, the loose dirt could be taken out and the bottom leveled without getting into the bottom of a ditch so narrow as it might be dug for tile and pipe draining.

ALVIN WILCOX.

West Bloomfield, N. Y., May, 1853.

AN increase of farm products lessens the market price, and the consumer is more benefited than the producer. Therefore the encouragement of agriculture is the interest of the whole people. It is the first duty of the States to encourage agricultural improvement.



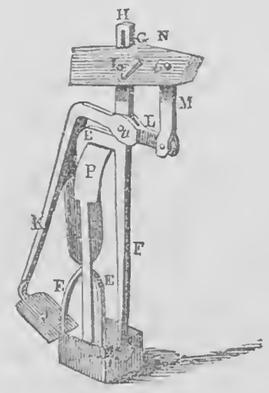
MORRILL'S IMPROVED DITCHING MACHINE.

THIS engraving is a perspective view of a ditching machine, patented by JONATHAN W. MORRILL, of Hampton Falls, N. H., May 10th, 1853.

A A are the wheels; B is the axle of the same, across which the beam lever, C, is secured. The cutters for ditching are placed and secured in this lever. D D D are the cutters for cutting the sides and front edge of the sods. These cutters are united together and are braced and supported by the stirrup brace, E, which has a vertical bar, F, secured to the front edge, and passes up through the slot, G, in the lever, C. This bar, F, has a slot, H, cut in its upper end with a pin, I, passing through it to make it fast to the lever. As the cutters are raised and lowered, the slot in the bar, F, admits of the lever, C, being depressed and raised. J is a spade, cutter, or scooper; it has a bent handle, K, L, which turns on a fulcrum pin, *a*, which passes through the bar, F. The part, L, is secured to a link, M, which passes up through a mortice, N, in the beam, and it is loosely secured in the same by a pin, *c*, which it allows to move back and forth, as the cutters, D D D, and spade, J, are depressed or elevated. O P are thin plates of metal for guiding the sod as it is raised up, and for throwing it out at the side of the ditch. The plate, P, is only to incline the sod to the one side.

Two men take their position at the handle of the lever, facing the wheels. They press down the lever, which causes the spade to fly out, at the same time cutting the sod on three sides; then, raising the lever (without changing their hold,) forces the spade in, cutting the sod off at the bottom. The machine being now at the surface, swings forward seven inches, when the same operation is repeated, one sod pressing out the other, throwing them upon the side of the ditch. Or the lever can be extended across the axle, a man working at each end.

The machines can be made to cut ditches one, two, or three feet deep, and seven inches wide, or fourteen or twenty-one inches wide, by going over the ground twice or thrice, or wider by repeating the operation. It is comparatively easy work for two men. It is fitted to the large wheels of a single horse wagon.



It may be used to good advantage without the wheels and lever, by having attached to it a piece of wood two feet long, with handles, as represented in the small cut.—It cuts a ditch smooth on the sides and bottom.

Applications for machines or rights may be made to the patentee as above.

### CHANGE OF CLIMATE.—NO. II.

As far as my observation has extended, the change in the climate of our country has not resulted advantageously to us; indeed, I think it has been constantly growing worse and worse, as the "improvements" (clearings,) have been progressing. I am aware that nearly all who have written on the subject of the improvement, or clearing up of a country, have expressed a different opinion. But I am satisfied that it will be conceded by those most familiar with the facts, that the climate is not now as genial, and promotive of the *perfection* of plants and fruits, as it was sixty years ago. No large forests being left to check its force, the pierce "weslin" wind now wildly sweeps over the denuded face of the country, with the most searching scrutiny and effect.

The frosts are more frequent, and much more injurious to grains and fruits. In the winter, the winds drifts the snow off of the fields, which leaves the tops of the wheat plants exposed to the action of severe frosts, by which they are, oftentimes, entirely destroyed. From the same cause the roots of the plants are frequently broken, and the wheat is "winter killed." When the country was first settled, the grain being covered during the whole winter by a thick mantle of snow, was completely protected from injury by the alternate freezing and thawing processes which have lately been so destructive to the great staple of our country.—"Winter Killed" wheat was unknown here until many years after the first settlement

—even the top remaining as green in the spring as it had been in the previous autumn. And, occasionally, a fallow deer forfeited his life by his boldness in depasturing the wheat fields in the spring.

Fruit trees now put forth their blossoms and fruit earlier in the spring, in consequence of the *earlier* and *greater* effects of the sun's rays in warming the earth and air. Indeed, the autumn season is sometimes so mild and genial, that the buds are brought forward, almost to bursting, and are, during the winter, made the victims of a too confiding trust in the lurements of the delightful but precocious geniality of the weather. But if the buds escape destruction during the winter, after the trees have put forth their blossoms, containing the embryo fruits, there frequently comes "a frost, a killing frost," which destroys both blossom and fruit together—blights the hopes of the husbandman—and thus is rendered to him no return for his toil and labor in raising the trees. Who cannot produce a peach orchard that will remain in full growth and productive vigor, for twenty-five or thirty consecutive years, as did those which were planted by the first settlers?—I believe it cannot now be done, even by the most "scientific" and thorough course of cultivation.

The potato crop, too, has become a very uncertain one. The Rot, which has caused the recent failures, is, undoubtedly, owing to the greatly increased degree of heat from the change which I have mentioned. The more rapid the growth of the plants, the more tender are the leaves and tops: and the more likely to be affected by excess of heat. A greater degree of heat having occurred within the last few years, than formerly, the plants have been stimulated to an exuberant growth. And just at the time when they were "filling out" the tubers, the heat has been so severe as to kill the tender tops, leaves, and stems, in succession, and ferment (more or less,) the juices—the tubers, being "filled out" with the aid of the vitiated sap, rotted in the ground, as soon after being taken from it as sufficient heat, from any cause, was applied to them.

Wheat also "rusts," by rupture of the sap vessels, from the same cause—the excessive degree of heat falling upon a very rank growth of the plant, just as it is "filling out" the grain, ruptures the distended sap vessels. The loss of the sap prevents the grain from being "filled out," and it is said to be "shrunk." 'HIEL.

## AGRICULTURAL MEMORABILIA.

### COWS HOLDING UP THEIR MILK.

IT is well known that many cows when they first come in, when their calves are taken from them, will hold up their milk, sometimes to such a degree as almost to dry themselves before they will give it down.—"A few years ago," writes a correspondent of an English newspaper, "I bought a young cow, which proved to be very wild, and when I took away her first calf she would not give her milk. I had heard it remarked that putting a weight on the cow's back would make her give her milk down. I accordingly drove her into a stable, got a bushel of grain and put it on her back.—While in this position, she had no power to hold up her milk, for it came down freely. After doing this a few times, and afterwards putting my hand on the back of the cow, it would give way and she would immediately give down her milk." The rationale of this treatment appears to be that the weight counteracts the upward tendency of the animal's muscular action.

### GRASS UNDER TREES.

By sowing nitrate of soda, in small quantities in showery weather under trees, a most beautiful verdure will be obtained.—"I have used it under the beech trees in my grounds," says a writer in the Gardener's Chronicle, "and the grass always looks green. Having succeeded so well on a small scale, I have sown nitrate of soda amongst the long grass in the plantations, which the cattle never could eat. I now find that the herbage is preferred to the older parts of the field." Nitrate of soda can be purchased at less than three-fourths the expense of rough saltpetre. If sown among clover or other artificial grasses, and harrowed in, it will greatly assist the small seeds in getting out of the way of the fly.

### BALKY HORSES.

Balky, or jibbish horses, are not only a source of great annoyance, but too frequently endanger the property and peril the lives of their owners. An East India gentleman one day took his seat in one of the omnibuses, in London, but at the time of starting all the efforts of the driver proved unavailing, owing to a balky horse attached to the vehicle. The poor animal became more and more restive in proportion to the tortures inflicted upon him by the driver, and several other whipmen who assisted on the occasion. The street became blocked up with spectators, and the interception of other carriages. Great danger was to be apprehended. The East India gentleman, above referred to, suggested to the driver and his assistants, that if they would try the East India method of fastening a cord to the horse's fore-feet, and cause a person to pull forward, the animal would start right away. The suggestion was received with contempt. However, after all other efforts failed, a long cord was attached to the animals fore-feet, and the moment the man gave a strong pull the horse started off as if nothing had been the matter.—The philosophy of the case seems to be that the animal, thrown off the centre of gravity by the propulsion forward, is taken by surprise and obliged to start. Try it.

N. D. REDPATH.

## CONDENSED CORRESPONDENCE.

### A Plea for Dogs.

MR. EDITOR:—In the Rural of April 23d, '53, we find an article over the signature of Charlie Chestnut, on keeping dogs and borrowing newspapers. Now, if Phrenologists "say true," our combatativeness is not large, and we *know* we are not disposed to quarrel with any body—moreover, we concede without debate, that newspaper borrowing is utterly and entirely wrong, and should be condemned; but when it is proposed to *choke dogs* with newspapers borrowed, or *lent*, we demur.

Your correspondent asks two questions, viz., Do you borrow a newspaper? Do you keep a dog? Both these questions we can answer in the negative. We don't borrow a newspaper, don't keep a dog,—never did, and besides are not particularly *partial* to dogs in general; but why all the world and "the rest of mankind," are *growling* at the whole dog creation we cannot see. Why not let every dog "have his day?" Suppose they do get mad sometimes and refuse to drink water. Do not men, or those "who wear the human form," do the same? Do they not bite, or in some other way injure or destroy their children, their wives, their best friends? And are we not authorizing them so to do by licensing persons to sell rum? Bad as *some* dogs are, we had better be destroying the "serpent of the still," than "banishing" their keepers, even though they are guilty of the "unpardonable sin" of borrowing newspapers. There *have been* many good dogs, (and perhaps there are some yet,) whose good deeds are too well known to be commented upon here. We have fallen, and if dogs have fallen with us, why not let them take their chance with *the rest of us*. If man was as pure as he once was, a *look* from the "human face divine" would be sufficient to render submissive the most unruly cur. But men obey not the "higher law," and why should they expect dogs to obey them?

Our sage Supervisors, too, have decreed that dogs *must be* taxed, and if unable to raise the money when the collector shall call, they *may* suffer death. Imprisonment for debt was thought to be cruel, but in this progressive age we go still further. Again: the good dogs are compelled to suffer with the bad ones, but to this we do not object. They should, and will, take care of their race. All we want is to have the matter explained to them. Only let some one of our numerous Attorneys—one of those who "make the law at night more intricate than at the dawn"—"to-morrow farther from the close than when the sun last set"—give them the "modus operandi," and they will pay the tax even with their lives. They will.—TIM, *East Varick, N. Y.*, 1853.

### Prices of Fowls—Cochin Chinas in England.

MR. MOORE:—Notices of large prices obtained for fowls appear quite frequently in your city papers, and I discover in some quarters a disposition to place the Brahma Pootras in advance of all other varieties; and they have been so puffed as to command higher prices, in Western New York, than any others. While I have no disposition to quarrel with this fact, it is worthy of note that in England, where the rearing of fowls has received far more attention than in this country, and where the Cochin Chinas have been longest and best known, the latter command higher prices than any other variety, and higher than *any* variety brings in the United States. It was thought that prices could never go higher than they did last winter, at the London Poultry Show, at which £63 was required for four Cochin China fowls, and 30 guineas were *refused* for a single hen. At the same time, 110 young birds, between three and four months old, were sold for £269, and one pair brought £49 7s.

These prices were regarded as enormous. I have however just received a letter from London, from a most authentic source, written the present month in answer to inquiries in regard to fowls. The writer informs me that Cochin Chinas, no better, judging from the descriptions, than those of which you published portraits three or four weeks since, cannot be had for less than 50 guineas! And by the same mail I have an account of the sale of *one pullet*, hatched in August last, and the sale made in March, for the sum of 40 guineas. Two hundred dollars for a single young chicken *is* rather speculative. And yet I venture to express the belief that *good* Cochin Chinas will continue to bring such prices for two or three years to come. ONTARIO.

### The Osage Orange.

THIS recently discovered hedge plant seems to be gaining favor, and deservedly too, in all parts of the Union. Questions are frequently asked, does it sprout from the root? Will the tap roots grow? My experience is this:—It will sprout from the root, if the roots are broken by the plow or otherwise, and the ends left sticking out of the ground. The tap roots will grow if cut in several pieces and set with one end above the ground.

I regard the *Maclura Aurantiea*, or Osage Orange as emphatically *the hedge plant* of America, yet the utmost care is necessary in its cultivation, or it is worse than worthless. Four thousand plants to the mile is plenty for lopping, which I prefer, first, for its cheapness; second, for its neatness and symmetry of form; third, it saves ground; lastly, it grows more vigorously.—The cost per mile, will not exceed $50.—J. G. FISH, *Warsaw, Marathon Co., Ind.*

INFORMATION WANTED.—There are many agricultural tools advertised in your paper without any price attached, and we farmers do not like to travel forty or fifty miles to find out, and be disappointed. I think dealers and manufacturers would sell more if they gave the price of the article. I have been asked about the sub-soil plow, and more particularly the price of T. S. Stedman's Clover and Grass Seed Reapers,—this information inserted in the RURAL, would be thankfully received by many of your readers. W. N.

### How deep do Roots Grow?

MR. EDITOR:—I noticed in a recent number, a piece written by 'HIEL, purporting to be the correction of a *great* error—according to his phraseology—in regard to the depth to which wheat and other roots grow. I observed some years ago, where a cellar was dug in a growing field of wheat, that the roots, as washed by the rain, hung down the side of the bank at least four feet, and one of our farmers, in digging a cellar in a wheat field, states that he traced the wheat roots five feet in a stiff soil;—this I call demonstration. H.'s comparison of a seed deep in the ground, and one with vitality, appears to me very absurd—a seed deep in the ground, or a chicken in a new laid egg, needs no nourishment, but let vegetation, or incubation take place, nourishment is then required—and nature gives it power to seek that nourishment. In Prof. MAPES' Report to the American Institute, he states that he plowed with common and sub-soil plows thirty-five inches deep, and says the crops ever his under drains were the best, as being yet deeper.

In regard to trees, the road that passes my house is dug from five to sixteen feet deep on the side of a steep hill, with an orchard on the hill above, and I have seen the roots of these trees plowed up twenty feet from the trees, and ten feet below the surface; but those trees are not "forest trees," and about one-third the age that H. speaks of. I think H. has got one of these "hard-pan" sections we have heard so much of—and, if he is a farmer, I advise him to get a sub-soil plow, and break that hard crust, which would expand his purse, his mind, and the roots of his wheat.—W. N., *Alabama, N. Y.*

## AGRICULTURAL INTELLIGENCE.

### Monroe Co. Plowing Match.

IN consequence of the very severe storm, the Plowing Match was postponed, and is now appointed to take place at Churchville, Saturday, June 4th, on the farm of D. MCNAUGHTON. The Secretary of the Society, H. C. WHITE, writes us that, "there are strong indications that from forty to fifty teams will be on the ground, and that ample room, and good lands, will be provided for all who come. Plowing is a very important part of husbandry, and all farmers should see that it is done in the best manner. To do this the plow should be adapted to the work required. A trial of the different kinds at a match, offers a good opportunity to judge of their merits. If the farmers of Monroe County, come out with teams and plows, they may have the best plowing match ever held in Western New York. It is in contemplation to increase the premium list, which will make it over *forty dollars*.

Teams should be on the ground as early as ten o'clock as plowing must commence at *twelve o'clock precisely*. As soon as plowing is concluded the Society will adjourn to TUPPERS, for dinner, after which the premiums will be read, and *paid* the same afternoon. A large show of stallions, fine horses, cattle, sheep, and implements, will be on the ground for which premiums will be awarded according to previous notice."

## THE AGRICULTURAL PRESS.

### To Prevent the Potato Rot.

WE find the following, from H. PENOYER, Western Saratoga, Union Co. Ill., in the *N. Y. Tribune*:

Permit me to make known to the farming part of the community, a perfect cure and preventative of the "Potato Rot," having tested it thoroughly four years with perfect success. Take one peck of fine salt and mix it thoroughly with half a bushel of Nova Scotia Plaster or gypsum, (the plaster is the best) and immediately after hoeing the potatoes the second time, or just as the young potato begins to set, sprinkle on the main vines next to the ground, a tablespoonful of the above mixture to each hill, and be sure to get it on the main vines, as it is found that the rot proceeds from the sting of an insect in the vine, and the mixture coming in contact with the vine, *kills* the effect of it, before it reaches the potato.—Farmers would do well to try it, as they would be well paid for their trouble by the increase of their crop as well as the quality of the potato. *Try it and see.* I could, if necessary, furnish ample certificates to substantiate the above, but deem it unnecessary, as it needs only a trial to prove it.

### Oxen vs. Horses for Farm Work.

WE copy the following valuable article from the *Granite Farmer*. It is well worth considering by our readers:

Horse teams upon the farm with good rigging make such a fine appearance that many take a great fancy to them. And such persons generally manage in some way or other to persuade themselves that they are much more serviceable and more profitable than oxen. On this subject the experience of our friend Mr. Dewey is well worth considering.

FIRST COST.—In the first place, the cost of a good span of working horses, says Mr. D., is at least twice the cost of a good yoke of oxen. And the wagons, harnesses, and other rigging necessary, will cost more than twice as much as for oxen; $326 will not be more than enough to purchase two young and good working horses, with a wagon, cart rack, and other suitable equipments, while the sum of $160 will provide a choice yoke of oxen, and and a cart and wheels, and rack, and all else necessary for them in ordinary farm work.

COST OF KEEPING.—Then the cost of keeping horses is well known to be considerably more than the cost of keeping oxen, even if the latter are ever so well taken care of.—The blacksmith's bill is sure to be twice as much upon the horses, and then the wear and tear, and breaking of tools will go higher still. Horses are liable to numerous casualties. They get chafed, lame, sick or something else, ten times where a yoke of oxen is troubled once. If the horses are at all active and spirited, as they should be, they cannot well be trusted to any but a choice, careful teamster. Besides, hands are very apt to make them go sometimes with much more than useful speed. Now and then a horse is unharnessed from the plow where he has been hard at work in the field, and put upon the very top of his speed to the store, a mile or two off, to get a pipe or plug of tobacco, or some such indispensable article.

SERVICE DONE.—Oxen will do all kinds of farm work well, and many things altogether better than horses. For instance, starting out manure, hauling rocks, getting out wood, Mr. D. says that a strong yoke of oxen will do as much as a span of horses, if well kept, and oxen must be well kept to be profitable. Give the oxen the same keeping as the horses and they will follow them in plowing any length of time, provided the furrows be of equal depth, and they will do this through any weather, except the very warmest. The great fault of those who complain of the slowness of oxen, and their want of strength and endurance, is that they do not keep their oxen well. And another point of great consequence is that the oxen are put to work at a very early age, and before they have had time to gain their proper size and strength. Horses do not so often have their early growth checked in this way. Besides, calves are often so meanly fed that they are greatly stinted by that also.

KEEPING.—They should be kept so as to be always ready for the butcher. Mr. D. has a farm of 150 acres, 40 of which is in tillage. He uses no other cattle for labor except one yoke of large oxen. They are so kept and used that they are fit for the butcher through the hardest of the work.—During the first part of the winter, till March, they get hay in the morning, oat straw at noon, corn fodder at night. Later in the season they are fed with a peck of meal per day, with chaff or chopped hay, sometimes moist, in addition, and a bushel of turnips twice a week. The meal is made from corn and cobs—two bushel of cobs and one bushel of corn on the cobs, and perhaps a bushel in ten or twelve, of oats, are mixed ground together. Cattle do not feed so well on hay or grain alone, as on a mixture.—Vegetables are of great service to make them healthy. When Mr. D. fats cattle he gives them daily a bundle of green corn fodder in the summer and fall till frost comes, and then green turnips and beets thinned out of the field, and afterwards a bushel on turnips and a peck of meal, like that above mentioned, till sold.

THE PROFIT.—Allowing well fed oxen to be just about as serviceable as horses, besides the extra cost in the beginning, the repair of tools, the extra expense of shoeing, risk of lameness and disease, and the great care needed in managing, there are other things, that increase the profit of oxen.—The manure they make is more valuable.—The best kept horses will decrease in value $10 annually, take one year with another, while oxen will increase in value. Mr. D. never buys a yoke of oxen till about six years old. If they do not prove just the team desired, he sells them in a year and gets another pair. They will do well till 12 years old. His experience for the last 20 years is as follows: where is presented the first cost of the oxen, the number of years kept on the farm, and the price sold at.—And during that time the oxen have been the only team, for farm work, and have not in all been turned out from labor for the purpose of fattening, three weeks during the 20 years:

| Cost. | Time kept. | Sold at |
|---|---|---|
| $72 | About 6 years | $116 |
| 70 | " 1 " | 95 |
| 105 | " 5 " | 96 |
| 70 | " 1 " | 98 |
| 85 | " 3 " | 112 |
| 80 | " 3 " | 110 |
| 90 | " 1 " | 105 |
| $573 | | $731 |
| | Cost | 573 |
| | Profit | $158 |

### Fisher Ames on Orchard Grass.

THE *Evening Post* publishes the following pleasant letter from Fisher Ames, taken from his work, edited, and about to be published, by his son:

FISHER AMES TO CHRISTOPHER GORE.

DEDHAM, Nov. 7, 1852.

MY DEAR FRIEND:—The very hour and minute that I received and was reading your letter about Mr. Salisbury's experiments on my orchard grass seed, pronouncing it, on philosophical authority, to be coarse and unfit for pasture, my cows were in my house-lot eating it with the voracious appetite of ignorance. The Encyclopædia, I find, says it is liked by sheep and horses, but is *refused* by cows.

The poor things did not know that it was the "Dactylis glomeratus," and was refused by cows. It is a shame to the very cattle to be so ignorant. It was natural to expect dreadful consequences from this apparently fatal mistake.

The arts and sciences, who had spoken so plainly in the Encyclopædia, one would think, would send a witch to give my cows the cholic.

There was no temptation, and very little excuse for the blunder, for in the lot were other grasses in abundance. The honeysuckle, or white clover, the May and spear grass, and the other various sorts, or *gramina*, as we, the learned, choose to term them. Yes, rejecting what was good and lawful, and preferring that which, it turns out, though I must insist they did not know it, was prohibited, they did prefer the aforesaid "Dactylis glomeratus," against the dignity of the Royal Society and their botanical garden, and in contempt of the common law and of the Encyclopædia as before reiterated, and in very evil example to sundry other cows, who looked over my fence, desiring to offend in like manner. I will not wholly vindicate this enormity—it is too bad for that—but I urge in palliation, that probably the "Dactylis glomeratus" is as sweet as any grass that grows so rank, probably sweeter, for the *hay* is preferred by my cattle. But I can scarcely doubt that the white clover, and other small grasses, are better pasture. But, as the orchard grass grows very fast, while others stand still, and often form a tuft or hassock, in rich land, as large as a peck measure, unless the cattle love it *much better*, they will not keep it down so close. For, in an equal space of time, it will be ranker than other grasses, and being the rankest will, of course, be left. Yet, this very inconsiderable difference, supposing it to exist in favor of other grasses, which is, however, mere hypothesis, is an affair of trival account. As the orchard grass is succulent and cattle *will eat it*, their preference or taste is of no great importance to your own cows; if indeed you invite your neighbor's cows to push down your fence and breakfast in your lot, you should entertain them on the best.

The grass and hay are highly nourishing, they are abundant, and, with manure, bring better crops on dry lands than any other grass, perhaps not excepting clover.

The last spring I remarked my orchard grass grew thick and formed hassocks, while the dry cold weather kept all other sorts back.

On the whole, this species of grass is, with me, beyond the grade of experiment—it has tried excellence, and I will stick to it.

I have a great deal more to say to you. I am full of zeal about farming; cattle and fruit trees are my themes, in prose. Poetry, if I had any, I would devote to my pig-sty and politics—two scurvy subjects, that should be coupled together. I wish exceedingly to get such cows as, being well-fed on the "Dactylis glomeratus," will give more milk than any other cows.

The Alderney breed is said to be of that description, but being English, I make no doubt they would refuse the "Dactylis."—Expect to hear from me again very soon.

Your affectionate friend,

FISHER AMES.

THE Dispatch suggests that graduates from the Agricultural Colleges, now being started in this country, have affixed to their names the cabalistic letters "M. P."—meaning "Master of the Plow."

# Orchard and Garden.

### DUTCHMAN'S BREECHES.—(Dielitra.)

Don't smile, for we shall not write an essay on any portion of Mynheer's wardrobe. Our title is designed for another article—one of Flora's choicest vernal gems. Why it should bear such an uncouth name, is hardly explainable; perhaps from the quaint conceit of some very quaint person. Its botanical name is *Dielitra*, so-called from two Greek words signifying double wing case—in allusion to the curious shaped spurs of the flower. It is ranked in its natural affinities with the Fumeworts; *Fumariaceæ*. The characteristics of this family are herbaceous plants, with brittle stems; leaves very finely divided, often furnished with tendrils and irregular purple, white or yellow flowers. There are 15 genera and 110 species, many of them delicately beautiful. They generally love moist, shady thickets. Their home is in the temperate regions of the northern hemisphere.

The *Dielytra* is common in the Northern and Middle States, in moist woods. Its roots are bulbiferous or tuberiferous, those of the *D. Canadensis* being of a bright yellow and as large as peas—and known among school boys as "squirrel corn." It is a low, tender plant, some six and eight inches high; the leaves, which are all radical, are very finely divided; this, with their lively green alone makes them objects of much beauty. The flowers, which are ranged on a stalk springing from the root and rising a little above the leaves, are really pretty, though very odd looking. In color they are pure white, but sometimes tinged at the summit with light yellow. The corolla is composed of four petals, two of which are narrow and internal. The other two are compressed and equally spurred or gibbous-like at the base, and enclosing in the upper portion the other parts of the flower. These are arrayed on alternate sides of the scape, and present a nodding appearance. In one species, the *Cucullaria*, the spurs are about as long as the corrolla. In the *Canadensis*, the spurs are shorter and more obtuse.—Another species, the *Eximia*, is more rare, is larger, and somewhat branched. Its flowers are purplish. This is a very fine species—flowering in the summer months. The others bloom in May and June.

We have among our native flowers, a great many equally worthy a place in the amateurs list with more high sounding ones.—Whether the *Dielytra* would bear the change, we are not aware. At all events, it is worthy a trial, and might be found to surpass many that now receive attention. For delicacy it certainly has but few superiors.

T. E. W.

Muslin for Hot-beds.—I have used it two seasons by the side of glass and like it better. It has no scorching force, and by doubling at night, I have obtained healthier plants than under glass. It is much cheaper, saving sash entirely. I attach mine to a roller, in the form of an awning. I like it better than sash frames.—J. G. F., *Warsaw, Ind.*

### WASHING FRUIT TREES.

Washes for trees should have power and virtue enough in them to kill all the insects and grubs which harbor on them, and all the moss which gathers on the trunk.

If potash water, just strong enough to bear an egg, is thought to be too strong for the bark of apple trees, it may be very easily reduced by adding water—but nothing should be added to make it into a paste, for that will not leave the pores open.

Potash water, one gallon of water to a pound of potash, will kill the grubs and moss with which it comes in contact, and will not injure the bark of an apple tree one year old. This has been so long and so often tried, that there is no question about it among people of experience.

Now is the time of the year to find the eggs and the young maggots of the borer at the root of the apple tree. Old trees will bear a stronger wash than any we have recommended. Swab the tree well at the root, wherever borer maggots or borer eggs are found, with strong ley, and you kill them.—*Mass. Ploughman.*

### CURE FOR ROSE BUGS.

A subscriber wishes to know if any one can suggest a method of preventing the yearly incursions of the rose bug, and having heard considerable complaint among our neighbors of having their cucumbers, grapes and other fruit destroyed by these insects, I will suggest a remedy. Plant in the centre of your garden damask rose bushes, and they will never light on any thing else.—We have a large garden with almost every kind of fruit, vines, shrubbery, and flowers, with several kinds of roses, and in the centre we have four bunches of damask rose bushes, and I never saw in the whole garden a rose bug on any thing but the damask rose. When they are in blossom I go into the garden once a day with a pan of hot water, and get about a pint at one time; this I practice for a few days, and then they will disappear.—*Boston Cultivator.*

### ORNAMENTS FOR THE FLOWER GARDEN.

There is a mode of increasing the attractions of the flower garden during the summer months, which may be carried to a much greater extent than we see it introduced, and that at very small cost. We allude to the use of vases and rustic work, for placing upon lawns, at the extremities or corners of walks, in the center of large flower beds, and many other situations which the particular localities of a place may present as suitable for the purpose. These may be either of stone, earthen ware, or wood, and none are more effective than those formed of rough loppings of timber with the bark on; and they are of easy construction, as they admit of any diversity of form that may strike the mind of the constructer. For large conservateries, or grounds into which statuary is introduced, marble, or other stone vases, are the most appropriate, because they best sustain the character of these situations; but for the garden or pleasure grounds of a strictly rural nature, the rustic wood work is the most desirable. There are few adjuncts to a garden which will give more variety than those we are recommending—because, by placing in some plants of a rigid growth, such as the Agave, (or Aloe,) and the Yucca, and in others trailing plants, as Nasturtiens, Lobelia gracilis, Mignonette, and things of a similar description, a contrast is created with the herbaceous plants of the parterre, which is pleasing to the eye, and indicative of refinement in taste. Contrasts of color may also be rendered particularly effective by the judicious selection of different varieties to fill a vase or tazza—for instance a scarlet geranium in the center, with a purple or blue plant round the edge, such as Heroine or Mrs. Mills verbenas.

The varieties of the verbena alone, planted in a rustic basket or vase, and arrayed in circles, each one of a different color, present a beautiful object for several months together, and numerous other families, both annuals and perennials, may be advantageously employed in the same way.—*Country Gentleman.*

### HEADING THE CURCULIO.

Last spring I had two plum trees in my garden (and only two) that blossomed; about the time they were in full bloom I made a ring of tar around one, at a convenient distance from the ground, and then kept up a daily watch of the plums as they increased in size. When they had attained about the size of of a large pea, I discovered upon one or two, that the curculio had commenced its work. I then spread a sheet upon the ground, and gave two or three sudden jars upon the tree, and brought down two of the depredators, possum like, which I immediately despatched. Upon looking at the ring of tar, I found it had become sufficiently hard to admit any insect to walk over it with impunity. I then renewed the tar and kept it moist during the remainder of the season. I found no more curculios upon that tree, and the entire fruit (save the one or two plums injured by the insect) came to full maturity. The other tree (having dropped its fruit the year before, in consequence of the operations of the curculio) died before it was out of blossom.

Tar is probably the best thing that can be used to prevent their ascent, and in applying it, it would be well to first tie something around the body of the tree of sufficient size to prevent the tar from running down as much as possible, and to keep it moist and sticky during the season of the insect. It should be applied to every plum tree in the neighborhood, or the insect, after it has attained a sufficient size, can and will fly from one tree to another.—*Michigan Far.*

### CURIOUS DEVICE IN GRAFTING.

The gardeners of Italy sell plants of jasmines, roses, honeysuckles, &c., all growing together from a stock of orange, myrtle, or pomegranate, on which they say they are grafted. But this is a mere deception; the fact being, that the stock has its centre bored out so as to be made into a hollow cylinder, through which the stems of jasmines and other flexible plants are easily made to pass their roots intermingling with those of the stock. After growing for a time, the increase in the diameter of the stems, thus inclosed, forces them together, and they assume all the appearance of being united to one common stem.

Apples for milch cows.—Five minutes ago a gentleman, who deals in facts and figures, as well as fine cattle, informed us that he had fed out last winter more than two hundred barrels of sweet apples to his milch cows, and that the increased quantity and richness in quality of the milk paid him better than any other use to which he could have applied them. He states that he is raising trees annually, for the purpose of raising apples for stock. Another important statement of his, is, that since he has fed apples to his cows, there has not been a case of milk fever among them.—*N. E. Farmer.*

Young Trees.—Trees coming into blossom for the first time, should not be allowed to perfect much fruit. If it grows on the ends of the limbs it bends them out of shape and directs the sap from making wood into the fruit, while the growth of the tree is what is desired.

The Curculio.—Sift lime-dust over the plum and apricot trees when the dew is on them, and this little plague will not sting the fruit. Two or three sprinklings, at intervals of several days, will probably be sufficient. Try the same remedy on some of your apple trees.—*N. E. Farmer*

To each Heaven gives the place he best can fill.

### DON'T TAR YOUR TREES.

Don't tar your trees, or do any other foolish and unreasonable thing to them, because you have seen a neighbor do it—or because some anonymous, as well as enormous, fool may have recommended it in the "agricultural" department of some newspaper.—Last summer, we saw, one day, from our sanctum window, a man with a kettle of tar and a brush in hand, daubing with the dirty stuff the sprightly young Elms in front of the Biddeford House,—and on he went, with his kettle or brush, playing the same filthy trick with every tree up Adams Street.—Soon after, in looking over the fences of two or three of the fine gardens in the village, we noticed that young honest upright Fruit trees had been subjected to the same vile treatment. But we guess the owners saw where they "missed it," for it was not many weeks before we noticed the gardeners, with soap and cloths busily at work in cleaning the trees.

*Whitewashing* is another wrong practice, often inflicted upon trees. The effect of the lime upon the tree is decidedly bad—and an orchard, with all the tree trunks of a glaring white, has the impudent look of a fool. The color which nature has given a young apple tree, is the very best for the purpose, and all attempts at improvement, are futile. But above all else, dear reader, we beg of you never to "Tar your Trees."—*Biddeford Journal.*

### PEARS ON THORN STOCKS.

The present system of dwarfing fruit trees, which is said to be applicable to the pear as well as other varieties of cultivated fruits, removes, in a great measure, the objections urged against the thorn, by nurserymen. It has generally been asserted, and no doubt truly, that while the scion of pear does remarkably well, and makes a rapid growth on the thorn, the latter is not large enough to secure a good sized and healthy tree. But in dwarfing, the size is a secondary consideration. Very productive trees are obtained by this method, and they are very generally preferred in consequence of their being less liable to injury from winds, more easily managed, and requiring far less ground. Thorn stocks, also, are easily obtained, whereas quince stocks and pear stalks are expensive, and obtained only with difficulty, and from a distance, of those who grow them for sale, and at an exhorbitant price.—*N. E. Farmer*

Lawns and Grass Plats should be mown as often as once a fortnight, if it is desired to secure a fine, smooth turf.—*Ohio Cult.*

# Domestic Economy.

### THE WAY TO DRY HERBS.

There are few persons who would not be occasionlly benighted by a cup of good herb tea. I do not mean such as is made from herbs dried in the sun, and boiled for half an hour in an old tin cup. Such a *mess* as that would make even a well person sick, who had ever known a better plan.

By attending to the following directions, all country people can have good herbs; and if they wish to give a city friend some acceptable trifle in return for their dinner when they go into the city shopping, let them go up and carry a good bundle of various kinds of herbs, for in the city even a very small package costs sixpence, and a large proportion of stems at that.

All kinds of herbs should be picked as soon as they begin to blossom, the dust rinsed off, the leaves and flowers stripped from the stems and spread on tins or clear paper and exposed to a moderate artificial heat till perfectly dry and crisp, then put away in a clean dry place. When required, make the tea just as you would green tea for the table. Herbs are better dried in the shade than in the sun, but a moderate heat from the stove or oven is still better.

M. W. H.

Gum Arabic Starch.—We have often heard ladies expressing a desire to know by what process the fine gloss observable on new linens, shirt bosoms, et cetera, is produced, and in order to gratify them, we subjoin the following recipe for making Gum Arabic starch:

Take two ounces of fine white gum Arabic powder—put it into a pitcher, and pour upon it a pint or more of boiling water, according to the degree of strength you desire, and then having covered it let it set all night. In the morning pour it carefully from the dregs into a clean bottle, cork it, and keep it for use. A table spoonful of gum water, stirred into a pint of starch that has been made in the usual manner, will give to lawns either white or printed a look of newness, when nothing can restore them after washing. It is also good much diluted, for white muslin and bobinet.

To Keep Horseradish.—If you want to keep horseradish, grate a quantity while the root is in perfection, put it in bottles; fill the bottles with strong vinegar, and keep it corked tightly. You may thus have a supply at all seasons.

To Remove Sunburn.—Of scraped horse radish, take as much as will fill a tablespoon. Pour on it half a pint of warm milk, use it before washing, allowing it to dry on the skin, before applying the water. The milk may be cool, but will not keep fresh so long.

# Mechanic Arts, &c.

### LIST OF PATENT CLAIMS

ISSUED FROM THE UNITED STATES PATENT OFFICE

For the week ending May 24, 1853.

Hiram Berdan, of New York, N. Y., for improvements in machines for pulverizing auriferous quartz and amalgamating the gold.

Samuel R. Brick, of Philadelphia, Pa., for improvement in gas burners.

John B. Blair, of Alton, Ill., for improvement in an engraving machine.

Thomas H. Dodge, of Nashua, N. H., for improvement in kettle bails.

John C. Fletcher, of Burlington, Iowa, for improvement in radiators for stoves.

John Hartin, of New York, N. Y., for improvement in water meters.

Lewis Lupton, of Winchester, Va., for improvement in the construction of harrows.

Stanislas Millet, of New York, N. Y., for improvement in meat cutters.

Thos. Nelson, of Troy, N. Y., for improvement in watches and chronometers.

Jephtha A. Wagener, of Pultney, N. Y., for improvement in clover harvesters.

Alexander J. Walker, of New York, N. Y., for improvement in spirit lamps.

Madison Page, of Williamsburgh, N. Y., assignor to Samuel W. Hawes, Chelsea, Mass., for improvement in processes of distilling resin oil.

RE-ISSUE.

Cyrus H. McCormick, of Chicago, Ill., for improvement in Reaping machines. Patented, Oct. 23, 1847.

DESIGN.

Samuel D. Vose, of Albany, N. Y., for design for a parlor stove.

### NEW WASHING APPARATUS.

A writer in the Boston Transcript gives an account of a new mode of washing, which is well worth the attention of those who have large establishments to wash for. Indeed it would be convenient for little ones, too. If it does up the business as well and as rapidly as he says it will, it would be a good plan for neighbors who live near to each other, to club together and set up an apparatus for this business. The operating agent is steam—he says, that in the basement story of the St. Nicholas Hotel in New York, is a steam washing machine which operates in the following manner:

Four hundred pieces are thrown into a cylinder. This is thrown into rapid revolution by a small steam engine. Steam is then let into the cylinder under the water and clothes, which raises them out of the water, passing through the pores of the fabric, and out at the top of the cylinder. The clothes are then thrown down by the pressure of steam into the suds, and so on.—(We presume the steam must be let in, and let off alternately.—Ed.)

The changes thus produced by the rapid revolution, and by the passage of steam through the clothes, washes them perfectly clean in the space of ten minutes. The clothes are then thrown in a body into another cylinder, and wrung by the revolution of the cylinder, and then, by letting in hot air, which passes through the clothes, they are perfectly dried and ready for ironing in seven minutes.

The whole time occupied in washing, wringing, and drying, is seventeen minutes. The writer says the advantages of this apparatus are—first an immediate saving of time and expense in washing; second, the finest cambries can be washed without wearing them out or injuring the texture, as is necessarily done by rubbing in the usual way.—*Me. Farmer.*

### NEW SAFETY LAMP.

The number of accidents occasioned by the use of fluid lamps has induced a variety of inventions to prevent the explosions which have heretofore been by far too common an occurrence. A most effectual method for accomplishing this object has been invented by C. J. Conway, of New York City; for his invention Mr. C. forms a reservoir at the base of the lamp, into which the fluid is poured without bringing the fluid can near the burning lamp. This reservoir is then closed and the fluid conveyed by a small air-tight tube up to a chamber or small reservoir near the top of the lamp, from which there is no external opening except for the wicks. The upper end of the tube is bent in the form of a syphon with the curved portion placed in the top of the smaller chamber, so that the fluid cannot pass from the upper to the lower reservoir, but may pass from the latter to the former by simply inverting the lamp. The receiving reservoir being quite large, the upper reservoir may be filled several times without any new supply by the same process of inverting the lamp. The arrangement forms a very cheap, safe, and convenient article, and is also quite ornamental. Gustave Sellin, No. 27 Bowery, is the agent for manufacturing and selling, of whom further information may be obtained.

Machine for Making Paper Bags.—This machine is of French invention and manufacture. It is very compact, occupying a working space of only 5 feet by 4. With a small amount of power expended upon its working, and with a slight additional of manual labor, it will turn out complete, no matter what the strength or resistance of the paper, 20 large (in trade language 7 lbs.) bags per minute, and 12 large (from 12 lbs. to 28 lbs.) per minute. With the superintendence of two persons, after being put in motion, it will do the work of ten, the bags superior to those constructed by hand, inasmuch as they will stand open and upright.

### GIGANTIC STEAMERS.

A contract has been made in England for the construction of a mammoth steamer of upward of six hundred feet in length, and measuring 12,000 tons. The idea of a monster ship like this is not original with John Bull. Mr. Burden, of Troy, in this State, a man of wealth and a mechanic of original genius, some years ago suggested the construction of a steamer of 700 feet in length, and of corresponding depth and width, to run to Europe. Mr. Burden's idea was that it is practicable to construct a steamer which would go across the Atlantic with as little motion as our Brooklyn ferry steamers run to our sister city. He proposed that his steamer should draw seventy-five feet of water, and her top be an hundred feet above the water line. The maximum hight of the waves of the ocean from the bottom of the sea trough to the crest of the wave is estimated not to exceed thirty-five feet; hence Mr. Burden concluded that a vessel of seventy-five feet draught would always run on a nearly even keel.—There are but few ports where such a vessel could enter. On our coast, Newport offers the greatest facilities of a good harbor, with ease of access and abundance of water, and here Mr. Burden proposed to establish the head-quarters of his ship. No steps were ever taken to carry out the majestic idea of our countryman, and it is now broached on the other side of the Atlantic, and measures are taken to secure its realization. The proposed British ship is to be propelled by two sets of side-wheels and a screw at the stern, having, we presume, three independent engines and sets of machinery. The experiment of running a steamer of such gigantic proportions will be watched with intense interest, and, if successful, will mark a new era in navigation.—*Tribune.*

### STEREOTYPE MOULDS.

At a late meeting of the Scottish Society of Arts, Daniel Wilson, LL. D., described and exhibited the new process introduced by him to the notice of the Society, which consists in taking the casts of the types, not in gypsum or stucco, but in blotting paper, overlaid with a thin layer of whiting, starch and flour paste, covered with a sheet of tissue paper, and impressed on the types by means of beating it with a fine brush. It is then dried on a hot steam-chest, while still adhering to the types; and by this means a matrix is produced, and the types are again ready for distribution by the compositors within an hour. The advantages, he said, of the new process, are,—1st. The greater certainty of the process; the new matrix not being liable to warp or break, as the stucco is, or to remain in the smaller interstices of the types, so as to require revision by the picker. 2nd. The greater rapidity, the process being completed in one hour by it, which could not be done in less than six by the other. 3rd. The practicability of using the matrix in certain cases for casting several plates; whereas, the stucco mould is always destroyed in a single casting.—4th. The much greater simplicity of the apparatus required; which, added to the economy of time, and the consequent diminution of the quantity of type required for the compositors, give the important economic results which form the great merit of the new plan. A mould was made, and a cast taken, in presence of the meeting.—*Edinburgh Courant.*

### GRAIN SEPARATORS.

An improvement in grain separators has been invented by John Bean, of Hudson, Mich. The improvement is made upon the common wind or fanning mill, whereby the coarse foreign materials are extracted from the grain before being subjected to the blast of the fan wheel, thus the grain is better prepared for the action of the air and screen sieve. The means by which this object is effected is by placing in the centre of the upper sieve a forked guide, with its point towards the hopper containing the chaff and grain, and two spouts, one near each of the outer corners of the upper sieve, and placing beneath the sieve a thin metallic plate, corresponding in size with the size of the sieve, so as to prevent the current of air striking the grain until it has passed from the upper sieve and plate to the screen sieve, thus effectually cleaning the grain, first by sifting and separating, and afterwards by thoroughly expelling the dust and finer particles by the air blasts. The inventor has taken measures to secure his improvement by patent.

### GUM FROM STARCH.

The Annals of Science gives the following as the process of manufacturing the gum that is used for sticking letter stamps:

Take wheat starch, (not corn,) and pulverize it thoroughly, so as to make it as fine as possible: place this in a clean iron vessel over hot coals, sufficient to raise the temperature to about 400 deg., Fahrenheit, and stir the starch to prevent its burning or adhering to the iron vessel. In a few minutes it will be seen that the starch has become of a very light grey color, resembling in appearance, powdered slippery elm bark, or pulvis Ipecacuanha. The process is now completed, and the prepared substance may be put up in jars for future use. This substance is called by Chemists, *Leiocome.*

To make the gum or paste, mix this powder intimately with water and raise the temperature gradually to a boiling point.—The mixture then becomes semi-transparent and is fit for use. It is much more adhesive than any of the gums, and is the best article for paste that I have ever seen.

He that would eat the kernel, must not complain of cracking the nut.

# Educational.

## PUBLIC SCHOOLS OF ROCHESTER.

We are indebted to the Superintendent of Schools of this city, R. D. Jones, Esq., for his recent Annual Report, made to the Board of Education and by them published. Rochester has abundant reasons for being proud of her noble Schools, which, under the management of the present efficient Board, aided by the untiring efforts of the excellent Superintendent, promise to equal any schools in the country.

The usefulness of the Schools have been somewhat curtailed from the want of authority on the part of the Common Council to raise a larger amount of money for their support, and the Board have for this reason been unable to meet the wants of the scholars, who were seeking instruction. The Legislature having authorized the raising of a larger sum, it is in contemplation to increase the number of districts, erect more houses, and by every means in their power, to furnish increased facilities for the education of the children of Rochester. The attention of the public has been painfully awakened to the large amount of juvenile crime and wickedness in our midst, and it is to be hoped, some efficient and salutary measure will be adopted to not only prevent its increase, but act as a reformatory power for that which already exists.

The number of children of school age is reported at 12,824, being an increase of 312 during the year. Of this number, some 6,500 have attended the public schools some part of the year, and 2,461 are reported as being taught in private schools,—leaving a balance of over 4,000 who do not attend any school at all. Some of these are employed in the various shops, and callings, but far too many are allowed to run at large without restraint of any kind, at home or abroad, and are thus growing up, probable candidates for situations in the House of Refuge or the prison. Many of this number, we regret to say, are girls, some of whom are to be met with at every crossing, contracting habits and tastes which cannot result in any thing save their utter ruin.

It is indeed time the public were awakened to the condition of the rising generation among us, and led to take measures which will prevent the next generation from being exposed to so many evils and temptations. An education will do much by preparing the young for usefulness, and we do not speak at random when we assert that no city in the Union has public schools of a higher grade, so far as the moral and religous influence is concerned, than our own. We do not mean to say they are theological or sectarian, but in the good work of inculcating duty, obedience, virtue and good morals, for their beneficial influence upon the possessor, they are deserving of all encouragement and support. We commend the Report, and particularly the closing portions, to all interested. †

## COUNSELS TO CHILDREN.

BY HORACE MANN.

*You were made to be clean and neat in your person and in your dress, and gentlemanly and ladylike in your manners.* If you have not been bitten by a mad dog, don't be afraid of fresh water. There is enough water in the world to keep everybody clean; but there is a great deal of it never finds its right place. In regard to this article there is no danger of being selfish. Take as much as you need. The people of the West boast of their great rivers—I would rather they would boast of using a large tubful of their water every day.

Contract no such filthy and offensive habit as chewing or smoking tobacco. So long as a man chews or smokes, though a very Chesterfield in every thing else that pertains to his appearance, he can never be *quite* a gentleman. And, let me repeat it, you were made to be neat. While cotton cloth can be had for six cents a yard, there is no excuse for not having a pocket-handkerchief.

*You were made to be kind, and generous, and magnanimous.* If there is a boy in the school who has a club foot, don't let him know that you ever saw it. If there is a poor boy with ragged clothes, don't talk about rags when he is in hearing. If there is a lame boy, assign him some part of the game which does not require running. If there is a hungry one, give him a part of your dinner. If there is a dull one, help him get his lessons. If there is a bright one, be not envious of him; for if one boy is proud of his talents, and another is envious of them, there are two great wrongs, and no more talents than before. If a larger or stronger boy has injured you, and is sorry for it, forgive him, and request the teacher not to punish him. All the school will show by their countenances how much better it is to have a great soul than a great fist.

*You were made to learn.* Be sure you learn something every day. When you go to bed at night, if you cannot think of something new which you have learned during the day, spring up and find a book, and get an idea before you sleep. If you were to stop eating, would not your bodies pine and famish. If you stop learning, your minds will pine and famish too. You all desire that your bodies should thrive and grow, until you become as tall and large as your fathers or mothers, or other people. You would not like to stop growing where you are now—at three feet high, or four feet, or even at five. But if you do not feed your minds as well as your bodies, they will stop growing; and one of the poorest, meanest, most despicable things I have ever seen in the world, is a little mind in a great body.

Suppose there were a museum in your neighborhood, full of all rare and splended curiosities—should you not like to go and see it? Would you not think it unkind if you were forbidden to visit it? The creation is a museum, all full and crowded with wonders, and beauties, and glories. One door, and one only is open, by which you can enter this magnificent temple. It is the door of knowledge. The learned laborer, the learned peasant, or slave, is ever made welcome at this door, while the ignorant, though kings, are shut out.

## THE FLOGGING OF A PRINCE.

The London correspondent of a North German paper, relates a story with regard to the way in which Prince Albert punishes his children, which *The Tribune* translates as follows:

"The young prince stood one day in his room in the royal palace at Windsor, at the window, whose panes reached to the floor. He had a lesson to learn by heart, but instead was amusing himself by looking out into the garden, and playing with his fingers on the window. His governess, Miss Hillyard, an earnest and pious person, observed this, and kindly asked him to think of getting his lesson. The young prince said:—'I don't want to.' 'Then,' said Miss Hillyard, 'I must put you in the corner.' 'I won't learn,' answered the little fellow resolutely, 'and won't stand in the corner, for I am the Prince of Wales.' And as he said this, he knocked out one of the window panes with his foot. At this, Miss Hillyard rose from her seat and said,—'Sir, you must learn, or I must put you in the corner.' 'I won't,' said he, knocking out a second pane. The governess then rang and told the servant who entered, to say to Prince Albert that she requested the presence of his Royal Highness immediately, on a pressing matter connected with his son.

The devoted father came at once, and heard the statement of the whole matter, after which he turned to his little son and said, pointing to an ottoman, 'sit down there, and wait till I return.' Then Prince Albert went to his room and brought a Bible.—'Listen, now,' he said to the Prince of Wales, 'to what the holy Apostle Paul says to you and other children in your position.' Hereupon he read Galat. iv. 1 and 2:—'Now I say that the heir, so long as he is a child, differeth nothing from a servant, though he be loved of all; but is under tutors and governors until the time appointed of the father.' 'It is true,' continued Prince Albert, that you are the Prince of Wales, and if you conduct yourself properly, you may become a man of high station, and even, after the death of your mother, may become King of England. But now you are a little boy, who must obey his tutors and governors. Besides, I must impress upon you another saying of the wise Solomon, in Proverbs xiii, 24:—'He that spareth his rod, hateth his son; but he that loveth him chasteneth him betimes.' Hereupon the father took out a rod, and gave the heir to the throne of the weightiest empire in Christendom a very palpable switching, and then stood him up in the corner, saying, 'You will stand here and study your lesson till Miss Hillyard gives you leave to come out. And never forget again that you are now under tutors and governors, and that hereafter you will be under a law given by God.' This, adds the correspondent, is an excellent Christian mode of education, which every citizen and every peasant who has a child may well take to his heart as a model."

—It may be proper to add that the youngster who is represented to have received this parental admonition is but eleven years old.

## DISCIPLINE IN CHILDHOOD.

Young people who have been habitually gratified in all their desires will not only more indulge in capricious desires, but will infallibly take it more amiss, when the feeling or happiness of others require that they should be thwarted, than those who have been practically trained to the habit of subduing and training them, and consequently will, in general, sacrifice the happiness of others to their own selfish indulgence. To what else is the selfishness of princes and other great people to be attributed? It is in vain to think of cultivating principles of generosity and beneficence by mere exhortation and reasoning. Nothing but the practical habit of overcoming our own selfishness, and of familiarly encountering privations and discomfort on account of others, ever enables us to do it when required. And therefore, I am firmly persuaded that indulgence infallibly produces selfishness and hardness of heart, and that nothing but a pretty severe discipline and control, can lay the foundation of a magnanimous character.—*Lord Jeffrey.*

Early to Church.—Mrs Chapone was asked why she always went so early to church? "Because," said she, "it is part of my religion never to disturb the religion of others."

Solon made idleness a crime; and insisted that each citizen should give an account of the manner of getting his livelihood.

Men always express contradictory opinions when they attempt to explain things which are incomprehensible.

## THE CONDOR.

The Condor forms the type of a genus, a second species of which is the king of the vultures, of British writers. They are both peculiar to the New World, but approach, in their most essential characters, very closely to the vultures of the Old Continent, differing from the latter principally in the large fleshy, or rather cartilaginous caruncle, which surmounts their beaks; in the large size of their oval and longitudinal nostrils, placed almost at the very extremity of the cere; and in the comparative length of their quill feathers, the third being the longest of the series. The most important of these differences, the size and position of their nostrils, appears to be well calculated to add to the already highly powerful sense of smell possessed by the typical vultures, and for which these birds have been almost proverbially celebrated from the earliest ages. There is also a third species, the Californian vulture, rivalling the condor in bulk, and agreeing, in every respect, with the generic characters of the group, except in the existence of the caruncle, of which they are entirely destitute.

In size the condor is little, if at all, superior to the bearded griffin, the lammergeyer of the Alps, with which Buffon was disposed conjecturally to confound it, but to which it bears at most but a distant relation. The greatest authentic measurement scarcely carries the extent of its wings beyond fourteen feet, and it appears rarely to attain so gigantic a size. M. Humboldt met with none that exceeded nine feet, and was assured by many credible inhabitants of the province of Quito, that they had never shot any that measured more than eleven. The length of a male specimen, somewhat less than nine feet in expanse, was three inches from the tip of the beak to the extremity of the tail; and its height, when perching, with the neck partly withdrawn, two feet eight inches. Its beak was two inches and three-quarters in length, and an inch and a quarter in depth, when closed.

The Condor has been observed throughout the whole range of that immense chain of mountains which traverses the continent of South America, from the Straits of Magellan to the seventh degree of north latitude. It appears, however, to be much more common in Peru and Chili, than in any other part of the chain, and is most frequently met with at an elevation of from ten to fifteen thousand feet above the level of the ocean. Here, in the regions of perpetual snow, they may be seen grouped together to the number of three or four, but never in the large troops in which the true vultures sometimes assemble, on the bold points of the jutting rocks, many of the most remarkable of which are designated by the natives with names derived from the bird that haunts their pinnacles It is only when driven by hunger, that it descends into the plains, which it quits as soon as its appetite is satiated, unable, as it would seem, to support for any great length of time the increased weight of the atmosphere and the warmer temperature of the lower world. On such occasions, it rarely perches on the branches of the trees, but generally takes up a position on the ground, for resting on which its comparatively straight talons are peculiarly fitted. It is said that the female bird builds no nest, but deposits its eggs upon the bare rock without protection of any kind. These eggs are stated to be perfectly white, and three or four inches in length. The female is also said to remain with her young for a whole year.

The habits of the condor partake of the bold ferocity of the eagle, and of the disgusting filthiness of the vulture. Although, like the latter, it appears to prefer the dead carcass, it frequently makes war upon a living prey; but the gripe of its talons is not sufficiently firm to enable it to carry off its victim through the air.—*Library of Natural History.*

## ROMANCE OF INSECT LIFE.

We make the following extract from an Historical Lecture by Judge Charlton, of Georgia:

"The earth teems with mysteries; the sky shines with them; they float in the air; they swim in the deep; they flash from the dark robed clouds; they whisper in the gentle tones of the summer wind; they speak in trumpet tongues, in the voice of the tempest and the thunder. Cease thy longings for the ancient days, oh dreamers! Close thy book and look about thee upon the volume of Nature. See there before thee is a tiny insect that thou canst scarce distinguish from the grains of sand that surround it.—Watch it; it moves on with an energy and an instinct that enables it to overcome or avoid all obstacles. See; it has seized some object larger than itself, and still it goes bravely on; nothing daunts it; tread it under foot (if thou canst have the heart to attempt such a murder) and it will rise up again beneath the ocean of sand and turn once more to its labor. Dost thou know it? It is the ant, the lion hearted ant, toiling in the heat of summer; and though the season's brightness and its warmth are bringing up and producing ten thousand enjoyments for the little traveller, he is busy gathering together the provender for the long winter time, when frost and snow, and cold shall have locked up the granaries of nature.

Thou wilt tell me that I am mocking thee; that thou canst see this daily and hourly; and is this a mystery, therefore? If thou hadst read in those ancient legends before thee, of an insect so courageous, that it would attack an animal of ten thousand times its magnitude; of industry so indefatigable that it would climb house tops and mountains to pursue its course; of perseverance so unflagging, that though repulsed a thousand times, it still would return and overcome the obstacle that impeded it; the eye would have sparkled with interest and amazement; it is because it is constantly before thee; because it belongs to the present time; that thou lookest so disdainfully upon it. When did their bosoms beat so high with valor and determination as this poor insect? "But it has no loves, no burning jealousies, no blood-stained victories!" How knowest thou that? I warrant thee, even that tiny breast has grown gentler to some fond one that lived within its little world!—that its blood has moved quicker when some Adonis ant has flitted around the little coquette—that its path has been stained by the trophies of its mimic battles.

But thou wilt say, why dost thou lure me from my glowing page, to point me to this moving atom? Why not show me the majestic mysteries of nature? Why waste my time with a topic so insignificant? I answer, because it is insignificant. I point thee there one of the smallest of Earth's creatures to ask thee if the atoms contain such wonders, how much more noble and lofty are the works of nature? Follow me if thou wilt. Let us dive into the caverns of the Earth, and mark the sculptured halls; the rocky avenues stretching miles below the busy haunts of men. Let us plunge into the deep, and see the huge leviathan sporting amid the waters; or the rainbow-hued dolphin, as she flings back bright rays of the glorious sun. Let us climb into the air, and behold the eagle with his untiring wing, and his unflinching eyes, the noble image of indomitable perseverance and of brilliant genius soaring proudly and gazing fixedly toward Heaven's brightest luminary! Oh, dreamer! if the moments of thy life were multiplied by the sands of the desert, they would be all too short to unravel these mysteries that are around thee and above thee."

## WHY ARE WE RIGHT-HANDED?

Sir Charles Bell on this subject observes, that "for the conveniences of life, and to make us prompt and dexterous, it is evident that there ought to be no hesitation which hand is to be used, or which foot is to be put forward; and that there is indeed no such decision, is it taught us, or is it from nature? There is a distinction in the right side of the body; the left side is weaker, both as to muscular power and its constitutional properties. The development of the organs of motion and action is greater on the right side, as may be proved by measurement, or the opinion of the tailor or shoemaker. This superiority may be said to result from the more frequent use of the right hand and foot. But whence the origin of this use or practice? It has been said children are taught by parents and nurses to use the right-hand—but not always. Besides, this peculiarity is constitutional: disease attacks the left side and members more frequently than the right. In walking behind a person, we seldom see an equalized motion of the body; and we may observe the step with the right foot, that the toe is not so much turned out as the left, and that a great push is made with it. From the form of females, and the elasticity of their step resulting more from the ankles than the hip, the defect of the left foot is still more apparent. We do not often see children hop on their left foot.—May it not be considered then, that everything in the convenience of life being adapted to the right-hand, is not arbitrary, but is owing to a natural endowment of the body, that the right-hand is stronger and better fitted for action?" We conclude, therefore, that the preference for using the right-hand rather than the left, is not the effect of habit merely, nor adventitious, but is a provision of nature. The theory is not, indeed, universally received. The skilful anatomist alone can decide. If there are peculiar properties or mechanism to justify the opinion, it affords a new proof of wise and benevolent design in the "form of our bodies," and of our being "wonderfully made."

# Sunday Reading.

## THE VOICES AT THE THRONE.

BY T. WESTWOOD.

A little child,
A little meek-faced, quiet, village child
Sat singing, by the cottage door at eve,
A low, sweet, Sabbath song. No human ear
Caught the faint melody—no human eye
Beheld the upturned aspect, or the smile
That wreathed her innocent lips the while they breathed
The oft-repeated burden of the hymn,
"Praise God! praise God!"

A Seraph by the Throne
In the full glory stood. With eager hand
He smote the golden harp-strings, till a flood
Of harmony on the celestial air
Welled forth, unceasing. Then with a great voice,
He sang the "Holy, Holy, ever-more,
Lord God Almighty!" and the eternal courts
Thrilled with the rapture, and the hierarchies,
Angel, and rapt archangel, throbbed and burned
With vehement adoration. Higher yet
Rose the majestic anthem, without pause,
Higher, with rich magnificence of sound,
To its full strength; and still the infinite heavens
Rang with the "Holy, holy, evermore!"
Till trembling from excess of awe and love,
Each sceptred spirit sung before the Throne,
With a mute hallelujah. But, even then,
While the ecstatic song was at its height,
Stole in an alien voice—a voice that seemed
To float, float upward from some world afar—
A meek and child-like voice, faint, but how sweet!
That blended with the seraph's rushing strain,
Even as a fountain's music with the roll
Of the reverbrate thunder. Loving smiles
Lit up the beauty of each angel's face
At that new utterance. Smiles of joy that grew
More joyous yet, as ever and anon
Was heard the simple burden of the hymn
"Praise God! praise God!" And when the seraph's song
Had reached its close, and o'er the golden lyre
Silence hung brooding—when the eternal courts
Rung but with echoes of his chant sublime,
Still through the abysmal space, that wandering voice
Came floating upward from its world afar,
Still murmuring sweet on the celestial air,
"Praise God! praise God!"

## ONLY JUST INSIDE THE FENCE.

"Oh!" cried the little children. "Oh, such beautiful flowers! and only just inside the fence!"

And then stealthy glances were cast up at the windows, the gate pressed softly, the beautiful flowers were snatched with a trembling hand, and the little children fled away with trembling hearts. Were they now happier, because their guilty feet had wandered into forbidden paths? Only a little way had they gone, and too, they had fallen into sin!

The freshness, the fragrance, the beauty of the flowers, were not sufficient to still the remorseful whisper of conscience. *It was only just inside the fence* they had been, yet what an ugly mark had sin set upon their fair brows!

Poor little children are we all. Forbidden pleasure smiles and beckons to us, *only just inside the fence.* Our longing glances linger there; our feet stray thitherward—it is a little way, no one sees us, and we put forth our hands, and pluck the flowers whose fatal beauty is a snare to the soul.

Only just inside the fence! But that fence is set between us and sin. One side of it we may walk safely in the "King's Highway," the other side leads us to temptation, to folly, to crime. Once when we have set our feet in the forbidden paths, we go again more boldly, till the time comes when that fence, set for our safety, is broken down and destroyed by our reckless indulgence in evil desires. There is no longer a barrier between us and sin. We do not pause, or look round stealthily, or tremble as we grasp the coveted pleasure; our looks are grown insolent and defiant, the guilty blood mantles not on our cheeks at the detected fraud, the selfish indulgence, the debasing irreverence. The fence is broken down, and we wander unrestrained, farther and farther on those inviting paths, whose fatal termination is the snare, the pitfall, the abyss of darkness and eternal despair.

"*Such beautiful flowers!*" Turn from them, touch them not, they are forbidden.

"*Only just inside the fence!*" Within that fence is *sin*, without it, is *safety.*—*Cambridge Chronicle.*

## HEBREW GENEALOGIES IN THE BIBLE.

Genesis, ch. 5.—The Rev. Dr. Cumming says, curiously, that "it is a remarkable fact that the names which are given in this chapter of memories and epitaphs, when literally translated from the Hebrew, contain a prophecy of the gospel of Christ, each one containing a great and blessed truth.

"Adam is the first name, which means, man in the image of God; Seth, substituted by; Enos, frail man; Cainan, lamenting; Mahalaleel, the blessed God; Jared, shall come down; Enoch, teaching; Methusalah, his death shall send; Lamech, to the humble; Noah, rest, or consolation.

"It is thus that if you take the whole of the names, and simply in the order in which they are recorded, you have this truth stated by them:

"To man, once made in the image of God, now substituted by man frail and full of sorrow, the blessed God himself shall come down to the earth teaching, and his death shall send to the humble consolation."

This is just an epitome of Christianity.

Said one to an aged friend, "I had a letter from a distant correspondent the other day who inquired if you were in the land of the living." "No," replied the saint-like, venerable man, "but I am going there.—*This* world is alone the world of shadows; and the eternal is the only one of living realities."

The suppression of a truth is a real lie, when it is done with the intention to deceive him who asks a question.

# Miscellaneous.

## THE WIDOW AND HER SON.

BY F. B. GRAHAM.

HERE Willie, on this grave we'll sit
And see the sun go down;
For it is good an hour to spend
Out of the busy town.
Come sit thee by my side, my boy,
Upon the soft, green grass,
And watch the evening shades, and catch
Sweet odors as they pass.

Draw closer to me, now, and place
Your little hand in mine,
And look up softly in my eyes,
That I may look in thine;
For they are bright and beautiful
As thy dear father's were,
And as I gaze, methinks I seek
*His* love-light beaming there!

And, Willie, sing the little song
He taught you ere he died;
You used to sing it all day long
While sitting by my side;
But now you're fatherless, your voice
In song is seldom heard,
And you seem sad and lonely as
A young, forsaken bird.

Now sing it once again, my boy,
In your fond mother's ear—
Your father sleeps beneath—but oh!
He never more will hear
Those sweet, melodious, flute-like tones
That pleased him so, when life,
And hope, and happiness, were his,
With Willie, and his wife.

You cannot sing! Ah, no, my child,
Those tears must freely flow;
But pardon me if my sad strain
Has set you weeping so.
Your mother would not cause you pain,
Nor sadden your young heart;
But see, the sun is getting low,
And we must now depart.

Oh, often, Willie, may you come
And sit, in after years,
Upon this grass-green grave, and shed
A few unbidden tears.
And should your mother leave you, too,
You'll lay her by his side,
And then this spot to you will be
A home at eventide!

Written for Moore's Rural New-Yorker.

## USES OF ADVERSITY.

THE time has not yet been, and may never be, when man will be compelled to seek opportunities for subjecting himself to that indurating process known as self-discipline, and supposed to confer the power of rising superior to the ills and reverses incident to this life. For, indeed, he is not placed here upon a bed of roses, to dream away existence, his senses steeped in their delicious fragrance; incitements to labor are presented by his physical necessities, and, in the struggle for means wherewith to answer those wants, obstacles confront him at almost every step, to nobly and gracefully surmount which, brings into requisition all the philosophy he can possibly command. That sentimental sort of discipline, then, which is acquired for its own sake, often to the neglect of improving occasions inviting the exercise of self-denial for the benefit of others, involves an expenditure of time and energies quite disproportioned to the results obtained; for it is sufficiently obvious that, in general, this kind of theoretical, rule training fails to give the necessary preparation for conflict with the stern actualities of this rugged life. Since then, trials, material or spiritual, are the inevitable portion of humanity, we may conclude that the infliction of them is not capricious, but that they are designed to answer some important end; and consider a few of the more apparent benefits resulting from a patient endurance of them.

There is nothing like adversity to teach self-reliance. Though the gentle dew and the glad sunshine are indispensable to the growth of the saplings, the storm and the tempest, if they be not so severe as to uproot it, serve to add strength and firmness. He who floats lazily along on the surface of being, relying on others to help him easily over the rough places he may chance to encounter, shuts himself out from an enjoyment of one of the proudest, fullest pleasures within the reach of mortals—an acquaintance with his own individual resources; while he who genially accepts whatever adverse fortune bestows, with serene philosophy seeks to extract all of good he can from each dispensation, and manfully battles hand to hand with his turbulent passions, soon learns to estimate at its true value foreign support, and to know how much he is worth to himself.

There is no severe test of the genuineness of professions of friendship; and is it not a rich recompense for more than one temporary failure, to know that there are those who will cling to us in success and in defeat, and whom nothing but our own unworthiness can ever alienate? Evergreen friends, like evergreen trees, are apt to be undervalued in the summer time of fortune; we do not discriminate between them and the transient creatures with whom they are mingled; but winter brings them into striking, though grateful contrast with the surrounding barrenness and desolation, and then we learn to appreciate them.

It is of marvelous aid in the attainment of a lofty magnanimity; a quality on which every day makes fresh demands; for it is a mistaken notion that only great crisis afford opportunities for the exercise of heroic action, and no doubt would-be heroes, or those who think they would be if circumstances were favorable to a manifestation of their self-sacrificing natures, in sighing for such chances pass over hundreds of occasions, though obscure ones, the right improvement of which would enable them to display a far greater amount of true heroism than the much-desired splendid opportunity could call forth. Thus, it is not only in bravely meeting and successfully combating with extraordinary difficulties, that the man vindicates his right to the title of hero: it is comparatively easy for one to do a so-called great action when the eyes of all the world are turned toward him in high expectation, prepared to applaud his success, or to hiss at his failure; pride gives him in many cases an unnatural courage; the desire to equal or exceed what is demanded of him, raises to an extravagant pitch his contempt of danger, and creates a certain wild enthusiasm that carries him triumphantly through difficulties his unaided strength would never have sufficed to conquer.

But its crowning office is to lead the truant soul to the only safe haven of rest. The most fiery, rebellious heart must finally be tamed by the teachings of adversity and tempered to a sweeter, more gradual course; while the plastic, yielding spirit is schooled to a yet serener, more implicit trust in the hand that mercifully heals the wound itself inflicts. And, to the man of right intentions, what inexpressible happiness is afforded by the thought that, however misunderstood by his fellows, and however much the purity of his motives may be questioned, there is One above who knoweth the heart; and, musing upon this theme, I am led to wonder that we are not drawn to seek more intimate communion with Him, since He is the only one to whom we can be thoroughly known.

As clouds serve for a break-light to the intense brightness of the sun, so misfortunes and afflictions veiling the ineffable splendors of the Divine face, enable us to look with steadier gaze, on that countenance whose light will be our life and joy, when Time shall be merged in Eternity. A.

South Livonia, N. Y., May, 1853.

## INDIAN CREDULITY.

CAPT. MARCY, it will be remembered, was supposed, about a year ago, to have been cut off while exploring the head waters of Red river. He survived, however, and has lately read an interesting paper before the American Statistical and Geographical Society, describing the region of country which he visited, and particularly its Indian occupants. The following incidents will illustrate the difficulty of explaining modern discoveries to an Indian of the prairies:

"Having upon one occasion a Delaware and a Camanche with me, in the capacity of guides, I was much diverted at a conversation which passed between them, in my presence, and which was interpreted to me by the Delaware.

It appeared that the latter had stated to the other the fact of the sphericity of the earth's surface. This idea being altogether new and incomprehensible to the Camanche, was received with much incredulity, and, after gazing for a moment at the Delaware, to ascertain if he was sincere, he asked if that person took him for a child, or if he looked like an idiot? The Delaware said no, but the white people, who knew all about these matters, had ascertained such to be the fact; and he added, that the world was not only round, but that it revolved round the sun. The Camancho very indignantly replied, that any man of sense could, by looking off upon the prairies, see at a glance that the earth was level; and, moreover, that his grandfather had been west to the end of it, where the sun passed down behind a vertical wall. The Delaware continued, in his simple but impressive manner, to describe to the Camanche the operations of the steam engine and other objects of interest that he had seen, all of which the Camanche regarded as an effort of a fertile imagination, expressly designed to deceive him; and the only reply he deigned to make was an occasional exclamation in his own language, the interpretation of which the other pronounced to be, "Hush, you fool!"

I then endeavored to explain to the Delaware the operations of the magnetic telegraph; and, in illustrating its practical utility, said that a message could be transmitted a thousand miles, and an answer returned in the short period of ten minutes. He seemed much interested in this, and listened attentively to my remarks, but made no comments until I requested him to explain it to the Camanche, when he smilingly said, "I don't think I'll tell him that Captain, for the truth is, I don't believe it myself!"

MANKIND are more what they are made by their fellows, than what they are made by nature. The wolf is ferocious, because hunted from a whelp; the snake turns upon you, because you disturb and pursue it: the child grows surly, because unjustly coerced; but, above all, man becomes unjust and cruel, because pursued with cruelty and injustice by his brother man.

## DONT BE LENGTHY.

1. IN your calls of courtesy on business men and ministers of the gospel.

2. Especially regard this caution in the office of an editor. Editors have work to do, and they hate most emphatically to have men call to read their exchanges and lay around and talk about nothing.

3. Regard it also in that interesting story you are fond of telling. Amplification dilutes, and the dish is injured because the cook is long over it.

4. Don't make that editorial article too long. To many, a column is frightful, even of your good thoughts. That good deal which you wish to say will be more acceptable in short articles, and perhaps with different titles.

5. Look out, too, about that long sermon. Can't you squeeze out some of the superfluities, and by condensation give much matter in a smaller compass? "No, I don't think such a sermon as mine can be so used."—Well, then, add more precious thoughts, and make two of it. Your own good opinion of it will be elongated by such a process.

6. Don't be long about paying that debt. Make the creditor's eyes glisten by your promptness. Perhaps he has showered some inverted blessings upon you already for your delay. Prevent another drop.

7. Don't be so long in getting to the house of God. Better wait there than be waited for. People who are lengthy in the matter of their progress to the sanctuary are in danger of provoking *short words* about them, by those who are disturbed by their sluggishness.

8. Do not be long about any thing requiring promptness and despatch. Come boldly and decidedly up to every requisition of duty. The lingerer and loiterer accomplishes but little, painfully dragging out a comparatively useless life.—*Puritan Rec.*

## YOU CANNOT TELL.

No; you cannot tell what shall come of seemingly trifling matters which exist, or circumstances that happen around you.—Don't be in a hurry to snap your fingers in derision at every new thing that solicits your attention. There are indeed some bugs that only hum: but there are some that give the splendid scarlet to the robes of princes. Here is a fellow with some mechanical invention. He would like to have you look at it. It is to do something, perhaps a very simple thing, catch a mouse or kill a fly better than it was done before. Don't be off with a scoff. Bend a little and listen to him. There may be the germ of greatness there. When the air balloon was first discovered, some one flippantly asked Dr. Franklin what he thought of it. The Doctor answered the question by asking another:—"What is the use of a new-born infant?" Trifles may have great relations. The simple tea-kettle and the mighty steam engine seem far asunder; but the bubbling of the one was the progeniator of the other. A lad at school got the birch well laid on, for his experiments on a cat; but the young operator was on the track of the noblest of discoveries. The lad was Harvey, who first made known the circulation of the blood.—Newton was attracted by the falling of an apple. It set him to thinking. You could not have told what would come of so simple a fact. But you can now. That apple—and the disclosure to us of the sublime machinery of heaven, how related! No, you cannot tell what will come of the little matters about you. Better not despise the day of small things. Our noses were made for a better purpose than to be turned up so often and so scornfully.—*Traveller.*

## THE FIRE-WORSHIPPERS.

BAYARD TAYLOR writes thus from Bombay, India, Jan. 1, in regard to certain of the peculiar habits of the Parsees, or Fire-worshippers of India:

"They are, as is well known, followers of Zoroaster, recognizing one good and one evil principle, who contend for the mastery of the universe. They worship the sun, as the representative of God, fire in all its forms, and the sea. Their temples contain no images, but only the sacred fire; and though they have fixed days for the performance of various rites, they repeat their prayers every morning, soon after sunrise. The dead are neither buried nor burned, but exposed to the air, within a walled inclosure, on the summit of a hill. The bodies of the rich are protected by a wire screen till wasted away, but those of the poor are soon devoured by birds of prey. The children are generally married at from two to five years of age, and brought up together, till of a proper age to assume the duties of married life. Most of the marriages are celebrated at this time of the year, and the streets continually resound with the music of the bridal procession.

## VIOLENCE AND TRUTH.

IT is a strange and tedious war, when violence attempts to vanquish truth. All the efforts of violence cannot weaken truth, and only serve to give it fresh vigor. All the lights of truth cannot arrest violence, and only serve to exasperate it. When force meets force, the weaker must succumb to the stronger; when argument is opposed to argument, the solid and the convincing triumphs over the empty and false; but violence and verity can make no impression on each other. Let none suppose, however, that the two are, therefore, equal to each other; for there is this vast difference between them, that violence has only a certain course to run, limited by the appointment of Heaven, which overrules its effects to the glory of the truth which it assails; whereas verity endures forever, and eventually triumphs over its enemies, being eternal and almighty as God himself.—*Pascal.*

# For the Ladies.

For the Rural New-Yorker.

## ALICE.

CHARMING little dark-eyed Alice,
Skipping like a fay,
In and out across my vision
Fifty times a day.
With her heart so full of gladness,
And her eyes so full of glee,
She is part of all the sunshine
God has given to me.

Yester eve, it seems no longer,
Yet 'twas years ago,
When the elm tree shadows lengthen'd
In the vale below—
By the fountain in the hollow
Chanting drowsily,
I sat reading from a volume
Open on my knee.

And the quaint rhymes of the poet
Had a faint low chime,
Like the tinkle of the rain-drops
In the summer time:
And my eyes grew dim and dreamy,
With a wordless peace,
Sitting by myself and reading—
Underneath the trees.

Then the rustle of a footstep,
And a warbling voice,
Low and soft, but full of gladness
Made my heart rejoice:
And I turned my head to see her—
The birds forgot to sing—
Little Alice, darling Alice,
Coming to the spring.

With her pitcher on her shoulder,
And her locks of gold,
Seem'd she like a fairy maiden
In the tales of old.
I remember, I remember,
How the young moon shone,
Faintly on the dancing waters,
Ere we wander'd home.

And our hearts beat to each other,
Though much we did not say;
And I don't know why we homeward
Went the longest way.
But I carried Alice's pitcher,
And I quite forgot my book,
And it lies there still, I fear me,
In the hollow by the brook.

## OUR HOMES.

MANY and varied are the associations connected with a retrospect of Home. Whatever the distance, or however painful the reflection, memory lingers around one loved, one consecrated spot, the home of our childhood.

The family mansion is there, the venerable oak under which we sported in childhood, still waves its branches in the summer breeze, but the loved ones that made us so joyous and happy, are gone, *all gone;* they sleep in the village church-yard; and while we have knelt by their graves and moistened the green turf with the tear of affection, we have mourned the brevity of childhood's joys.

The endearing ties of wife and mother, have bound us to another hallowed spot, and we call it home. Loving hearts are there which mourn our absence, and welcome our return. And has our barrier of affection been sufficient to exclude the destroyer? Alas! the vacated seats of our loved ones, tell us he has invaded *this home*, and made it desolate and sad.

As the ties that bind us to this once happy spot are being severed, is there not a home which can never be desolated by the hand of the destroyer? We are anticipating one; but not on earth—*this* home is in Heaven. It is there we anticipate a reunion with our kindred and loved ones—it is there we hope to occupy a mansion which our Heavenly Father has prepared for all that love Him—where sickness, and sorrow, pain and death, will never be admitted.

A FARMER'S WIFE.

Victor, N. Y., April, 1853.

## UNEXPRESSED THOUGHTS.

TAKING up a poem, a few days since, I noticed that in the note prefixed to it, the author called it a translation. The thought struck me that all our words are but translations—whether we speak, or write, we are but interpreting the otherwise hidden language of our hearts. It is sometimes a difficult process, and we often fail to convey to others what we wish, through the imperfect medium of words. As we can but appreciate the works of an author when we read them in their original language, so much more lovely would our thoughts appear, could they be seen in all their primeval beauty, as "printed on the retina of the soul." Their loveliness is marred by the attempt to translate them, yet they afford to ourselves a high source of enjoyment. For there are thoughts, lovely, sublime thoughts, that fill our souls with rapture which no language, however beautiful it may be, can portray.

Who can translate the delightful thoughts and emotions that crowd upon us when first we behold ocean's vast expanse, and gaze on its snow-wreathed waves, dancing and sparkling in the brilliant sun-light, or lashed into fury by the quarrelsome wind? Or, when, amid all the wild sublimity of a thunder storm, we watch the vivid lightning flash beneath the darkened brow of Heaven? Or, yet, at dawn, when Morn with his rosy fingers throws aside the veil that Night has drawn o'er Nature's face, and the glorious sun bursts forth in cloudless splendor—his coming heralded by songs of sweetest melody from the wood-land choirs? And when the soul is left to hold communion with itself and God, and visions of transporting beauty burst upon the enraptured sight, when angels seem hovering near on wings of light; their faces radiant with eternal youth—blazing with celestial glory? In that blest world where blinding sin can cast no shadow, we shall understand and be understood—then the rays of thought which burn within our souls will be transmitted through a perfect medium, and no ray dispersed or lost. There the spirit, now chained and fluttering here below, like some caged bird, will soar away onward and upward, from height to height, and from glory to glory, "until even Gabriel himself shall look dim in the distance." ——.

Clifton Springs, N. Y., 1853.

## THE ART OF ARRANGING THE HAIR.

How often do we see a really good face made quite ugly by a total inattention to lines. Sometimes the hair is pushed into the cheeks, and squared at the forehead, so as to give a most extraordinary pinched shape to the face. Let the oval, where it exists, be always preserved; where it does not, let the hair be so humored that the deficiency shall not be perceived. Nothing is more common than to see a face which is somewhat too large below, made to look grossly large and course by contracting the hair on the forehead and cheeks, and there bringing it to an abrupt check; whereas, such a face should enlarge the forehead and the cheek, and let the hair fall partly over, so as to shade and soften off the lower exuberance. A good treatise, with examples in out-line of the defects, would be of some value upon a lady's toilet, who would wish to preserve her great privilege—the supremacy of beauty. Some press the hair down close to the face, which is to lose the very characteristic of hair—ease and freedom. Let her locks, said Anacreon, lie as they like; the Greek gives them life and a will. Some ladies wear the hair like blinkers; you always suspect they will shy if you approach them. A lady's head-dress, whether in a portrait or for her daily wear, should, as in old portraits by Rembrandt and Titian, go off into shade, not to be seen too clearly, and heard all around; should not, in fact, be isolated, as if out of sympathy with all surrounding nature. The wigs of men of Charles the Second's time had at least that one merit of floating in the background, and in their full softening the sharpness of the lines of the dress about them.

## COURTESY TO LADIES.

WE like the views which a contemporary expresses. We go as far as any one in that courtesy which characterizes Americans, but we also go in for the abolition of revolutionary customs in our churches.

Every sensible man and woman should set their faces like a flint against the custom which compels the men to march out of a crowded pew to give the ladies the inner seat. It is well enough for one gentleman to keep the outer seat, to proffer any vacant seat there may be in his pew to strangers or visitors; but, with this exception, the custom of a general stampedo on the approach of a lady would, in our opinion, be "more honored in the breach than in the observance." The Rondout Courier says:—"It is particularly an American custom, founded in the earlier settled States. In those States, in their time, the male settler carried his arms to church, ready to turn out in case of an attack by Indians, and he of course occupied the first seat of the bench or pew. Times have changed; we have no Indian apprehensions, and women will go to church. So let us alter the view of courtesy or necessity."

## SWEET THOUGHT.

WHENEVER we find our temper ruffled toward a parent, a wife, a sister or a brother, we should pause and think, that in a few months or years they will be in the spirit land, watching over us, or perchance we shall be there watching over them left behind. The intercourse of life between dear ones should be like that between guardien angels. As charming Hunt sings:

How sweet it were, if without feeble fright,
Or dying of the dreadful beauteous sight,
An angel came to us, and we could bear
To see him issue from the silent air
At evening in our room, and bend on ours
His eyes divine, and bring us from his bowers,
News of our dear friends, and children who have never
Been dead indeed—as we shall know forever.
Alas! we think not what we daily see
About our hearths—angels that *are* to be,
Or may be if they will, and we prepare
Their souls and ours to meet in happy air—
A child, a friend, a wife whose soft heart sings
In unison with ours, breeding its future wings.

THE Home Journal says:—"The remedy for woman's dependent condition is much in her own hands. When mothers, no matter what their circumstances, insist upon their daughters acquiring some art or trade, by which an independent existence can be secured; when they avoid as nuisances fashionable young ladies' seminaries; when we all learn to confront and tweak by the nose the silly bugbear of public opinion—then woman's 'emancipation' will not long be delayed. New careers will open for female industry, quite as fast as the qualities necessary for their successful pursuit are developed."

MOORE'S RURAL NEW-YORKER.

ROCHESTER, JUNE 4, 1853.

PUBLISHER'S NOTICES.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW-YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ ADVERTISEMENTS must be brief, appropriate to the objects of the paper, and accompanied with the cash.

ADDITIONS TO CLUBS—Are still in order. Having but few back numbers, agents and others can order additions to Clubs at $1 per copy from 1st of March or April to end of the year and volume. New Clubs, or single subscribers, can begin 1st March, April, or May, as preferred.

## New Railroads in Operation.

THERE are quite a number of roads in this "great and growing country" which might be named under this heading, but we propose to begin at home, and keep within bounds.

The Rochester and Syracuse Direct Railroad—passing through Palmyra, Lyons, Clyde, &c.,—was opened for business on Monday of this week The road is 76 miles in length—28 less than the central route via. Geneva and Auburn. At present, there are only two trains each way, daily, but others will be added about the middle of the month. The road passes through a fine, productive and flourishing region, and will be of great convenience and benefit to the people on the route. It will bring several enterprising towns within one and two hours distance of Rochester—thus affording good facilities for trade and communication.

On Monday we were favored with calls from several Wayne county RURAL-ists, who came up on the "first train." Though rail-riding is considered somewhat dubious "about these days," we have such a desire to visit certain towns, and people, on this route, that we shall endeavor to do so the first opportunity. We wish to see more of sundry towns which are numerously represented on our books,—but those same books, and other matters, oblige us to remain at anchor almost constantly. But we *were* talking of railroads. Well, we trust it may never be our duty to record any collision, or other calamity, as occurring on a road which brings such a host of friends almost within speaking distance.

The Canandaigua and Niagara Falls Railroad—passing through Mendon, Rush, Caledonia, Le Roy, Stafford, Batavia, &c.,—has been completed, and is in operation, as far west as Batavia. The remainder of the road is in a good state of forwardness, and will probably be completed as early as the 1st of July.

The Rochester and Charlotte Railroad—connecting our city with Lake Ontario at the mouth of the Genesee, (one of the best harbors on the Lake,)—has recently been completed, and some trains have passed over the road. We believe regular trains are to commence running about the middle of this month. Its length is 8 miles.—Aside from the advantages of this road to business men, travelers, &c., as a connecting link with the lake steamers, it will afford our city-sick and care-worn citizens, a convenient and cheap "medium" of inhaling pure air and obtaining pleasant recreation on the shore or surface of old Ontario. And thus may it prove a blessing.

## The Season and the Crops.

THE rainy weather still continues, and we learn, has very generally prevailed throughout the northern portion of the United States. This has been rather favorable to the grass and wheat crops, and the backwardness of the season has been no injury to the fruit crop generally. For spring crops, corn, oats, &c, the prospect has been quite discouraging, many farmers having, as yet, done little planting. Should June and July be favorable, good crops may still be realized.

We copy a few notices of the crops from different sections of the country:

Farmers throughout this region, have been engaged for the few past fair days, in corn planting. The season for the putting in of this crop, owing to the repeated rains, is very late, though with favorable weather onward, a good crop may yet be realized.—*Mt. Morris Union*, May 25.

Thus far the season is very backward and unpromising for spring crops, and unless a favorable change takes place early, they will necessarily be very light.—*Le Roy Democrat*, May 28.

The meadows and pastures in Western New York are well covered with luxurant grass, or clover, although not so forward as we have seen them at this season of the year. Grazing in summer and plenty of hay in winter, are matters of great importance in New York husbandry; and the prospects in both are all that the public can reasonably ask.—*Rochester American*, May 30.

The season thus far has been favorable. Winter grain in this quarter promises a heavy yield. Grass is growing luxmantly, and the seed for spring crops has had nothing to do but sprout and shoot forward under the influence of sun and frequent rains.—*Poughkeepsie American*, May 26.

The spring has been very wet in the vicinity of this city, and the farmers are generally behind with their work, but the crops promise well.—Grass was never better at this season, and we consider a good yield of hay already assured. Wheat (little sown) is quite thrifty; corn comes up rank and thrifty, and potatoes (extensively planted) also promise well. The woods and meadows never looked more inviting.—*N. Y. Tribune*, May 30.

The wheat crop has looked remarkably promising until within the last two weeks, within which period it has been seriously injured in this region by the Hessian fly. Our farmers complain greatly of the ravages this insect is making all around us. We learn that the ravages of the fly are the greatest on the lightest soils.—*Harrisburgh, (Pa.,) Tel.*, May 25.

The wheat fields in this county are in a most promising condition, presenting every appearance of large crops. The rainy weather retarded the operations of the farmer somewhat in planting corn, but they have nearly all finished. The fruit is quite promising, and bids fair to be abundant.—*Hagerstown (Md.) People's Own*, May 21.

The wheat crop in Tennessee is said to be very fine and promising. In this section wheat never looked better, and with no untoward accident to it, the crop will be a large one.—*Huntsville (Ala.) Advocate*, May 18.

The season is remarkably forward in this section. The trees are looking finely, and every sign now denotes an excellent season for agricultural operations.—*Portland Argus*, May 26.

The Easton (Md.) Gazette states that the "fly" has attacked the wheat in that county, and on lands that have not been improved by guano, has done much injury. The wheat on guanoed land was too far advanced when the "fly" made its appearance, to be much injured.

In the Southern States an extensive drought has prevailed, threatening considerable injury to the cotton crop.

## Literary Notices.

AMERICAN GAME IN ITS SEASON. By HENRY WILLIAM HERBERT. Illustrated from Nature, and on wood, by the Author. New York: Charles Scribner, 1853.

THIS handsome volume is for the most part composed of papers which have appeared within the last few years in GRAHAM'S Magazine, under the running title of "The Game of the Month," and comprises sketches with pen and pencil, of some of the most highly esteemed varieties. It is written in an attractive style for the general reader, and will be found of especial interest to the devotees of field sports—hunting, gunning and fishing. The publisher deserves the thanks of this class of readers for the collection, in so neat a book, of the matter before us. Sold at DARROW'S, Main St. Book Store.

THE WESTERN LITERARY MESSENGER for June, contains sixty-four pages of excellent reading, well printed on good paper. It is still edited by Mr. CLEMENT, and published as heretofore, at $1,50 per year. Buffalo: Jewett, Thomas & Co.

THE ILLUSTRATED MAGAZINE OF ART for June, concludes the first volume. It contains thirty-two fine engravings with interesting descriptions, among them a sketch of LANDSEER, the celebrated animal painter, with copies of some of his best pictures. New York: A. Montgomery. DEWEY, agent.

PUTNAM'S MONTHLY for June, also closes the first volume of that readable Magazine. At DEWEY'S.

## N. Y. Legislature.

### Extra Session.--Synopsis of Proceedings.

TUESDAY, May 24.—*Senate.*—The Extra Session convened to-day, and proceedings were commenced as usual by the reading of the journal of the last day's Session. Notices of the introduction of several bills were given, and some were passed. A resolution to adjourn on the 9th of June, was spoken of.

*Assembly.*—Notices of bills and resolutions occupied the Assembly.

WEDNESDAY, May 25.—*Senate.*—Several bills were noticed, and others passed, as also was a resolution to adjourn on the 7th of June. The Canal Appropriation bills were ordered to be printed, and some discussion ensued on the Governor's action thereon.

*Assembly.*—The Plank Road bill was debated, and a resolution to appoint a Committee to investigate and report measures against such frequent Railroad accidents was adopted.

THURSDAY, May 26.—*Senate.*—A discussion was held on the repeal of the recent Emigrant passenger law, and a law to incorporate Sixpenny Savings Banks passed. Several reports were received, and the afternoon Session omitted to allow of the meeting of the Judiciary Committee.

*Assembly.*—The Canal Appropriation bill was returned by the Governor, with a request that it be amended. It was re-committed accordingly. Messrs. PETERS, HASTINGS, and others, discussed the Niagara Ship Canal project. It was lost—48 to 50.

FRIDAY, May 27.—*Senate.*—Among the bills passed was one to authorize the promotion of Agricultural Societies. [Provides for forming such Societies, with power to hold property by County Societies to the amount of $25,000, and Town Societies to the amount of $10,000.] The afternoon Session was devoted to Mr. LOOMIS' Taxation bill.

*Assembly.*—Mr. PETERS' Saving's Bank resolution was passed. The main topic of the day was the Report of the Committee on the Canal bill, which, with the Minority Report, was finally referred to the Standing Committee.

SATURDAY, May 28.—*Senate.*—A number of private and local bills were passed, and some debate occurred on allowing Stockholders in Railroads to hold mortgages on the same.

*Assembly.*—The principal topic was again the Canal question. A motion was made to re-commit the whole subject to the Canal Committee, with instructions to report the Vanderbilt plan, as perfected by the minority of the Committee; it was moved to lay this upon the table, and the yeas and nays called for, resulting in laying it upon the table, by a vote of 66 to 44.

MONDAY, May 30.—*Senate.*—Reports, notices, and resolutions occupied the Senate,—mostly of a local character.

*Assembly.*—To-day the Canal business was the special order, and Messrs. BURNET, HASTINGS, and HADLEY spoke on the question, the latter not concluding his remarks before recess.

## Correspondence.

### Eastern Correspondence.

*The Extra-Session of our State Legislature—New York city—Visit to Long Island—What the Crystal Palace may be.*

ALBANY, May, 1853.

EDS. RURAL:—The Legislature commenced again its extra session on the 24th ult. The meeting of the members was cordial and friendly, and it was pleasant to see them exchanging good wishes and kindly inquiries. They are all looking hearty, as if contact with the free air of the country had been beneficial. Of the duration of the session none can guess, but it is to be hoped, that all the important business will be carefully and faithfully dispatched, be the time long or short. Nothing is ever gained by hasty legislation, but very much lost.

Before coming to this city I spent a few days in New York and its environs. And I was astonished at the rapid increase of population in and about the city. It will be but a little time before all the surrounding country, for the distance of 20 miles from the City Hall, will be all city. It is destined to become the largest city of modern times in the world.

A portion of two days was spent on Long Island, going some twenty-five miles up. No region in the State can equal it for pleasant residences and profitable farming. The air was delightful, and must always be salubrious, coming as it does, mostly from the Ocean or Sound. The soil is light, but everywhere well repays careful cultivation. Manure is everywhere used, and as carefully husbanded as any of the products of the farm. Guano, leached ashes, and the street manure of the city is used on almost every farm.—It's a great pity that some plan cannot be devised to save the sewerage of all the large cities, so that it could be applied upon the surrounding land.—That of New York alone, would add more than a million of dollars a year to the capital of the county, by enabling the farmers and gardeners to produce that much more upon the same amount of land they now cultivate. The State Agricultural Society ought to take the matter in hand.

The Crystal Palace *may* realize the expectations of the country. It *may* do credit to our State and the Nation. It *may* be done by the first of July, and it *will* probably put a good amount of money into the pockets of the men who have gotten it up Time will show. RUSTIC.

### Letter from Illinois.

CHICAGO, Ill., May 24, 1853.

FRIEND MOORE:—I reached Chicago, the commercial city of the Northwest, last week—Wednesday, and immediately proceeded west to Galena on the Mississippi. The present is an unfavorable season for traveling on account of the rains falling for the past three weeks, almost submerging the greater portion of the Prairie land. On the line of the Galena and Chicago Union Railroad there is much land which is very low, and poorly adapted for agricultural purposes—except for grazing—for many miles, or until you reach the Fox River. From thence you come to a rolling prairie, which is better for crops. Thro' this section, I saw a good many fields of Oats and spring Wheat, which looked well, considering the present cool, wet and backward season. I saw no pieces of corn planted, but some were planting, and nothing but the rainy weather prevented. Winter Wheat is not raised to any great extent in this section of the State.

A great objection to this section of Illinois is the scarcity of woodland. The timber grows principally along the streams and rivers, and these are the only localities where dense forest timber is seen. Besides these strips of timber, there are occasional groves, principally made up of dwarf oaks. The soil here is different from that of the prairie; being a sandy or loomy gravel, and higher than the general surface of the prairie.—Another species of timbered land, is termed the barrens, upon which no full grown timber grows. It is occupied with bushy shrubs—principally oak, which grow only about from five to ten feet high.

Then again the traveler will pass out upon the open prairie where he can gaze for many miles, and in some parts as far as the eye can extend without beholding a tree; the surface of the ground presenting one broad expanse of earth, spotted only with an occasional herd of cattle, which luxuriate in the tall grass, and among the wild flowers. I spent no time, except to view the country, &c.

I stopped over night at Rockford, ninety-five miles from Chicago. This is a *city* of 5000 inhabitants, located on the Rock river. This is a very pretty section of country, indeed; timber and water being quite plenty. Here too, farming business is more extensively carried on than in other portions which I passed through.

Belvidere is also a pleasantly located village of some 2,000 inhabitants, lying on the north branch of the Kishawauka river. A good agricultural country with many advantages and offering very great inducements to those who wish to settle in the West, exists in this section, both for the industrious farmer and the capitalist. After returning to Chicago, I turned toward the south-western part of the State. Reaching the town of Joliet, of about 5,000 inhabitants—the county town of Will county,—I left the cars and proceeded to Lockport, a smart, pleasantly situated little town of about 1,600 inhabitants, where I spent the Sabbath with a friend, who has resided in this place for the past sixteen years. This is the finest section of country I have seen yet in this State. The canal from Chicago to Lasalle, is one hundred miles in length, and extends to the Illinois river, at a point which is navigable to St. Louis. Along this canal, which follows the flats of a little stream, is timber in larger quantities than in other portions which I have visited. Gentle bluffs extend from each side of the river, beyond which is a beautiful rolling prairie, richly adapted for all agricultural purposes. On the east bluff, and extending back for some few miles is a splendid region of country, mostly located by a large settlement of English,—which is called the English settlement.

As I took the cars at Chicago for Peru, I met Dr. JNO. A. KENNICOTT, the Horticultural Editor of the Prairie Farmer, who was going to Springfield, to attend the first meeting of the Executive Committee of the State Agricultural Society, organized and chartered at the last session of the Illinois Legislature—with an appropriation of one thousand dollars per year, for two years, for Premiums, expenses, &c. Dr. K. said the reason they had not organized a State Society before, was because they had no mode to get from place to place; but now they were ready, railroads were extending through all parts of the State.—By the way, Dr. K. wished to be remembered to friend MOORE. He also spoke very favorably of the RURAL NEW-YORKER, and thinks it the best of Agricultural journals.

After a day's stay at Lockport, I proceeded to Peru, some hundred miles down the Illinois river, The scenery of this route by railroad is almost equal to that of the Hudson river road. High and overhanging bluffs of rocks all along the river are beheld, fraught with romantic beauty and many fine strips of timber skirt each side.—The land upon these bluffs extending back is fine, and very fertile, and beautifully located for farming purposes. You may hear from me again in Indiana. Respectfully,

C. W. HOBART.

### Notes from the Capital.

ALBANY, May 30, 1853.

EDS. RURAL:—The papers contain the announcement that "the long agony is over," and that a Postmaster for Albany has been appointed. Whether this is so or not, the long *rain* is over, and we have as beautiful weather as heart could wish.

The Legislature commenced its Extra Session on the 24th ult. The members coming fresh from their constituents, seem determined to make the Session short and profitable. The Canal Committee, in the Assembly, have reported resolutions for amending the Constitution, so as to allow the Legislature to loan one million and five hundred thousand dollars *per annum* for six years, and a million and a half to pay the amount due for money received into the Treasury under the law of 1851. The resolutions provide for the payment of the money so loaned without a resort to *taxation*. They also declare that the tolls on the Canals shall not be farther reduced by the Canal Board, unless the Legislature concur in such reduction.

The minority of the Committee offer as an amendment, the resolution passed by the Senate, known as the "Vanderbilt Plan," which it is claimed will secure the completion of the Canals in *four* years. These propositions, which differ mainly as to time, are before the Committee of the Whole, and will be acted on in a few days. The probability is that the majority resolutions will prevail in the Assembly, and a Committee of conference be appointed, with the hope of bringing the two Houses to an agreement.

The Session will be one of much interest to politicians, not only on account of the importance of the Canal question, but because the fall election will depend very much on the measures adopted. It is undoubtedly true (although it is a matter of regret) that the course taken by members of different parties, is dictated more by a desire to make *political* capital than by a fixed purpose to complete the Canals in the best manner, and in the shortest time possible. When the *agents* of the people (the Legislature) shall be taught to serve the true interests of the people,—when the money and the welfare of the State shall be guarded with the same care that individuals require of one another,—then may we hope to see *honest* politicians, *pure-minded* and *patriotic* statesmen, *tried* and *true* almoners of the public will,—objects rarely known at this day, even by "the oldest inhabitant." *OWE.*

CANAL BREAK AT ADAM'S BASIN.—On Sunday Morning last a serious break occurred in the Erie Canal, 15 miles west of this city. The stone culvert situated about 40 rods west of the bridge at Adams Basin gave way, and in five minutes after the first indications of a break were discovered, the bottom of the canal was washed out for some little distance; and so great was the motion of the water, three boats were drawn into the breach, and a number more in the vicinity narrowly escaped a like disaster. The culvert is pretty much destroyed and must be rebuilt from the bottom.—A large breach in either bank of the canal will require several thousand yards of earth to repair. It will take nearly a week, it is thought, to repair it.

LEGISLATIVE EXCURSION.—The Directors of the New York Central Railroad will make an excursion from Albany to Niagara Falls, leaving Albany this (Saturday) morning at 6 o'clock, dining at Niagara Falls, staying over Sunday and returning on Monday. The Legislature are invited, and the Press will be fully represented.

☞ The Trustees named in the Legislative act incorporating the People's College, held their first meeting at Owego, Tioga county, on Wednesday, and elected D. C. McCallum, of Owego, President; J. Wynkoop, of Chemung, Vice President; Tracy Morgan, of Binghamton, (Cashier of the Broome County Bank,) Treasurer; Harrison Howard, of Lockport, Secretary and General Agent.

—— New potatoes and green currants have appeared in the Cincinnati market.

## News Brebities.

—— Nearly 200 acres of woodland were burnt over at Marshfield last week.

—— On Sunday the 15th eleven sheep were killed by lightning on East Hill, near Dansville.

—— The Cincinnati Atlas says the State tax in that county is increased this year from 35 to 51 cents.

—— There are in Philadelphia city and county 6 public, 15 charity and 17 private schools for colored children.

—— Oranges weighing 14 ounces have been sent from Bermuda to the New York Crystal Palace Exhibition.

—— The mock auction shops are in full blast in New York, notwithstanding the new law for their suppression.

Dr. Kane is nearly ready for sea with his brigantine "Advance," on another voyage in search of Sir John Franklin.

—— The City Council of New Bedford has appropriated $2,000 for the celebration of the ensuing Fourth of July.

—— Adams & Co.'s California Express will hereafter leave Boston on the 4th, 13th, 19th, and 26th day of each month.

—— Ex-President Tyler is said to be suffering from dyspepsia, symptoms of consumption, and will not probably long survive.

—— The Utica Herald mentions that one farmer in the town of Norwich, Chenango Co., supports, a dairy of three hundred cows.

—— The late Nathan Dunn, of Philadelphia, left a donation of $14,000 to the Widows' and Single Womens' Asylumn in that city.

—— The American Association for the advancement of Science will hold its annual meeting at Cleveland, Ohio, on the 28th day of July.

—— Mr. Battin, an experienced engineer, has been engaged to make the necessary surveys for the contemplated Water Works in this city.

—— The British are concentrating a naval force near Halifax, for the protection of the fisheries against the encroachments of American craft.

—— The Charleston Mercury calls the Sandwich Islands the Hotel of the North Pacific Ocean. We hope it will soon have an American landlord.

—— Nearly or quite five hundred lives have been lost within the last month by sudden casualties, in the United States, or U. S. vessels at sea.

—— The jury in the interminable Gardener case, at Washington, returned an answer to the Court, saying there was no probability of their agreeing.

—— There are 1,285 miles of railroad completed in Ohio, and 1,719 more in process of construction. The number in process of contemplaton is indefinite.

—— A contract has been made in England for the construction of a mammoth steamer of upward of six hundred feet in length, and measuring 12,000 tons.

—— One hundred new buildings are in process of erection, in the village of Owego and the Advertiser says as many more would immediately find occupants.

—— We learn from the Utica Gazette that Mr. T. K. Fisher is constructing in that city, a carriage to be propelled by steam, intended for use on common roads.

—— Our friend, the sea serpent, showed himself a week or two since in the Brazos river, Texas. He was doubtless starting on his summer tour to the north.

—— We learn from the Utica Gazette that Mr. T. K. Fisher is constructing in that city, a carriage to be propelled by steam, intended for use on common roads.

—— Gen. James Taylor, of Newport, Ky., left a very long will, which has to be recorded in 26 counties in Ohio. It manumits 20 slaves and bequeaths $4,000,000.

—— Abraham Wagener, Esq., died in Penn Yan, on Saturday, aged 78. His father was one of those who came with Jemima Wilkinson from Pennsylvania in 1791.

—— No icebergs have this season been seen on the Atlantic by packet ships. It is considered as an evidence that the winter in the Arctic regions has been very severe and protracted.

—— The town board of excise of Saratoga have licensed thirty-two hotels and small taverns to sell spirituous liquors—which, for a "watering place," will do pretty well, we should say.

—— At a recent meeting at Syracuse of the Directors of the Buffalo and Rochester Railroad Company, an extra dividend of ten per cent was declared out of the surplus means of the company.

—— Gen. James Taylor, of Newport, Ky., left a very long will, which has to be recorded in twenty-six counties of Ohio. It manumits twenty slaves and bequeaths $4,000,000 of property.

—— A severe drought extends throughout the State of South Carolina, consequently they have no stands of cotton. Of one crop of 150 acres, there is not as much up as should be on one acre.

—— The Keokuk (Iowa) Despatch states that there has been an accession to its population in eight weeks, of about 2500 people. The suburbs are occupied by tents, in close order over a square mile.

—— The existing debt of North Carolina is $1,228,235. Additional loans of credit for various railroads have been authorized, so that the existing, and the authorized debt, will be $2,363,235.

—— An eminent German has taken the pains to count the hairs in heads of four different colors. In a blond one, he found 140,400; in a brown, 109,440; in a black, 102,962; and in a red one, 88,740.

—— The Buffalo Republic says, the Morse Line of Telegraph between New York and Buffalo, will after first of June be thrown into two circuits, one extending from Buffalo to Utica, the other from Utica to New York.

—— The value of the products of the Western forests, through the N. Y. and E. Canal, has increased from $2,813,526 in 1834 to $11,061,345 in 1852, and the total value for nineteen years has been $92,665,477.

—— It is proposed to remove the remains of Gen. Harrison, which are now entombed at North Bend, to the battle-field of Tippecanoe, there to slumber with those of the intrepid Col. Joe Davis and their compatriots.

—— A plowing and sheep-shearing match takes place at Geneseo on Saturday, June 14th. The shearing premiums are for the best three fleeces taken off in an hour and a half, competitors to furnish their own sheep.

—— A sale of some two hundred salt lots, in the Onondaga reservation, took place on Thursday at Syracuse. The sum realized for the whole was $34,836, and with a single exception the prices paid were above the appraisals.

# Foreign Intelligence.

## Arrival of the Arctic.

THE Steamship Arctic arrived at New York on the 29th ult., with English news of the 18th, and Paris dates of the 17th. Hon. Wm. P. R ves and family are among the passengers.

MARKETS.—*Breadstuffs*—No change. Business not active. Prices in favor of the buyer.

*Provision.*—McHenry's circular says: Bacon active, but buyers refuse to pay an advance.—Beef and Pork dull. Shoulders wanted at 34@35; Cheese wanted; Lard dearer; Tallow steady and quiet at 47; Clover seed firmer from proposed abolition of duty.

The Tribune gives the following synopsis:

The News brought by the Arctic is unusually varied and interesting. Mrs. Stowe and party have been present at a meeting of the British and Foreign Anti-Slavery Society. She was received with a tumult of applause, the vast audience rising to welcome her, and the same enthusiastic ceremony was repeated as she went out. Professor Stowe made a speech on the occasion, counseling his hearers to abstain from slavegrown products. The Arctic Searching Expedition, commanded by Lieut. Inglefield, was about to set sail for the Northern Seas of this Continent.

From France, we hear that the Empress was so far recovered as to appear in public, though still in delicate health.

The King of Belgium, with his son, was at Vienna, on the visit he has been making to the German Courts.

In Spain, there was a considerable excitement with reference to the reception of Mr. Soule as Envoy from the United States, and the more violent journals urged that he should be sent home.

At Naples, the arrival of the U. S. frigate Cumberland had caused a stir among the police, it being reported that Mazzini was on board, but on the commander's contradicting the rumor all cooled down again.

From Turkey, there is nothing new of moment.

There has been more fighting in Burmah, in which the English were victorious.

In China, the rebellion was rapidly advancing, so that the inhabitants of Shanghai were in a panic. The interposition of the British, French, and American forces has been begged by the Imperial Chinese authorities, and some men-of-war of each nation had gone from Hong-Kong northward, rather to protect subjects and citizens than to gratify the mandarins and uphold the tottering dynasty.

Commodore Perry was at Galle, Ceylon, on the 11th of March, on his way to Hong-Kong.

From Australia, the gold news maintains its richness; one nugget has been found weighing above 134 lbs. of pure gold, and worth about $28,000.

The Kaffir war is finally settled once more, for how long a time remains to be seen.

## Counterfeits for the Month.

10s on the Thames Bank, Conn., altered from 1s—gennine plate.

5s on the Central Bank, N. Y. City, altered from one's.

10s on the City Bank, New Haven, Ct.—10 on upper corners—letter X on lower corners—female head between the signatures.

5s on the Commercial Bank, Burlington, Vt.—vig. steamship, &c.—female on the left end—eagle between the signatures—not like genuine.

2s on the Ontario Bank, Utica, N. Y., altered from one's—vig. a man, rake, plow, &c., on the upper part of the left end—head of a female on the lower left end.

5s on the Rhode Island Central Bank, R. I.—Counterfeit—vig. a female—ship on the left end—a reaper on the right one—not like genuine.

1s on the Mechanics' Bank, New Haven, Conn.—vig. female and vase of flowers on the left end—steamboat on the right—very good engraving.

5s, 10s, 20s and 50s on the Bank of Newark, Wayne Co., N. Y., altered from 1s—vig. steamship, ship, &c.—cattle, &c., on the right end—female bathing between the signatures.

5s on the Western Bank, Mass.—vig. cattle—female and dog on the right end—sheaf of wheat and plow on the left end—not like genuine.

10s on the Waterbury Bank, Conn.—vig. two females—Washington on the right end—not like gennine.

10s on the Shoe and Leather Bank, N. Y. City, altered from genuine two's—vig. horseman and cattle on left end—well done.

2s on the Mechanics' Bank, Watertown, N. Y.,—a ship under full sail—female figure on the right end—Comptroller's die on the left end—unlike the genuine.

AMERICAN SUNDAY SCHOOL UNION.—The twenty-ninth anniversary of this Institution was celebrated in Philadelphia on Tuesday evening. Its receipts during the past year amounted to $217,014, which, with the exception of $145, was all expended. The liabilities of the Institution now amount to $65,424, but the stock on hand is valued at $103,241. It has 157 missionaries, who have established 1,704 new schools, and visited and revived 2,398 others; total scholars 195,350; teachers 29,997. During the year, $130,910 worth of publications were put into circulation.

FALL OF CATFISH.—The Norfolk Argus states that a curious phenomenon attended the hail storm in that city on Tuesday night. Quantities of catfish, some measuring a *foot in length*, fell in different sections of the city, and some of the fields were literally strewed with them. Hundreds were picked up in the morning. This, says the Argus, is no piscatorial fabrication, but a fact which is attested by hundreds of citizens.

BUTTER AND CHEESE.—New York is far in advance of any other State in the productiveness of its dairies. They yield one-fourth of all the butter, and nearly one-half the cheese produced in the Union. Pennsylvania, which makes 40,000,000 pounds of butter, is less prolific in cheese than many smaller States. In this latter article, Ohio is before all other competitors, except New York.

MONROE COUNTY FAIRS.—The Executive Committee, will hold a session at the Court House, on Tuesday, June 7th, 1853, at 2 o'clock, P. M., to make a premium list, and decide when and where Fairs are to be held. It is desired that the Committee from each town, and as many members as possible shall be present. The Executive Committee of the Horticultural Society is also invited to meet with us at that time. Returns should be made early in the day from those who have been procuring memberships. H. C. WHITE, *Sec'y.*

# Market Intelligence.

RURAL NEW-YORKER OFFICE,
Rochester, June 1, 1853

THE wet weather for the week just passed, has acted unfavorably upon business of all kinds, and but a small amount of country produce has been brought forward.

FLOUR—There is a moderate inquiry for small lots, with a better feeling looking to an advance.

GRAIN—There has been quite an active demand for wheat at $1 17@1,18, though at the close buyers were less anxious. Holders continue firm. No decline in price.—Oats are still wanted at 36@36, a very high figure. In other grains no change, and very little doing.

PROVISIONS—We have little change to note. Sales are limited to small parcels for immediate use. Eggs are abundant at 10c. Butter 12@14. Potatoes 25@37½. Apples $2 per barrel.

HAY—The amount in market is limited, with a moderate demand, at $10@14.

BEEF CATTLE—Butchers have difficulty in obtaining supplies of choice cattle, and prices rule high.

VEAL CALVES are abundant at $3,50@5.

LAMBS—High prices are paid for nice lambs, ranging from $1,50 to 2,50 each.

WOOL—As the time draws near for the new clip, the interest of producers and purchasers is no way diminished, and we observe nothing to induce the belief that there will be any depression of prices.

No material alteration has occurred in other marketable commodities.

### Rochester Wholesale Prices.

| | | | |
|---|---|---|---|
| Flour, bbl | $4,75@5,25 | Butter, lb | 12@14c |

| Lamb skins | 50@75 | Flour barrels | 36@37 |

## NEW YORK MARKET.

NEW YORK, May 30.

FLOUR—The market is firm for the low grades of State and Western flour for the home and eastern trade, with little export inquiry. Canadian steady. Sales Western Canal 1,000 bbls, $4,56@62 for common to straight State; $4,68@87 for common to good Ohio, and mixed to fancy Michigan and Indiana.

GRAIN—The supply of prime white wheat is very limited, and is much wanted to complete cargoes for export. Sales 1400 bu good Genesee on p. t. Barley not plenty.—Sales 1,000 bu fair Western, via New Orleans, 65c afloat. Oats dull and heavy. 46@48c for State and Western.—Corn is quite plenty, easier and is active. Sales 48,000 bu, 58@59½c for unsound; 60@61½c for Southern mixed; 62@62½c for Western mixed; 61@62c for Southern white; 64c for round yellow; 64@65c for Southern yellow.

PROVISIONS—Holders of pork are steady. Demand moderate—$15,50@56 for mess; $13 for prime; $17, clear. LARD very plenty and selling, 9¼@9¾c. BUTTER and CHEESE plenty and dull.

## ALBANY MARKET.

ALBANY, MAY 30.—The market opened with a fair enquiry for all kinds of Grain, but dull for Flour.

FLOUR, &c.—The demand for Flour is restricted, and the business light. In prices there is no change to notice. The sales at $4,50@4.62 for common to good State; $4,69@4.94 for Michigan, Ohio and Indiana; $5,06@5,44 for fancy State and extra Western; $5.50@6 for extra Genesee.

GRAIN.—Little Wheat arriveing market better for white. Sales, Mediterranean at $1,14; good white Ohio at $1,19 and good Genesee in car lots at $1,30. Corn is firmer for home consumption and for shipment east. Sales at 62½c. for low mixed Western; 63@64c. for fair to good high mixed do. and 76c. for round Yellow. Unsound is selling at 56@60c. Barley is in good request at a slight decline.—Sales, good four-rowed Wisconsin, at 66c. Oats are rather firmer. Sales, State and Western at 47c.

FEED.—We have only to notice a sale of Middlings at $1. The market is dull.

## BUFFALO MARKET.

BUFFALO, MAY 30.—The break in the Canal at Adam's Basin has effectually checked operations. There is no produce offering, and no demand for frieght for the east.

## CAMBRIDGE CATTLE MARKET.

CAMBRIDGE, May 25.—At market, 524 Cattle, about 475 Beeves, and 49 Stores, consisting of Working Oxen, Cows and Calves, yearlings, 2 and 3 years old.

Prices—Market Beef—Extra, per cwt. $8 00, cwt.; 1st. quality, $7,50; 2d do, $7@7,25; 3d do, $6,75; ordinary $6,00@6,50.

Hides—$4,75@5 per cwt.
Tallow—$7@7.25 per cwt.
Pelts—$1@1,50.
Calf Skins 10c per lb.
Veal Calves—$2, 5@10; 403 at market.
Stores—Working Oxen—$82, 85, 91, 98@156.
Cows and Calves—$29, 31, 33, 37, 40@64.
Yearlings—$12, 13@14,00
Two years old—$29, 34@44.
Three years old—$44, 49, 52@57.
Sheep and Lambs--624 at market.
Extra, $6, 7@9.
By lot—$3, 3,50, 4@4,75.
Swine—Wholesale—still fat, at 5½c.; hard fat at 5¾c.; shoats, 6¾@7¾c per lb.

## BRIGHTON CATTLE MARKET.

BRIGHTON, May 26.—At market 420 Beef Cattle, 9 pairs Working Oxen, 62 Cows and Calves, 850 Sheep and Lambs, and 1,500 Swine.

Prices—Beef Cattle—Extra, $8; 1st quality $7,50; 2d do, $7@7,25; 3d do. $6,75; ordinary $6@6,25.
Working Oxen—Stormy and no sales noticed.
Cows and Calves—Sales $20, 22, 24, 26, 39@41.
Sheep—$3, 3,50@4; extra, $5, 6, 7@9.
Swine—7@8c.; retail 8@9c.; fat hogs 5½c.

## NEW YORK CATTLE MARKET.

NEW YORK, May 23.—At Washington Drove Yard—Market quite active, and prices are well supported; the supplies were more numerous than of the preceding week and about all that were offered came from the South and West; we quote the range of the market from 8@10¼c, per lb. About 200 left over unsold.

At Browning's—In market 1,100 Sheep and Lambs,—all sold at prices ranging from $4@7,50 to $10 for Sheep; prices of Lambs at from $2,50 to $5.

Cows and Calves—80 offered, and all but 8 sold at from $25,50 to $45.

At Chamberlain's—Offered, 250 Beef Cattle—Prices ranging from 8½ to 10½c.

Cows and Calves—75 offered, and sales at $25@40 to 50.

Sheep and Lambs—1,500 offered; all sold at from $3,25@4,50 to $5,50@7 for Sheep, and $2,25@2,50 to $3,50 for Lambs.

## ALBANY CATTLE MARKET.

ALBANY, May 30.—W. W. Woolford's, Bulls' Head, Washington street.

Beef Cattle—At market, 550. Prices—Extra, $8,00; 1st quality, $7,50; 2d do, $7; 3d do, $6,50.

Cows and Calves—33 in market. Prices from $28, 30, 35 to 40.

Sheep—335 in market. Prices from $5, 5,50 to 5,75.

Swine—65 in market. Prices from $4, 4,50 to 5,50. All sold.

# Marriages.

In Greece, on the 24th ult., by the Rev. Jas. B. Shaw, D. D., Mr. THOS. C. HAVILL, Printer, of this city, and Miss ELIZABETH OSBORN, of Greece.

In East Palmyra, on the 19th ult., by the Rev. E. A. Platt, Mr. WM. C. TRACY, of Penfield, and Miss SARAH J. CLARK, of the former place.

**FOWLS FOR SALE.**

ONE pair each of Shanghais, Cochins, and Chittagongs,—ages from 9 to 12 months,—all buff except the pullet of the last pair, which is pheasant colored. Her mate has eaten from a dish, 31½ inches high from the floor, on which he stood firm. Price of this pair alone $12,50; of the three pairs together, $25. As to blood, this stock is from the hands of the importer. The last pair above is out of imported fowls. DAVID ELY,
179-2t. 69 Fitzhugh st., Rochester, N. Y.

**PALMER AND WILLIAMS' SELF-RAKING REAPER.**

THIS Machine was patented July 1st, 1851, and has been thoroughly tested the two past years. It is very simple in construction, having only one entire cog wheel and one pinion in the whole machine. The driving wheel is about 4 feet, and the ground wheel 30 inches in diameter; are so arranged as entirely to obviate the side draft, and hence a single team can manage it with speed and ease. The knife or sickle is scolloped, and cannot be clogged in any kind of grain. The grain is raked off so as to be out of the way of the team in repassing, and is in good shape for binding. The size of the sheaf is perfectly under the control of the driver. By a simple movement of his foot, he can throw the rake in and out of gear. If, however, he pays no attention to it, then the raking off will be done at regular intervals. In backing, the entire machine is thrown out of gear, and ceases to operate. *We* are the exclusive manufacturers of this Reaper for the harvest of 1853, and have been extensively engaged for several years in the manufacture of agricultural implements, and have examined the working of several Reapers, and received proposals for building others, but consider this far superior to them all. Such is our confidence in its superiority that we now have *one hundred* of them in course of manufacture, and shall be ready to deliver them on orders by the 1st day of June. We warrant the Reaper *well made* of good materials, durable with proper care, and capable of cutting better than by ordinary cradling, from 15 to 20 acres of standing grain per day, laying it in gavels for binding.

Appended are a few certificates of its operations:

JANESVILLE, Wisconsin, Jan. 12, 1853.

MESSRS. PALMER & WILLIAMS, GENTS:—After receiving your Reaper I laid mine aside, and finished my harvest with yours, (10 acres.) It is a perfect self-raker, it cuts the grain perfectly in all conditions, and rakes it off out of the way of the team in repassing. It runs lighter than any reaper I have ever used, two horses managing it with ease. Farmers can now rely upon a Self-Raking Reaper, that will work to their satisfaction. H. P. CULVER.

BATAVIA, October 6, 1852.

MR. PALMER, SIR:—I have cut 70 acres of wheat with the Reaper I purchased of you. Much of it was heavy and lodged. It cut it in the neatest manuer and raked it off better than it could have been done by hand, leaving the grain ready to bind. I only used one span of horses and cut nine acres and a half in 3 hours and 55 minutes. I cut nineteen and a half acres per day. I believe I can cut with one good team, 25 acres per day. I have used other kinds of Reapers, but consider yours vastly superior to all othrs; in a word, it is easy for a team, does the work well, and is a very great saving of labor and grain.
Yours, &c., C. R. BRINKERHOOF.

BATAVIA, N. Y., Oct. 25; 1852.

MESSRS. WILLIAMS & PALMER, GENTS.:—We, the undersigned, saw the Reaper (known as "Williams & Palmer's Self-Raking Reaper,") in full work in C. R. Brinkerhoof's wheat field, in the last harvest, in this town and we are glad of the opportunity to express our entire approbation in the work done, both in cutting the grain and raking it off the machine. We were surprised with its simplicity, and could not but aduire the ease with which the raking part is controlled.

H. U. SOPHER, H. H. CORBIN,
JOSEPH GATES, M. U. SOPHER,
JOHN DORMAN, E. HOWELL,
H. BOSTWICK, REV. A. STEELE,
CHESTER SCOTT, R. FERREN.

SWEDEN, Jan. 1, 1853.

MESSRS. J. GANSON & CO.:—I have examiued the Self-Raking Reaping Machine now being built by you. I have had a good deal of experience in harvesting grain with a Reaper, usually cutting my own grain, from 100 to 150 acres per year, and am free to say that I consider Palmer & William's Self-Raking Machine the best Reaper I have ever seen. F. P. ROOT.

BROCKPORT, Jan. 1, 1853.

MESSRS. J. GANSON & CO., SIRS:—I cut with the Self-Raking Machine I had of Palmer and Williams, in the last harvest, about 80 acres of wheat; some of it was badly lodged. I have tried several reapers, but consider yours vastly superior to any I have ever used. The raking off was well done. It drops the grain in good shape for binding, without leaving a trail. The cutting is done without clogging and the draft I think full one-third easier for a team than the ordinary reaper. ISAAC PALMER.

SPRINGFIELD, Ohio, July 2, 1852.

MR. PALMER:—This certifies that we were the binders of the grain on the final trial of Reapers, by the Ohio State Agricultural Society, and that it is our opinion that Palmer & Williams' Self-Raking Reaper left the grain in the best manner for binding of any Reaper on the ground, and that it done all its work equal to any of them.

SAMUEL PATTEN, JOHN MANGAN,
WM. A. REID, JOHN FARREL,
TIMOTHY MANGAN, MICHAEL HARD,
WM. FOSTER, *Owner of the Land.*

J. RAPALJE & CO., of Rochester, Agents for the Sale of above Reaper, will supply all orders at manufacturers' prices, transportation added. Machines are on exhibition at their Warehouse, No. 65 Buffalo street. 179-1t.

**FANNY FERN'S BOOK.**

TO PRINTERS.—FOR SALE.—A quantity of good Type, consisting of about 250 lbs. of Long Primer; 250 lbs. of Bourgeous; and 150 lbs. of Nonpareil.

Also, a number of Cases, Galleys, &c., &c.

Apply at the office of the Rochester Temperance Journal. 178wtf

**POETRY of the VEGETABLE WORLD.**

A POPULAR EXPOSITION OF THE SCIENCE OF BOTany and its Relations to Man. By M. J. SCHLEIDEN, M. D., Professor of Botany in the University of Jena. Edited by A. WOOD, M. A., author of the "Class Book of Botany." 1 vol., 12mo., illustrated, $1,25.

WHAT IS SAID OF IT.

Prof. Schleiden's capital treatise on the teachings of the vegetable world would pass muster with the most rigid utilitarian that ever existed. * * * It is as interesting as the most attractive romance, as beautiful as nature, and as pleasing as the finest poem.—*Boston Atlas.*

It is an interesting, amusing and instructive work.—*Philadelphia Pennsylvanian*

It is ingenious, learned and poetic—keenly admiring the beauties of nature, and thoughtfully evolving the great spiritual lessons which nature so eloquently teaches.—*N. Y. Evangelist.*

A series of full length *plant pictures*, which could only have been finished by one whose mind was full of their subjects, and one of that fullness could paint in the parts and details.—*Blackwood's Edinburgh Magazine.*

This is a unique and most entertaining as well as instructive work.—*Boston Traveler.*

It is a work of science, clothed in a beautiful garb of poetic imagery, and arrayed in fascinations of language that must charm every reader who is capable of feeling such influences.—*Louisville Journal.*

A proper treatise upon Botany, from which all forbidding technicalities are cleared away, and the science rendered as charmingly attractive as its floral subjects themselves.—*N. Y. Times.*

**For Sale, or to Lease for a term of years.**

A VALUABLE FARM, and genteel residence at Wellsboro', Tioga county, Pa. The homestead of late Hon. SAMUEL W. MORRIS, containing four hundred acres, will be sold entire, or may be divided into four eligible farms. Dwelling large and convenient, (16 rooms, besides halls, pantries, and garrets;) grounds well laid out, and in order; wood and ice houses; milk and wash room—running water in each of the latter.—Comfortable new tenant's house. Barn and stabling complete. Two good orchards. A fine sheep or dairy farm: will keep one hundred cows. A plank road connects with Corning and Blossburg Railroad, and the surrounding lumber region, gives also a home market for produce.

Town lots enough remain unsold to nearly pay for the property. Title unincumbered. Possession given in September, 1853. Price, twenty thousand dollars, large part of which may remain secured on the property, if preferred.

Also, several small farms, from 1 to 3 miles from the village. For further particulars refer to Editor of the RURAL; JOHN W. GUERNSEY, Corning, Steuben Co., N. Y.; JAS. LOWREY, or JOSEPH P. MORRIS on the premises. 179w3.

**THE TIME OF DAY.**

*New and Splendid Jewelry Store, just opened, with a New and Superb Stock of Goods, etc.*

JACOB PICARD, begs most respectfully to inform the public, that he has just opened the new, splendid and capacious Store, under the American Hotel, No. 96 State street, corner of Mumford street, Rochester, with an entirely new and superb stock of modern goods, recently imported or selected from the largest manufactories in New York, &c., in Watches, Jewelry, Clocks, Silver and Plated Ware, &c., which he is prepared to sell at prices lower than any other establishment in Western New York.

Those wishing to purchase will find at this Establishment an extensive variety of all kinds of goods to select from, all of which are of the best quality, and at the lowest prices.

J. P.'s stock consists of Gold Watches, from $25 to $225, warranted for one year. Silver Watches from $9 to $50; also warranted for one year.

Ladies' and Gentlemen's Jewelry, in immense variety, and combining all descriptions.

A large assortment of Clocks, from 1 day to 21 days' time, and from $1,50 to $75.

Mr. P. has constantly engaged, two workmen of considerable experience at Watch, Clock and Jewelry Repairing. Watches cleaned and kept in order by contract.

Buyers, remember the address:—JACOB PICARD, Watch, Jewelry and Clock Establishment, No. 96, corner State and Mumford sts., Rochester 179-tf.

THE WATER-CURE JOURNAL.—A New Volume.—Now is the time to subscribe.—Published monthly, in a beautiful quarto. Illustrated with engravings, exhibiting the Structure, Anatomy, and Physiology of the Human Body, with familiar instructions to learners. It is emphatically a Journal of Health, designed to be a complete Family Guide in all diseases.

TERMS—Only One Dollar a Year, in advance. Address, post-paid, FOWLERS AND WELLS, Clinton Hall, No. 131 Nassau Street, New York.

"The Water-Cure Journal holds a high rank in the science of health; always ready, straight-forward and plain-spoken, it unfolds the laws of our physical nature without any pretensions to the technicalities of science, but in a form as attractive and refreshing as the sparkling element of which it treats"—*N. Y. Tribune.* [178w4]

THE ILLUSTRATED AMERICAN PHRENOLOGICAL JOURNAL—Devoted to Phrenology, Physiology, Mechanism, Education, Agriculture, the Natural Sciences, and General Intelligence, profusely illustrated with Engravings. Every family, and especially all young men and women, should have a copy. Published monthly, at One Dollar a year.—All letters should be post-paid, and directed to

FOWLERS AND WELLS,
Clinton Hall, No. 131 Nassau-st., New York

Young men about launching forth upon the activities of life, and anxious to start right, and understand their course, will find this JOURNAL a friend and monitor, to encourage them in virtue, shield them from vice, and to prepare them for usefulness and success in life. The various occupations will be discussed in the light of Phrenology and Physiology, so that every one may know in what pursuit, he would be most likely to succeed.—PUBLISHERS.

**PREPARED SUPER PHOSPHATE OF LIME,**

BY THE UNION CHEMICAL WORKS, L. I.

**HOYT & CO., Agents,**

*No. 234 Water Street, and 122 West St., corner of Dey St., NEW YORK.*

A FERTILIZER of the most approved quality, producing all the immediate effect of the best Peruvian Guano, with the advantage of being much more lasting in the soil.—Thoroughly tested, and found to more than realise the expectations of all those who have already tried it. The best evidence of this is the largely increased demand this season over the past year. Put up in bags of 160 lbs; barrels 250 lbs each. Buyers will please be particular to observe our brand upon each bag or barrel.

Also for sale, American and Foreign Field and Garden Seeds. English Ray Grass, Foul Meadow Grass, fine mixed Lawn Grass, White Clover, Osage Orange, &c. 178m3i.

**GARDEN AND FIELD SEEDS**

*From the New Establishment of Van Zandt & Bowdish,*
No. 114 State street, Rochester, N. Y.

CAN be purchased of the merchants generally throughout the country, in Papers or Packages, on the most reasonable terms. Also at the Agricultural Warehouse of E. D. HALLOCK, No. 24 Exchange street, near the Clinton Hotel, Rochester, N. Y.

The Seeds from this establishment can be relied on as being of the very best quality. They are mostly imported, or grown by the EASTERN SHAKERS, and are warranted.—Full directions for cultivation printed on each Paper and Package. VAN ZANDT & BOWDISH.
Rochester, N. Y., 1853. 170m6.

**GREAT PRIZE MEDAL.**

THE WORLD'S FAIR AT LONDON, awarded us a MAMMOTH SILVER MEDAL for the BEST HATS.—Gents wishing the Spring and Summer style, will call. We are prepared to serve you with a superior article, and of the most becoming style.

CLARK & GILMAN, 23 State St.,
[169-3m.] Rochester N. Y.

**IMPROVED SWINE FOR SALE.**

THE Subscriber having been engaged twenty years in rearing and breeding swine, has finally produced a breed equal, if not superior, to any in the United States, for both pedigree and quality. They are bred from the best specimens of Leicestershire, Lincolnshire and Byfield,—the last cross from a pure Suffolk. A description of them would be—a pure white, having not a particle of black scurf on the skin, great length of body, holding their size well from end to end, small heads and legs, the pork of the finest texture, having very thin, tender skin. With regard to fattening, they are always ready to kill from three weeks old: if well fed they attain a weight of from two to three hundreds pounds at nine months old.

The numerous applications for my stock of hogs for several years past, has induced me to breed largely the past year. I have about one hundred pigs at present for sale, and shall continue to breed them at all seasons of the year, having conveniences for so doing. I will ship them to any part of the United States, by railroad or canal, carefully boxed and labeled, with sufficient feed. The prices will be from ten to fifteen dollars each, at from six to ten weeks old. GEORGE SHEFFER.
Scottsville, Monroe Co., N. Y., May, 1853. [178w4]

**GENESEE VALLEY NURSERIES,**

*ROCHESTER, N. Y.*

THE season being at hand to set bedding plants, which will continue till the 15th of June next, A. FROST & Co., respectfully announce that they offer this Spring one of the finest collections of Dahlias, Verbenas, Petunias, &c., &c., in the Union, comprising upwards of THREE HUNDRED VARIETIES, many of which they imported directly from the European growers at great expense. All of which they will pack in such a manner that they will reach their destination in perfect safety, and forward the same to any section of the country, at following reduced rates:

| | | | |
|---|---|---|---|
| Dahlias, each, | 25 cents; | per dozen, | $2,00 |
| Verbenas, do | 18¾ " | " | 1.50 |
| Petunias, do | 18¾ " | " | 1.50 |
| Heliotropes, do | 25 " | " | 2,00 |
| Fuchsias, do | 25 " | | |
| Salvias, do | 20 " | | |
| Roses, everblooming, | 37½ cents. | | |

For other plants and prices, see Catalogue. Where the selection is left to us, parties can depend that none but good plants will be sent out, and only *the most distinct and best sorts.*

☞ All money, properly enclosed, may be sent by mail at the risk of the Proprietors. A. FROST & CO.
17-w2.

**TO FARMERS.—THE PLOW REGULATOR!**

WE, the undersigned, having used Harvey Sprague's Improved Plow Regulator, and tested it to our satisfaction, have no hesitation in saying that it makes the draught of a plow from one-eighth to one-fourth easier for the team, and holds one-half easier for the plowman; it being so constructed that the whole weight of the plow and the furrow resting thereon, rides wholly on the wheels. It also carries the plow much steadier on uneven ground, and does away with the difficulty, arising from the common wheel, in finishing the last furrow of the land.—Considering the durable and simple nature of this invention, with the many advantages which it possesses over other wheels, we would recommend it to all Farmers.

M Dale, M R Sprague, H Sprague, Riga.
L Bangs, Churchville.
J Richmond, D Perry, Ogden.
C Smith, Sweden.

Those wishing the "Plow Regulator," by remitting $5 to Harvey Sprague, Churchville, N. Y., will have one forwarded immediately as they may direct. All orders promptly attended to.

The subscriber will dispose of right of Patent for different parts of the United States, on reasonable terms.—Address as above, or apply personally, at his residence, one mile east of Churchville, near the Railroad.
2t174-179. HARVEY SPRAGUE.

**S. W. DIBBLE,**

*Dealer in Allen B. Wilson's Stitching Machine.*

OFFICE, No. 8 Smith's Arcade, Rochester. This Machine works on an entire new priciple, and is said by scientific judges to be THE BEST MACHINE EVER INVENTED FOR SEWING.

It is simple in its construction, not liable to get out of repair, and stitches the finest linen, cotton or woolen goods in a superior manner. Tailors, seampstresses, cap makers, dress makers, and shirt and collar manufacturers will find this to be the best Machine ever invented for their use. Single Machines or County and Town rights, for its exclusive use, for sale on such terms that the purchaser may be sure of a handsome return from the investment. 178w4.

**FERTILIZERS.**

| | |
|---|---|
| PERUVIAN GUANO | $45 per ton. |
| Super Phosphate of Lime | 2¾ cents per pound. |
| Bone Sawings, or Meal | $2,50 per barrel. |

| Sulphuric Acid | 2¼ to 2½c. " |

For sale at the State Agricultural Warehouse.
LONGETT & GRIFFING,
178w8. No. 25 Cliff Street, New York.

**GENESEE PAPER MILLS.**

CO-PARTNERSHIP NOTICE.—The subscribers having purchased the Genesee Paper Mills property, have this day formed a Co-partnership, under the name and firm of Adams, Huntington & Co., for the purpose of Manufacturing Printing Paper, and dealing at wholesale and retail in all kinds of Paper Stock. Office and Warehouse, No. 93 State street.

FRANCIS T. ADAMS. E. T. HUNTINGTON,
WILLIAM A. ADAMS, ALVAH STRONG,
ALBERT M HASTINGS, D. D. T. MOORE.
Rochester, April 15, 1853.

WHEN CORN'S PLANTED, WEEDS BEGIN TO START.—Get a good Cultivator, made to expand or contract to suit the times. They are death on weeds; and without elbow grease, will keep the soil mellow, and fill the crib in Autumn. Sold at
177tf HALLOCK'S 24 Exchange st., Rochester.

**Imported Horse, "Consternation,"**

WILL stand this season at the farm of the subscriber, two miles west of Syracuse and adjoining the village of Geddes. His colts and fillies are already in demand for breeding. Several have been sold during the past winter, at handsome prices, to go out of the State.

Terms.—$10 for the season, and $15 to insure; the money to be paid in advance in all cases. When a mare is insured and left at the farm of the subscriber, or regularly returned to the horse until the groom is satisfied she is in foal, a receipt will be given promising to refund the money if the mare was not got in foal. Pasturage furnished at three shillings per week. Mares to be at the risk of owners in all respects. J. B. BURNETT,
May 14. [177-

# Poetical.

For Moore's Rural New-Yorker.

## "OH FOR A HOME."

Oh! for a home, 'mid those sylvan shades!
'Mid the sighing winds, and the shadowy glades
Where the sheltering arms of the giant trees,
Seem beckening to me, as they wave in the breeze.

Oh for the joys of the forest home,
Where the wild birds sing, and the sweet winds roam,
Where the star-like flowers raise their dewy eyes
To woo one glance from the azure skies.

Oh for a home, 'mid the rustling leaves:
'Neath the towering dome that the forest weaves,
Where the mystic shades in the tree-tops lay,
And the wood-nymphs dance in the moonlight ray.

Oh for a home, in some solitude deep,
By a wild, wild stream, or a craggy steep,
Where alone I may wander, where footstep ne'er trod,
And worship with Nature, the grandeur of God.

Barre, N. Y., May, 1853. VIANA MEADOWS.

# Rural Sketch Book.

## THE WIFE'S FORETHOUGHT.

### A SKETCH FOR YOUNG MARRIED PEOPLE.

BY SYLVANUS COBB, JR.

ANSON KIMBALL had been married about a month. His business was at tin-making, and he had a shop of his own, and his whole stock was paid for, so he felt quite independent, the future looking all clear and bright. His wife was one of those mild, loving creatures that hang fondly upon the interest and affections of the husband, and whose soul may sink or swim with the fortunes of the being it has chosen as a partner.

One evening the young couple were sitting in their comfortable apartment, the husband engaged in reading, and the wife working busily with her needle.

"I must be up early to-morrow morning, Linnie, for our party starts shortly after sunrise," said Anson, as he laid down his paper and leaned back in his chair.

"Then you are going, are you?" remarked Linnie. There was just regret enough in her tone to render her voice less lively than usual, but it must have been a very keen observer that could have noticed it.

"O, to be sure," returned the young man, in a gay, laughing tone. "You know the hands in the old shop go on this salt-water fishing excursion every year, and of course I must go with them. We can't take our ladies with us on such a trip, but you shall have a good time to make up for it."

"You mustn't think, Anson, that I envy you the pleasure you anticipate, for I am sure that nothing can give me more satisfaction than to know that you are enjoying yourself."

"I believe you, Linnie; and I assure you I shall enjoy myself on this trip exceedingly. So you will be happy, too, eh?"

"Certainly," returned the young wife; but the word seemed spoken reluctantly.

"Come, come, Linnie, you don't speak as you feel. Now you don't want me to go," said Anson, with a tinge of disappointment in his tone.

"If you think it would be for your good to go, of course I should want you to go."

"And how can it be otherwise?"

"You wont be offended, Anson, if I tell you."

"Pch, what an idea. I be offended at you? Come, tell me your thoughts."

As the young man spoke he moved his chair to the side of his wife, and put his arm about her neck.

"Well," returned Linnie, in an earnest, yet pleasant tone, "I was thinking of the expense."

"Ha, ha, ha! The *expense*. Why, it wont be over five dollars at the farthest."

"But, five dollars is considerable. You know we are young yet, and all we have is the house we live in, and your small shop."

"And is not that enough? How many of my young friends are there who are even so well off as that?"

"I know you are fortunate, Anson, but none are beyond the reach of misfortune.—For a few years we had better live as economically as possible with consistent enjoyment."

"So I intend to; but what is five dollars compared with the amount I shall be able to lay up in a year."

"Why, it will make that amount some eight or ten dollars short."

"That's strange logic, Linnie."

"Not at all, Anson. You will spend five dollars in money, and lose the time of two working days."

"So I shall: but I tell you, Linnie I'll work enough harder for it when I come back. So I may go, mayn't I?"

This last sentence was spoken playfully, and the young man kissed his wife as he spoke.

"Of course you may," returned Linnie, with a smile; "but I suppose I shall have to go without a little sum I had wanted."

"How much was it?"

"Five dollars."

"O, you can have that, of course, and more too, if you want it."

"That will be enough."

Anson Kimball took out his wallet and handed his wife a five dollar bill, and the conversation then turned upon other and various matters.

Anson Kimball was like thousands of others who are situated in like circumstances. With a free and open heart he marked out his future for a field of enjoyment, without taking care to make much preparation for the sum he might be likely to meet on the way. And then again like all others, he mistook the character of life's real enjoyment. He lost sight of some of the higher and more noble sources of happiness, and dwelt too much in the satisfaction of the physical appetite. True, he enjoyed himself and kept clear of all extremes, but yet he failed to see that his enjoyments were nearly all ephemeral—that he was laying up little or nothing for time to come.

A year passed away, and the annual fishing excursion came in course along.

"Well Linnie," said the young man, "tomorrow the boys go down the harbor, and I am going with them. Of course you have no objections."

"No," returned the wife, in her usual pleasant tone. "If you can afford it."

"O, there's no trouble about that."

"Don't you remember the conversation we had a year ago on this same subject?" asked Linnie.

"Yes,—I remember then you talked about saving money, but we aint any poorer now than we should have been if I had staid at home."

"But tell me, Anson, have you laid up as much during the past year as you had expected to?"

"Why, as for that matter, I haven't laid up much of anything. The fact is, Linnie, you have drawn rather harder on me than I expected."

"But I havn't spent any more money for trivial affairs and amusements than you have, Anson, and I don't think I have so much."

"I didn't mean to blame you, my dear. I only mentioned the circumstance to explain why I had not laid up anything. But never mind, there's time enough yet, and besides we've enjoyed ourselves. I think after this fishing excursion is over, however, I shall begin to dock my expenses a little, for I must lay up a little something the next year."

"We certainly have every chance to save money," returned Linnie, "for both the house and shop are ours without rent, and we are free from debt."

Anson Kimball started at that last remark, and turned his face towards the window, but his wife did not appear to notice his emotion.

"You know, Anson," continued Mrs. Kimball, "that you promised me I should have five dollars when you went on another excursion, and I shall certainly hold you to that promise."

"Of course—that's fair," returned the young man; "but do you need it now?"

"Yes."

"What are you going to do with it?"

"You won't be offended?"

"No."

"Then, to tell you the truth, I owe a little sum."

The young man looked earnestly at his wife, and though he evidently wished to say something about her running in debt, yet for reasons best known to himself, he kept quiet, and handed over the five dollars.

Anson joined his old shopmates on their excursion, and when he returned he thought some about beginning to cut off some of his unnecessary expenses, but he introduced no new system of operations. Two or three times he did refrain from indulging some petty appetite, but he soon settled back into the old track, and the small bits of money slipped away as fast as ever.

Three years had passed away since the young couple were married, and few could have wished for more social comfort than they had enjoyed during the greater part of that time. For a month or two, however, the young man had been gradually growing more sober and thoughtful, until at length he had become really sad and down-hearted. His wife had endeavored to cheer him up, though she was unable to learn the cause of his dejection.

One evening, just before dusk, Linnie saw two men pass her window and enter her husband's shop. One of them she knew to be the sheriff, and the circumstance troubled her not a little. She waited half an hour for her husband to come to supper, but he did not appear, and her sufferings began to be acute. A thousand conjectures flitted through her mind, but they brought her no consolation, and at length she determined to go to the shop door and see if she could not overhear something of what was passing within, feeling that such a course would at least be pardonable.

Linnie stole out from her front door and went towards the shop. She placed her ear to the key-hole and listened, but she could only hear an indistinct hum of voices, among which was that of her husband. The latter was evidently supplicating, for his tones were earnest and impassioned. Soon there was a movement of feet towards the door, and Linnie hastened back to the house. Ere long her husband entered. He looked pale and troubled, and with a nervous movement of the muscles of his face, as though he would have concealed the grief that bore him down, he took his seat at the table.

Poor Linnie watched her companion with an anxiety almost agonizing, but she spoke not a word until after Anson had set back from the table. The food remained almost untouched upon his plate when he moved away, and he would have left the house had not his wife stopped him.

"Husband," she said, in a soft, gentle tone, at the same time laying her hand upon his arm, and gazing imploringly into his face, "what is it that troubles you?"

"Nothing, Linnie," half fretfully returned he, and he made a motion as if to remove his wife's hand from his arm.

"There is *something*, Anson, I know there is. Come, do not keep it from me."

"There is nothing that you need know."

"But a wife need know all that can affect her husband thus. What is it, Anson?"

"It is nothing but my own business, and a wife need not know all that."

This answer was harsh, and tears gushed to Linnie's eyes.

"My dear husband," she said, in tender accents, "to whom, O, to whom, should you tell your sorrows, if not to her who loves you better than life itself?"

"Forgive me, forgive me, Linnie—I meant not to wound your feelings. I am very miserable, and I hardly know what I said."

"Then tell me all. Come, sit down in my easy chair, for your brow is hot and feverish. There,—now tell me."

After the young man had taken the proffered seat, he gazed for a moment into the face of his wife, and a look of deep anguish rested upon his features.

"Linnie," he said, "I may as well tell you all, but you must not chide me, nor must you despond, for all is not dark as might be. I am deeply in debt, and to-morrow my shop, and all that it contains, will be advertised by the sheriff for sale."

"In debt," murmured the wife.

"Yes. During the last two years I have been purchasing stock on credit, and paying for it as it has been convenient. At first it seemed an easy way of doing business, but it has proved fatal; for when I received the pay for my goods I forgot, or at least did not sufficiently heed, that all that money was not mine. I forgot that more than half of all the money I received belonged to the men of whom I had purchased stock. Two notes fell due day before yesterday. The man to whom I gave them sold them in the way of business to a western firm, and now they must be paid. To-morrow an officer will be placed in my shop, and nearly everything will have to be sold. It is not the loss of my stock and tools that I care so much about, for I have health and strength, and I can earn more, but it is the disgrace of the thing. To think that I should fall like this, — me — a healthy, stout, good mechanic."

"How much do you owe?" asked Linnie, in a trembling voice.

"Both notes amount to four hundred dollars."

"And haven't you any part of it?"

"Only about fifty dollars that I can collect readily."

"And if these two notes were paid, you would be safe?"

"Yes."

"Then, thank God, you will not suffer!" exclaimed Linnie. And overcome by her feelings, she sank upon her husband's neck, and burst into tears.

"Linnie, Linnie," cried the young man, "what do you mean?"

"Wait a moment, my husband."

The wife brushed the tears from her cheeks as she spoke, and left the room, and in a few moments she returned, bearing in her hand a small book. There was a bright smile upon her face, and her husband looked upon her with astonishment.

"Here, my husband," she said, stepping to his side and placing the book in his hand, at the same time winding her arm about his neck, "if you carry that to the bank they will give you three hundred and seventy-five dollars for it."

"Three hundred and seventy-five dollars!" repeated the astounded man, hardly crediting the evidence of his own senses.

"Yes, Anson," returned the wife, sinking into her husband's lap. "That is money that I have been laying up during the last three years."

"*You* laid it up, Linnie? But where could you have got it?"

"You gave it to me yourself to spend for *trifles*. You know I have claimed my share of such money. Do not blame me, Anson; but I feared that you did not attach sufficient importance to the aggregate of the small sums you were almost daily spending. Once or twice I would have remonstrated, but you could not be made easily to see it. I was but a young girl, and I feared to set up a will against my husband, so I resorted to this means of proving my position. O, my dear husband, you cannot know what sweet pleasure I experience now in finding that my experiment has been the means of such good."

"If your pleasure is equal to mine, then you must be happy indeed," exclaimed Anson, as he drew his fond wife to his bosom. "God bless you, Linnie, and make me able to repay you for this. Now I see to whom you have *owed* the little debts you have sometimes contracted, and which I have helped you pay."

"Yes," returned Linnie, with a smile.—"It was to you I owed them. And yet," she added, with a meaning look, and in a lower tone of voice, "I have not drawn quite so much from the *amusement fund* as ——."

"Hush, Linnie. I know I have spent more than I was aware of, but my eyes are open now, and I see it all."

"And you do not blame me for what I have done."

"Blame you?" exclaimed Anson, imprinting a warm kiss upon his wife's brow. "Let my future course show you how fondly you are cherished, and how faithfully I will be guided by your judgment."

On the next day Anson Kimball paid off those who would have sold his stock, and he had the pleasure of tearing his two notes in pieces. He spent no more money foolishly, and as he found the products of his labor beginning to gather in his hands, his home grew brighter, and his enjoyments were increased. By steady degrees he rose to a position of honorable affluence, but through all his successes he never lost sight of the gratitude he owed to the gentle, faithful being who had first opened his eyes to a knowledge of the secret of success, and saved him from pecuniary disgrace. He was an honored and respected man, but he felt he owed it all to his WIFE'S FORETHOUGHT.

---

IT is with great men as with high mountains. They oppress us with care when we stand under them; they disappoint our insatiated imaginations when we are nigh, but not quite close to them; and then, the further we recede from them, the more astonishing they appear; until their bases being concealed by intervening objects, they at one moment seem miraculously lifted above the earth, and the next strike our fancies as let down from heaven.

# Wit and Humor.

CUT A DIDO.—It is told in history that Dido, Queen of Tyre, about eight hundred and seventy years before Christ, fled from that place upon the murder of her husband, and, with a colony, settled upon the Northern coast of Africa, where she built Carthage. Being in want of land, she bargained with the natives for as much land as she could surround with a bull's hide. Having made the agreement, she cut the bull's hide into fine strings, and tying them together, claimed as much land as she could surround with the long line she had thus made. The natives allowed the cunning Queen to have her way, but when any body played off a sharp trick, they said he had "cut a Dido," and the phrase has come down to our day.

GOLD DIGGING HUSBANDS.—Young ladies are especially recommended to marry those young gentlemen who have returned from the "Diggings," as, independently of their golden charms, they make most domesticated husbands, and are especialy recommended as being adepts, from long practice, at *Rocking the Cradle.—Diogenes.*

A BAD PLAN.—How many fond mothers and frugal house-wives keep their pretty daughters and preserves for some extra occasion—some "big bug" or other, till both turn *sour*. This seems to us to be marvelous poor economy.—*Ex.*

NOT BAD.—A late English writer says that the only day an American devotes to "relaxation," is the day he takes medicine. Not a bad put in, that.

THERE is a pork and lard shop up town that has a sign stuck up inside, of "No whistling allowed while sausages are lying on the counter!" Sensible man that, and his sausages are *dog* cheap.

VERY few people are truly wise, but a great many, an immense majority, are *otherwise*.

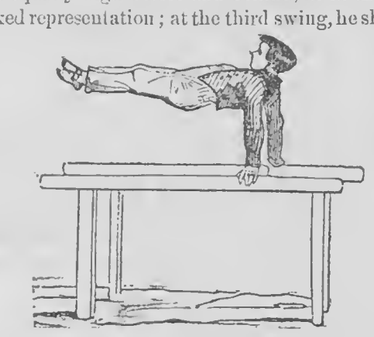
DON'T rely too much on the torches of others; light one of your own.

# Youth's Corner.

"Attempt the end, and never stand to doubt;
Nothing's so hard, but search will find it out."

## PARALLEL BARS.

IN these exercises, the pupil should begin by raising his body by his hands, as shown in the illustration; he should then pass from one end of the bars to the other by alternately moving his hands, and next practice the same motions backward.—He should afterward endeavor to pass along, by moving both hands at once, keeping his legs close and straight. In performing the swing on the bars, the pupil must support his body on his arms, and swing from the shoulders, allowing his feet to rise equally high before and behind, as in the annexed representation; at the third swing, he should



throw his body over the bar, either to the right or left, leaving hold of the opposite bar the same instant; this he must also practice backward. In lowering the body by bending the elbows, he must gradually sink his body until his elbows are even with his head, at the same time drawing up his feet toward his hams, but he must not allow his knees to touch the ground; he should then straighten his arms, and regain his original upright position on the bars. Another exercise may be performed thus: when the pupil is in the position represented in the first figure, the right elbow should be lowered to the bar, and after that the left; the right arm should then be lifted up, then the left, and the first position resumed.

## CHARADE.

My first is the name of a fish, also a kind of tree.
My next signifies to make, to originate.
My third is a State in Germany.
My fourth is an excellent fruit.
My fifth is a man's name.

Take the initials of these words, and they spell a book that should be in every family. While the finals express an article of furniture which should be in every house, and it is also the most proper place for the book. TENE.

Poolville, N. Y., 1853.

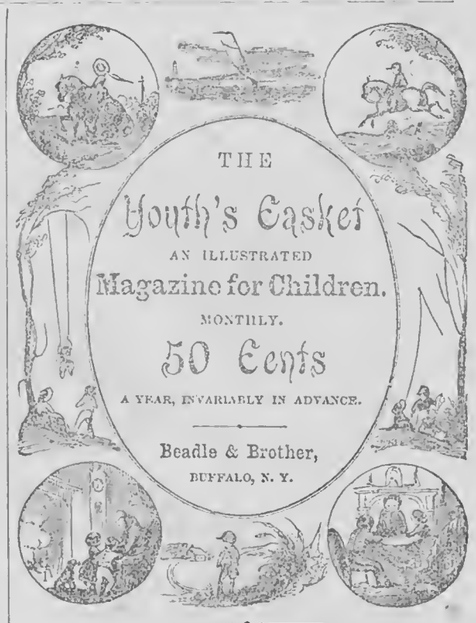
## ANSWER TO ENIGMA, &c., IN NO. 22.

Answer to Miscellaneous Enigma—*The Tomb of Washington.*



**AGENTS WANTED!**

THE CASKET is now fairly established, and the success of the enterprise beyond doubt, which enables the publishers to enter with renewed vigor into measures for extending its circulation. We feel very thankful for the many flattering compliments which we are daily receiving from private letters and the press, all of which agree in pronouncing the Casket the

**Cheapest Juvenile Magazine in the World.**

And that all our little friends, that every boy and girl may have the pleasure of perusing our magazine, we want *Ten Thousand Agents* to canvass for, and circulate the Casket, in every school-district, town and county, in the United States and Canadas, to whom a liberal percentage will be given. Specimen numbers furnished *gratis* on application. Send for one number and circulate it among the *little folks*, and you will confer a greater blessing than distributing gold and silver. Try it.

Address, *post-paid*, BEADLE & BROTHER,
*Buffalo, N. Y.*

166-1am-tf.

**PROF. BROWN'S NEW STORE,**
**With New Goods, and Enlarged Accommodations**

CITIZENS OF ROCHESTER and Surrounding Country:—Grateful for past favors, I hope for a continuance and increase of the same. The front part of the store is exclusively for the sale of Goods; the rear for Shaving and Hair Cutting; the basement is a private room, divided into two, for the purpose of Coloring the Human Hair.

GENTLEMEN'S FURNISHING GOODS.—Every article in this line. Collars of the latest make, and a larger stock than can be found elsewhere in this city.

HAIR WORK of every kind—the largest assortment made from the best materials, and shall be sold at the lowest prices. Perfumery, of my own and foreign make. Hair Oils that cannot be excelled. Brown's Antispassis and Hair Restorative, a well known article. Brown's Liquid Hair Dye, the best in the world.

A variety of Useful and Ornamental Articles too numerous to mention, at retail, but which I respectfully invite the public to examine.

FISHING TACKLE.—Sportsmen, call and see.

TO LADIES.—A lady will be in attendance in the front Store.

☞ Eight Chairs are kept in this establishment, giving that number of persons a chance to be shaved at once—Nine persons are employed, showing the popularity and success of the proprietor. PROF. BROWN,

[129-tf] No. 26 Buffalo St., Rochester, N. Y.

**ROCHESTER STEREOTYPE FOUNDRY.**

THE undersigned would respectfully inform the public—and especially book and periodical publishers, authors, &c.—that he has established a STEREOTYPE FOUNDRY in Rochester. His establishment is furnished with every facility for Stereotyping, in the best manner, Books, Pamphlets, Periodicals, Cuts of all kinds, (including figures of animals, implements, etc.) Patent Medicine Advertisements, &c., &c. Plates blocked in a superior style on mahogany. All work executed with promptness and on reasonable terms, and equal in style and finish to that done at any other Foundry in the country.

An establishment of this kind has long been a desideratum in this city, and now that one is in operation, it is hoped a liberal share of patronage will be awarded to the enterprise.

☞ Foundry in Talman Block, Buffalo street. All orders from a distance may be addressed to

J. W. BROWN,

April, 1852. [122-1am-tf] Rochester, N. Y.

N. B.—Old type taken in exchange for work.

**HALLOCK'S HAND SEED DRILL.**

THIS Drill is adapted to sowing carrot, turnip, beet, onion, and other small seeds in drills, with perfect regularity and without regard to their weight or shape.—The seeds are forced out by a circular brush, which revolves against a perforated tin plate inserted in the bottom of the hopper. A series of these plates accompany each drill, with holes of different sizes for regulating the quantity and kinds sown. It is a light, compact, and durable machine, and not liable to get out of order. They can be forwarded to any part of the country by railroad or stage. Remittances by mail at my risk. All orders (which should give full directions for forwarding,) promptly attended to.

Price, $5. Address E. D. HALLOCK,

168eowtf. Rochester, N. Y.

**MOORE'S RURAL NEW-YORKER:**
A WEEKLY HOME JOURNAL,
**For both Country and Town Residents.**

PUBLICATION OFFICE,
BURNS' BLOCK, CORNER STATE AND BUFFALO STS.,
ROCHESTER, N. Y.

**TERMS, IN ADVANCE:**

TWO DOLLARS A YEAR—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

**Terms of Advertising**

ONE DOLLAR per square (ten lines—100 words, or less,) for each insertion,—*in advance*. ☞ The circulation of the NEW-YORKER is much larger than that of any other newspaper published in the State, out of New York city. Only a limited space, however, is devoted to advertisements, and hence preference is given to those most appropriate—such as the cards and notices of dealers in Agricultural Implements and Machinery,—Horticulturists and Seedsmen,—Booksellers and Publishers,—Inventors, etc. All orders by mail should be accompanied with the cash.

To enable us to accommodate as many as possible, brief advertisements are preferred. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

**THE WOOL GROWER AND STOCK REGISTER.**

THIS is the only American Journal primarily devoted to the interest of Wool and Stock Growers, and should be in the hands of *every owner of Domestic Animals*. It is ably conducted, published in the best style, and finely illustrated. Each number contains a careful Review of the WOOL and CATTLE MARKETS, and much other *useful* and *reliable* information which can be obtained from no other source. The Fourth Volume commenced in July last.

TERMS:—FIFTY CENTS A YEAR; Five Copies for $2; Eight for $3; Eleven for $4. Back volumes, bound in paper, at 40 cts. each,—unbound at 35 cts., or three for $1.

Published monthly, in octavo form. Specimen numbers sent free. Money, properly enclosed, at our risk.

Address D. D. T. MOORE, Rochester, N. Y.

# MOORE'S RURAL NEW-YORKER.

VOLUME IV. NO. 24. ROCHESTER, N. Y.—SATURDAY, JUNE 11, 1853. WHOLE NO. 180.

MOORE'S RURAL NEW-YORKER:
A QUARTO WEEKLY
Agricultural, Literary and Family Newspaper
CONDUCTED BY D. D. T. MOORE,
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter—interspersed with many appropriate and handsome engravings—than any other paper published in this Country.

☞ FOR TERMS, &c., see last page.

## Rural New-Yorker.

### Progress and Improvement.

### RURAL AND DOMESTIC ECONOMY.

ECONOMY, whether Rural or Domestic, is not stinginess. It is such a use of all objects or things as shall be productive of the greatest good to the person employing them. The individual, therefore, who best understands the art of attaining the end from the beginning, with the least possible expenditure, commensurate with securing the greatest gain of any sort or kind, is the best economist.

No person can become a good economist in any department of labor or business without careful study and diligent observation. The laws regulating production and expenditure must be well understood. He that is guided by tradition, rather than by the teachings of art and science, is not so likely to succeed in any business as he would be were knowledge his guiding light.

There are, relatively speaking, very few good economists. To no class is this subject of greater importance than to the farmer. The requisites with him are two—labor and the farm. Labor is chiefly of two kinds: that produced by the employment of human muscles, and the muscles of horses and oxen. To be productive, labor must be directed by cultivated mind, else the best means to compass the end desired, will not be put in requisition.

The question every farmer should propose to himself, is not, what I must desire to raise on my enclosed acres, but, what is my soil the best adapted to produce? If wheat, then study how to produce the greatest amount for a given expenditure;—that is to say, there is a relation between what is expended in order to make a crop after it is gathered. For example: if a man in the ordinary course of farming, finds that the crop can only be produced by the use of such extraordinary and costly stimulants, that, when harvested and marketed, it will scarcely balance the bill of expenditures, he very naturally concludes that it will not be economy for him to pursue such a course. If your farm be better adapted for grass than wheat, then you should raise stock or keep a dairy, or both, and exchange your productions for wheat, rather than at a sacrifice try to raise it for home use. If you can produce two bushels of oats easier than you can one of wheat per acre, then is it not better economy to produce oats?

To know, then, what it is best to cultivate on any given area of the earth's surface—it is necessary to know what the nature of this soil is. It must, then, be chemically analyzed, or tested by experiment, the latter being far more costly of the two ways.—Knowledge, therefore, must be employed.

It being a well known fact that every crop taken from the soil exhausts or impoverishes it, it becomes an important inquiry to the farmer, how shall I replenish my soil if I sell my crops? If I sell a thousand bushels of wheat annually, how shall I restore to the soil whence it was taken, the sum of the compounds removed therefrom? Here is an important problem for every rural economist to solve. The manure heap is the farmer's source for replenishing the soil whence the crop has been removed—or at least one source. Plowing in green crops, as of clover, is another. The latter is regarded by some as the most economical way to prevent exhaustion of soil. Farmers, as yet, come very far short of saving all the elements of manure which they have. It is said of the cow in STOCKHARDT'S Field Lectures, that "one cow furnished yearly 20,000 lbs. in excrements, and 8,000 in urine; one horse 12,000 in excrements and 3,000 in urine; one sheep, 760 in excrements and 380 in urine; and one hog 1,800 in excrements, and 1,200 in urine. What farmer saves or makes, use of manures in proportion to the above statements, according to the number of animals kept? This can be done under the guidance of good economy. We shall recur to the subject again.—W.

### JUNE.—FARM AFFAIRS.

"FAIR SEASON! sacred to the blushing flower,
Whose leaves were stained by Venus' wounded feet
When her Adonis she would save—most meet
For every bird too, in both grove and bower,
To send its minstrelsy forth, so loud and sweet,—
Thee, with as fond but meaner music's power
We welcome, and thy gen'rous advent greet!
Thou bring'st with thee an Alchemy most strange
Compound of all the sweetest things on earth:—
Through the wide round of vast creation's range,
Or circling dance of its eternal change,
No Month like thee produces at a birth
Such fruit and flowers—melody and joy,—
Which, it would seem no winter might destroy!"

JUNE was named from the goddess JUNO. The Saxons named it *Weyd-monath*, and afterwards *Veer-monath*, dry month. The former name was bestowed because their herds did then *weyed* in the meadows, i. e., feed there.

June is called the "leafy month" and is well entitled to the appellation, since every tree puts on full and perfect foliage and, with variety of hue greatly diversifies the landscape scenery which is fast becoming beautiful, complete, and attractive beyond comparison.

With the change of the months, does the occupation of the farmer change. As May was the month for planting, so in the progress of the season is June the month for cultivating, and taking care of what was planted in the preceding month, as well as to plant what has not yet been seeded.

Between the planting and hoeing time in the Rural districts, comes the sheep-shearing business. After this, hoeing and general or specific improvements are made—such as draining, preparing fallow ground for wheat or rye, replenishing the compost heap from the road-side or the muck swamp.—Every farmer who sells any part of his produce, should provide some means to return to the field what has been removed from the same, by the sale of the crops, or any portion of them.

Attend well to the weeds, or else they will rob your corn and potatoes of that nutrition which is necessary for them. It used to be a rule, to hoe corn three times and potatoes twice. The true way, however, is to stir the ground just as often as it will benefit the crops that are maturing.—Since the introduction of improved farm implements, the old-fashioned way of hoeing is not so much practiced. We should, nevertheless, prefer the hoe to the cultivator, provided the labor could be performed just as cheap. Kill the weeds, no matter how, provided it be the cheapest and most effectual method, for you will admit that the best way is always the cheapest, i. e., "in a long run," as the old saying teaches.

Crops grown for manuring, such as clover, buckwheat, vetches or any others, should be plowed in just at the time they are passing from full flower. They are then in their best possible condition for manuring purposes. This we deem one of the cheapest ways of fitting the soil for a good crop.

A good farmer in the Connecticut valley, some years since, told us that he tried the following experiment:—A field whose soil was nearly uniform, was one-half of it seeded with clover, and when in full bloom, was turned in with the plow: the other half was well manured with good stable manure.—The whole was planted with corn the next season. During the time of growth, he remarked that it was easy, even at some distance from the field, to see the manifest distinction between the effects of clover and manure. The corn, upon that half of the field where the clover was plowed in, was of a much darker color than the other, grew more thrifty, and at the time of harvest yielded a much more abundant crop. There are facts, many of them, of a similar kind. And from such considerations, we have, for a long time, regarded the manuring with green crops, as the cheapest method of enriching the soil and preparing it for a crop, that can be employed.

Among the miscellaneous work for this month, is that of getting ready for haying. The barn is to be put it readiness—the cart or wagon is to be made ready, the scythes, the pitch-forks, the rakes, whether horse or hand, help to be engaged—and the extras of all kinds for which the thoughtful husbandman makes careful and timely provision.

We have only hinted at some of the farm work for June. If what has been said shall prove suggestive or tend to strengthen the good purposes of the many enterprizing farmers who *read* the RURAL, we shall be glad, for it is the *suggestive* as well as the hortatory and didactic qualities of what we read that render it valuable to us.—W.

### CABBAGE AS A FIELD CROP.

THE cabbage (*brassica oleracea*) is a native of Great Britain. It is found growing wild in various parts of England and Scotland, but only the experienced eye of the botanist could detect in the uncultivated indigenous plant, the esteemed production of the field and garden. This vegetable luxuriates in a deeply rich soil and a humid atmosphere; hence it is found in its greatest perfection in the British Islands and the low countries of Europe. When transplanted into warm countries, unless abundantly irrigated, it not only becomes stringy but loose much of its native succulency and becomes greatly contracted in its dimensions. In all the Northern and North-Western States of the Union, it is conceded that, in the majority of cases and seasons, cabbage would succeed as a field crop.

The varieties most approved of for cultivation, are the Early May, Early York, Chinese, Large Sugar-loaf, Ox-head, Drum-head, Scotch, &c. As a field crop, especially in warm climates where the vegetable will undergo a considerable diminution, the large sorts will be the most profitable. The weight of the early kinds, even under favorable circumstances, will not in general exceed from five to seven pounds each, while on favorable soils, well manured, the Ox-head, and Drum-head will produce heads weighing from ten to twenty and even thirty pounds each. The larger kinds are planted from two and a half to three feet apart.—The Drum-head and Ox-head cabbages are the varieties chiefly cultivated on the dairy farms of England, and require a clay or strong loamy soil.* An excellent location for cabbages in our country would be in newly reclaimed, marshy grounds, where they would obtain both strength and moisture. On all other soils they will require a good application of yard manure, plowed in the previous fall, and when the plants begin to head, an infusion of liquid manure between the rows will accelerate their growth and increase their size.

Care must be exercised in planting, for if done in an improper or slovenly manner it may cause a great failure in the crop. If the weather is dry at the season of planting, the roots of the plants should be plunged into a mixture of loose rich soil and water. The plants ought to be watered once or twice, if the weather continue dry, and when advanced a little, an application of liquid manure between the rows would be advisable. In England, one acre of cabbages is considered equivalent to two acres of turnip.

*Can any of your readers give any information regarding the Cæsarian cole, or Cow-cabbage? It is a perennial evergreen, and is said to grow sometimes to the height of twelve feet, and from fifteen to twenty feet in circumference. Can the seeds be procured at the Rochester Seed Stores? Have any of your readers attempted to raise it, and with what success?

A PAIR OF POLAND GEESE.

THE above engraving represents a pair of Poland Geese, a cross between the African and Chinese breeds, and one of the most approved and profitable varieties. To those who would raise geese, they present perhaps, more good points than any others. They are of good size and appearance, are easily raised, and the flesh is the best of the kind for the table. But Geese are not yet numbered among fancy Poultry.

In Great Britain the following is the usual rotation adopted by the most distinguished dairymen and cattle feeders:—When the grass begins to fail,—which there, is usually about the middle of October,—the cabbages are fed out to the end of November; from thence to the end of January the globe turnips are used—the ruta-bagas succeed to the end of March, and after these the carrots and mangolds. To the dairy farmer, and to the grazier and raisor of stock generally, a rotation of food during the winter and spring months, is as essential to the health and sound condition of animals, as a well regulated rotation of crops in a right system of husbandry. If we wonder not at the deterioration of soil, and finally its utter exhaustion, when wheat is succeeded by wheat in endless round, why should we be surprised at the dwarfishness of animals—their want of bone and muscle, when their only alternation of food is wheat straw and water to-day, and water and wheat straw to-morrow?

Animals which are badly wintered, lose, at a moderate calculation, at least four months of their growth in the year. Talk of your Devons, your Durhams, Ayreshires, Herefords, and other distinguished breeds—whence came they, and what has given them the pre-eminence they now have so justly attained? It is to the enterprising minds of such men as BAKEWELL, father and son, COLLING and others, who perceiving that moderate sized, compact, small boned animals were generally in the best condition, applied themselves to regulate the breeding in such a manner as to develop these desirable points in their stock and remove what they considered blemish.—While all this is admitted, yet we are not to lose sight of the fact, that sound, generous food is an important item in the formation of a perfect animal. It is well known that animals, the most symmetrical and of the finest breed will become deteriorated and disproportioned on unsound pasture, or coarse and scanty food. The Scotch have an old adage, to this effect:

"Its an old saying, and a true,
The cow gives all her milk by the mou." (mouth.)

There is much truth in the proverb; but, like much of current proverbial wisdom, exceptions may be taken by some in averring that some cows are so useless that, feed them as you will, their good qualities cannot be drawn forth. This is admitted; but such animals ought to be otherwise disposed of. A good cow, however, is worthy of good food; and therefore we advocate the cultivation of cabbages as a field crop, as a great auxiliary to the production of good cows, good milk, butter and cheese. Cabbages planted at the medium distance of 2½ feet will require 6,969 plants to an acre, which at the small average of 10 lbs. per head, will give about 35 tons per acre, of wholesome, nutritious food to our creatures. This surely is worthy the serious consideration of every good husbandman.

N. DAVIDSON REDPATH.

### "WHEL'S EXPERIENCE."—CLEAN SEED WHEAT.

EDS. RURAL:—I have been much amused by reading the articles which have lately appeared in the RURAL, under the head of "My Experience." They not only show how differently men will reason from the same facts, but they also show that in the examination of particular subjects, we are liable to pass by and omit noticing facts which have an important bearing upon the subject under consideration, and which, if noticed, would have led us to entirely different conclusions.

It is not my intention in this short article to attempt the disproval of these theories that the writer has labored to establish, but only to notice one point or rather a single expression which occurred in his fourth number.

The writer states that a certain field was sown to "clean seed wheat," (without taking into the account the probability that all the chess of the former crop remained in a sound state upon the ground,) and then bases the whole theory of transmutation upon the assumption that the field was sown to "clean seed wheat." Now, what kind of seed wheat was used "fifty-five years ago," I pretend not to say, but one thing is certain, and that is, that for many years past, farmers generally have been trying to clean their seed, and have made considerable progress towards the attainment of an object so desirable, and yet our wheat is far from being clean. We talk of clean seed wheat; it is a common expression, and yet who ever saw a bushel that was clean, or one that did not contain chess and other foul stuff? Few wheat growers have for the last 20 years, paid that close attention to this subject that I have, and all the various methods for cleaning seed have been practiced, and many parcels have been examined, but no clean seed have I yet seen. This examination has convinced me that few are aware of the large amount of foul seed they annually sow with their wheat.

To show to what an extent we are deceived in this matter, a few examples will be given. A neighbor came to me to buy seed to finish sowing a field, but objected to the price, saying that he had bought the rest of his seed of another for less, and "it was perfectly clean." The last statement was disputed and an examination took place which showed that each bushel of his clean seed contained more than five hundred grains of chess and cockle, in about equal proportion. Another neighbor says, "you have scolded me so much for sowing unclean wheat adjoining you, that I have been

and purchased clean seed to sow this year." This was questioned, and the result shewed that one quart contained fourteen grains of chess, or about 450 grains to the bushel.

One example more. While on a visit to Western New York a few years since, I made inquiry in several towns to find some clean wheat, or rather some that was free from red root seed, but could find none, and I only bought a peck each of two individuals. Both were famed in their own neighborhood's for raising clean wheat, and both warranted theirs to be "perfectly clean," but still each parcel contained about a dozen grains of chess and red root. This was ascertained by picking each parcel over twice by hand.

It is not necessary to multiply examples, but if 'HEEL will take a bushel of his "clean wheat" from the last in a bin, or the last from a pile on the barn floor, and spread it on a clean floor in a light place, or examine it by putting a small parcel at a time on a plate, he will find (somewhat unexpectedly, perhaps,) what will convince him that it is not fair to charge "Nature's legerdemain" with the faults that properly belong to another. LINUS CONE.

Troy, Michigan, May, 1853.

## CONDENSED CORRESPONDENCE.

### New Disease among Pigs.

MR. EDITOR:—I saw an earnest inquiry in the RURAL of May 14, from one of your correspondents concerning a disease among spring pigs. In answer, I would say that I lost a litter of five pigs last year, in March, that were diseased exactly as stated by your correspondent. In August following the same sow had a litter of eight pigs, that she reared without any trouble, which thing I mention to show that the fault was not with the mother.

This year, Feb. 26, the same sow had a litter of eight, that did well for three weeks, when I noticed that the sow was feverish, and as a matter of course, failed to a great degree in her milk. A part of the pigs became diseased, and I sought a remedy. After trying various things, to no effect, I turned her out of the pen on the wheat.—I noticed a change for the better, with the pigs in two days; and after three or four days, I shut her up, because she rooted the ground so badly. It was but a short time before the pigs looked as bad as at first, and I then put a ring in her nose and let her go. The result is, the pigs have all lived and done well, but those that were diseased the worst, are not more than one-half as large as those not diseased at all. So I come to the conclusion that the trouble was with the sow, caused by not having access to the ground and something green.—W. L., *Lewiston, N. Y.*, May, 1853.

MR. EDITOR:—I take my pen in hand to answer a communication in your paper of the 14th ult., headed "New Disease among Pigs."

In the spring of 1845, I had a sow and seven pigs, prized highly on the account of their being purely white. At the age of three or four weeks old, one died and two more became dumpish, as we call it. I communicated my ill luck to an old neighbor, saying I feared I should lose them all. He said they had the black tooth; that I must knock out their tusks, as I would find them all turned black. In the course of the second day one died, over this I held a sort of *backwoods, jack-knife, post mortem examination.* Found the throat slightly swollen, the breathing hole very much contracted, and the tusks black. There was a prospect of losing the whole of them shortly, so we got a pair of pliers, (such as are used for bending wires,) and mashed all their tusks even with the gums. The disease stopped when the third pig died.

Many died in this section the same spring, some one year old and over, but all that died were confined in tight pens. Your correspondent will only have to give his pigs free access to the earth, and take out the tusks of the sick ones, (if not too far, gone,) and his anxiety will be at an end as far as healthy pigs are concerned.—D. M., *Friendship, N. Y.*

### Security to Granaries.

MR. EDITOR:—I suppose it is not generally known that tar is very offensive to rats and mice. It is so, and acting upon this fact, I have experimented with it in building granaries. I set the bottom of the studs on which the ceiling is to be made, in from the outside boarding of the barn, about four inches, so as to give room for a cat to pass around. If the granary is in a corner of the barn, a notch should be sawed out of the post so that she can go through. I first begin with the lining to the floor; lay this first, then put on one board of the ceiling all around, and put a good coat of tar along the edge and lower ends of the boards. The floor is then laid (before putting on more ceiling, as it is more convenient cutting in the floor.) Tar is put on all around the edge, and the ceiling then finished, using tar freely at the corners. I make the door sill of a piece of hard-wood scantling, two inches by four, set up on edge.

Finished in this way, and the door *kept shut*, no rats or mice will ever get into the granary. It is seldom we see a mouse hole in a plain board; they are almost always in the corners, so use the tar there freely. I have tried this ten years, and have experienced no trouble from these pests in my granary.—H. S. HUSTED, *Le Roy, N. Y.*, May 26, 1853.

### Staking and Capping Fence.

EDS. RURAL:—The following cheap and substantial method of staking and permanently securing the common rail fence, in my opinion, takes down all others that ever came under my observation. I will try and discribe it understandingly.

First build a fence and for riders use rails or long poles, laid lengthwise, on top, in the centre of the fence, and for stakes any thing handy or convenient,—old stakes, broken rails, any sticks long enough to reach from the ground to the top of the fence will serve. Place them in the inside corner between the rider and fence; one end on the ground close to the fence, the other leaning in and wedging between the top rail and rider, and in every short corner, which secures it, fence and all, against all common levelers.

Its advantages over the common fashion, of staking, over or across the corner, and any other of the many different ways in vogue, needs neither forensic eloquence nor cunning sophistry to make it apparent to any experienced farmer, who I think will agree, that, the usual method, including cost of material and labor in sharpening and setting, will amount to nearly one half the whole expense of a fence, besides the value of land which the stakes occupy. Much might be said in favor of my favorite method, but I deem it unnecessary, and if any one can benefit himself by the above, he need not say, or feel, "*thank you*" to me, for I would be very happy to pay all I owe of such a nature in this way.—S. GRAVES, *Marcellus, N. Y.*, May 25, 1853.

### The Care of Harness—Once More.

FRIEND MOORE:—My first article, (the first I ever wrote for publication,) has called out a reply from the author of the piece I criticised, and I find a Doctor down upon me. May I say a few words in reply to his second article?

In his first, which was published in your paper of April 9th, he says:—"Take your harness to pieces as far as you can unbuckle it, put it in a tub or barrel and pour *boiling soap suds* over it, and let it stand all night." This I said would be destruction to any harness, and I say it again; boiling suds will damage any leather. He gets around it by cooling the water on its way to the barrel. We will admit that it is *possible*, that water which *has been* boiled—the tub containing the harness being at some distance, and a large quantity of cold harness being placed therein, &c.—may so reduce the temperature as to be quite harmless.

The Doctor begins to oil his harness as soon as it is cleaned, hanging it in the sun or by the fire to dry. My method is to clean and dry, hanging the harness in the shade, and then apply the oil. Look at it philosophically. If you oil a strap of leather that is full of water, it will not penetrate at all—the water must be dried away before the oil can take its place, and on clean dry leather it will strike in as soon at it touches it. Now Doctor, and all interested, try my method, and if your harness is not as pliable as his, your draft for damages shall be honored by—H., *Le Roy, N. Y.*

### Brahma Fowls.

MR. EDITOR:—A statement appeared in the Democrat of the 12th inst., of a recent sale in this city, of "improved fowls," at prices quite unusual. The same statement was published in the advertising columns of the RURAL NEW-YORKER of the 20th inst. We should not criticise this sale, had it not appeared in an Agricultural journal,—a source to which the farmer looks for correct, reliable knowledge, in regard to the character and value of the various kinds of stock and products, that come within the circle of their peculiar province.*

Three Brahma Pootras are stated to have been sold at $50 each—$150 for the three fowls. Eight Brahma hens and two pullets at $99,83, while one pair each of Cochins, Shanghais, imported white Dorkings, and Chittagongs, are sold at $5 the pair. Taking all together this sale is a remarkable one, and being thus made public, invites comment.

In the first place then, there is no intrinsic reason why three Brahmas should command the price of $50 each. The best specimens that have been brought to this city, have been purchased at $20 to $23 the pair. The most reputable Boston dealers have sent such here at $20 the pair. And in a single instance only do we learn that $35 was paid at second hand, for one such pair. One hundred dollars the pair therefore, cannot be a necessary and reasonable market price.

Again; five dollars is stated to be the price of Chittagongs, when it is now settled that most of the so styled Brahmas are nothing more than the white Chittagongs with black tails common through the entire region of the sea-board. One pair each of Cochins, Shanghais, and white imported Dorkings are also sold at $5 the pair. Now it is equally clear, that this is not the fair value of good birds of these classes. Birds, such as a professional breeder for market sales to private gentlemen, would find it necessary to possess, cannot be had for less than twice this sum at least. Cochins at $20 the pair, have recently been sent to gentlemen in this city from Boston dealers, who have also sent Brahmas at $20 the pair, at the same time.

What now must naturally be the effect of a published notice of such prices as are stated in the sale above? What, but unreasonably to enhance the supposed excellence and the cost of the Brahmas; and unduly to lessen the estimate, and the market price, of the other varieties which might be considered rivals? Brahmas sent from the East, from 8 to 18 months old, and fine as any in this market, have been sold here at ten to fifteen dollars the pair. Twenty-five dollars would be a high fancy price, for the finest pair of any variety of fowls that could be produced. Cochin Chinas, Shanghais, and white imported Dorkings, if good birds of pure blood, are worth ten dollars the pair. Those that can be bought of an extensive and professional dealer for *half* that price, must not be the stock from which to breed for sales to intelligent men.

In view of all these things, the sale, whose published notice has called forth these comments, was, to say the least of it, a curious and singular transaction. SHANGHAI.

*The statement was published as an advertisement, and not otherwise endorsed.—ED.

## AGRICULTURAL INTELLIGENCE.

### Monroe Co. Plowing Match.

THE Spring Plowing Match of our County Ag'l Society took place at Churchville on the 4th inst. The day was fine and over a thousand farmers from this and adjoining Counties were present. Nineteen teams were entered for competition, all of which performed their work in a creditable manner, rendering it difficult for the Committees to decide between them.

REPORTS OF COMMITTEES.

Class No. 1, (furrows eight by fifteen inches) is reported upon as follows:

*Premiums.*—1. Wm. Bond, Riga, Cayuga Co. Plow improved, (with Sprague's Regulator) $6; 2. J. B. Smith, do. Hallock's Trojan Plow, No. 6. $4; 3. Jas. Cannon, do. Curtis Plow, No. 12 $3; 4. Wm. Hutton do. do. $2; 5. L. Babcock, do. do. $1; 6. Augustus Outhout, Sweden. Ganson Keuka Plow, Vol. Trans; 7. Wm Swan, Lord Plow, do.

Also a special Premium of Transactions to Mr. BRINKERHOFF, Batavia, for a Self Holding Plow with two wheels connected by an axletree. The Committee thought the work of this plow not inferior to any other; it was the only one that maintained the uniform furrow required and the wheels were regarded as an improvement. It was not regularly entered, and so could not be classed with the others.

The field selected presented an uneven surface crossed by the old furrows, and the sod was a mixture of Timothy and Clover of two years standing, not stiff enough to prevent breaking in turning the furrow by plows of moderate length mould-boards.—The soil varied from a sandy to a clayey loam, the sub-soil on a portion of the field a stiff clay; on other portions small stones prevailed, both stones and clay coming near enough to the surface to be reached by the plow when guaged to the requisite depth. As the above obstacles in the way of turning a smooth, uniform furrow existed to a greater extent on some of the parcels plowed than on others, the Committee found it exceedingly difficult to decide between the claims of the different competitors.

Compared with former years the Committee are of the opinion that a fair improvment has been made, both in the skill of the plowmen and in the superiority of the plows used. And yet in a County rich in Agricultural resources as our own, and with a wheat soil unsurpassed by that of any other in the State, we ought, and with suitable encouragements might do better than we were permitted to witness on the present occasion. For the encouragement of this important branch of farm labor, the Committee would recommend that great attention in future be paid to the selection of a uniform plot of ground,—that the Society, if possible, increase its premiums—and that the award be divided equally between the plowman and the entering competitor.

ALFRED FITCH,
MOSES PETTINGILL,
P. B. HOLDRIDGE. } *Com.*

Churchville, June 4, 1853.

Class No. 2—Furrows seven by twelve inches—the Committee award the following premiums:

1. Wm. Cannon, Riga, Curtis' Plow No. 10, $6; 2. Thos. Brodie, do. Caledonia Plow, $4; 3. T. Bishop, Sweden, Eagle No. 50, $2; 4. Wm. Belch, do. do. Vol. Trans. and $1; 5. S. Fox, Brighton, Hallock's No. 21, Vol. Inst. Trans.; 6. P. Slocum, Sweden, Eagle No. 5, Vol. Inst. Trans.

A discretionary premium of $3, in addition, was given to S. Fox, of Brighton, for the most perfect compliance with the rules as to the depth and width of furrow.

EDWIN TAYLOR,
EPHRAIM KELLUM,
C. S. WHITE. } *Com.*

Class, No. 3—Boys eighteen years of age and under—received the following premiums:

1. John Sutphen, Sweden, Curtis No. 4, (iron beam.) $4; 2. D. H. Root, do. Keuka Plow $3; 3. D. Locke, do, do, $2; W. Brodie, do, Caledonia Plow, Vol. Inst. Trans. and $1.

A discretionary premium of $2 and Vol. Trans. was given to Jas. C. Ross, of Ogden, for skill and speed in Plowing.

Your Committee would report that the plowing in this class was exceedingly creditable to the boys, rendering it difficult to determine the different degrees of merit.—There was much difference in the land to be plowed, which has been taken into the account. The skill of the plowman has not been the only consideration that has determined the awards. They feel it due to W. BRODIE, to say, that had this been the case, he would have been entitled to a higher premium.

JOSEPH HARRIS.
J. G. RAMSDELL,
DUDLEY ROOT, } *Com.*

(Report on Implements, &c., next week.)

### Orleans County Plowing Match.

WE gather from the letter of a correspondent, some items of interest relating to the recent Plowing Match at Gaines, Orleans Co. There were nine competitors for the premiums, each with good teams and doing good work. Mr. Curtis had a plow there running on wheels and needing no holder, which attracted considerable attention.

Cattle, Sheep, and Horses, were well represented at the afternoon exhibition.—Among the latter was a five-year old stud, raised by Mr. DAVID HOOD and still owned by him. This horse, a son of Black Hawk, was very much admired by all who saw him, and his groom had him under the most perfect management. The occasion was generally one of much interest.

### County Agricultural Societies.

THE *Seneca* County Agricultural Society hold their next Fair and Cattle Show at Waterloo on the 12th, 13th and 14th of Oct. The following is the list of officers for 1853:

President—JOHN DELAFIELD.

Vice Presidents—Abram Rappleye, Covert; John L. Eastman, Lodi; Isaac Covert, Ovid; Peter J. Van Vleet, Romulus; O. W. Wilkinson, Varick; Robert J. Swan, Fayette; Lyman T. Crowell, Seneca Falls; Archibald Munson, Tyro; Randolph Welles, Junius; A. Schooley, Waterloo.

Treasurer—John D. Coe.

Secretary—J. W. Bacon.

THE Agricultural, Horticultural, and Mechanical Association of *Galen*, Wayne Co., will hold their annual Fair and Cattle Show, Sept. 17. Their officers for 1853, are the following:

President—Hon. L. S. KETCHUM.

Vice Presidents—A. V. Watorbury, E. Jones, Joseph C. Watson, Ezra Ringer, and J. G. Terry.

Secretary—Joseph Watson.

Treasurer—Thomas Plumtree.

Librarian—Daniel W. Foster.

THE *Maryland* State Fair is to be held at Baltimore on the 25th, 26th, 27th and 28th of October. A large number of premiums are offered.

The *Illinois* State Fair is to be held at Springfield, on the 12th, 13th and 14th of October.

TRANSPLANTING EVERGREENS.—We have seen different times recommended for transplanting Evergreens—some saying it should be done in the fall, others in the spring, &c. When set in the fall they will die universally, while few will live when put out early in the spring. The first half of June is the best time, and if carefully and judiciously performed then, not one in twenty will die. We do not remember a single failure in all our experience. A large wheel-barrow load of swamp muck filled in around the roots of each tree, is very beneficial.—S. W., *Whalenville, N. Y.*, June, 1853.

## THE AGRICULTURAL PRESS.

### When to Use Lime and Plaster.

WE find the subjoined explanation of the use and action of Lime and Gypsum unredited in an exchange:

The value of lime or plaster, as a manure, depends upon the component parts of the soil to which it is applied. All land has more or less sulphuric acid in it, caused by the decomposition of *iron pyrites*. The presence of this acid may generally be known by the appearance of the soil, particularly of the stones. If there is any iron rust, or *oxide* of *iron*, in the soil, or in the stones, or on the top of the water that filtrates through the soil, or if the water is *hard*, it indicates the presence of sulphuric acid.

If land on which grass seed is sown is "slow to catch" or sod over, or catches in *patches*, it indicates the presence of sulphuric acid. If the roots of clover and herdsgrass in the spring stand two or three inches out of the ground, and in detached parcels, with bare ground between, it is the work of sulphuric acid. On such land plaster is a positive injury. If clover and tame grasses die out, and are succeeded by *wire grass*, sorrel or sour dock, it is caused by sulphuric acid. Put on lime and keep off plaster.

The reason why plaster should not be used on land charged with sulphuric acid is, that plaster is composed of lime and sulphur, and applying that is adding more of that with which land is already overcharged. On such land apply *lime*, which unites with the sulphuric acid, and forms plaster. The lime thus neutralizes the acid; and the acid thus neutralizes the lime, and form a compound nutriment for vegetation. The reason why the ground appears so hard where the earth is charged with sulphuric acid is, that the old stubble has been *eaten up* by the acid.

The sulphuric acid in plaster, applied to land not overcharged with that substance, *decomposes* vegetation, and fits it for nourishing the living plants. When there is an excess of the acid, it *eats up* the vegetation, both death and living. This is the reason why soils overcharged with the acid are always deficient in vegetable matter. And soils free from it have an excess of vegetable matter in a non-decomposed state.

The presence of this acid is the cause of sorrel and sour grass. The land is literally sour, and Nature is trying to throw it from her stomach, through these excrescences.—The rule then is, if your land has too much sulphuric acid, *or is sour*, give it a good coat of lime; if destitute of acid, apply plaster.

### Have we Heavy-Wooled Sheep Among us?

THE Bourbon question has not excited more general interest throughout the country than has that discussed in the following article, which we copy from the *Wool Grower and Stock Register*, for June:

THE Bourbon humbug is not more bold and transparent, than is the claim set up by sundry breeders of exclusively heavy-fleeced sheep. Unfortunately, however, the sheep humbug has done, and is doing, infinitely more mischief than its Bourbon brother. That is, at least, a harmless subject for gossip among the credulous or curious. But the other has scattered the seeds of disappointment and distrust among a large number of people, and will destroy beyond all hope many a valuable flock of sheep, and seriously injure a great number of others. Cupidity and avarice may be successful with ignorance for a time, but in the end they will get their reward. A few men in this State and in Vermont have made fortunes by pushing the fraud,—and probably they will continue to do so, for the world likes to be humbugged, and nobody better than a certain class of farmers.

Any man can have heavy-fleeced sheep, without going to Vermont or Connecticut, or France or Germany. And I will tell him how he can do it, and how it is done. One way is to shear very early one year and very late another. That is the first degree,—a small bug. The next degree improves upon the first by washing early, and not very clean; or, to give the words of rather a celebrated Vermont breeder to his men when washing, they wash "the hind legs"—leaving all forward wet, but not washed. The sheep are driven through dusty roads, and run till late in bare fields, or around sand or gravel banks. This is the second degree, and it will give some very heavy fleeces of (*washed?*) wool. The bug has grown some.

The next degree takes the same kind of sheep. They are fed high while lambs, higher when yearlings, and, if not sold, highest when two years old—so that in the third year you shall have a large sheep and a very heavy fleece. A part of the first degree is adopted in this. The sheep is shorn early and not very closely. The next year, which is to give the heavy fleece, that is to be put in all the papers, it will be shorn late, and unwashed. The sheep will be kept under cover, the body well smeared at shearing with about three pounds of tar, tallow and lamp oil, litherage or lamp-black; it will be well oiled at various times during the winter. At shearing time there will be a heavy-fleeced sheep among us. And men who have just concluded to go into the sheep business will go a great ways to get some of that kind of sheep, and will pay high prices for them. The bug thus attains its growth.

Now, in the hands of most farmers, these sheep would have yielded, with the ordinary care and keeping, from 3 to 5 lbs. of clean washed wool. The rams would have sheared about 8 lbs.—averaging from 6 to 10 lbs.

I have been much amused by the inquiries of many correspondents in regard to my own sheep which I offered for sale last fall, (but which, I will remark in passing, were not sold and have been withdrawn from market—the demand for rams

being so much better than I expected, it is no object to sell my ewes.) And I have been as much instructed, for no two had the same notions as to what would meet their views, except heavy fleeces. On that all agreed,—purity of blood being of less consequence than heavy fleeces.

The plan adopted by the State Agricultural Society will thoroughly test the heavy-fleece humbug, and we shall be likely to know, in due time, about how much wool, and how much dirt and grease, goes to make a heavy-wooled sheep.—R.

THE following items are from the same source as the preceding:

### Mr. McHardy's Stock.—Raising Calves.

MR. MOORE:—I am a subscriber to the RURAL NEW-YORKER, and the WOOL GROWER, and find many pieces in these papers which interest me much. This induces me to send you a short sketch of my stock and of my way of raising calves.

In my judgment, after looking the country over, the short-horn Durhams are the most profitable cattle. Hence I tried them, and my experience confirms this belief. I have a grade of cattle which I esteem very highly, and think they are able to compete with any class in America. They are a cross between the Short-horns and the imported Holland; they are varied in color, including all the colors of the Short-horns and of the Dutch, being black, blue and spotted. My stock numbers in all about forty, several good thorough bred Short-horns among them. I wish some of our stock men—good judges of cattle, would call and see mine, and be frank to let me know whether I am doing right or wrong, as I am a beginner.

I had the curiosity to weigh four head the 27th of last month. They were in fair store condition, and weighed as follows:

| | |
|---|---|
| Bull, "Major," Short-horn, | 2350 lbs. |
| Cow, "Lady Barrington," do., imported, | 1468 " |
| " "Lady Mar," grade, | 1180 " |
| Calf, "Bouncing Betsey," do., 13 mo. 5 d. old, | 1020 " |

I should like to know where I could see a heifer of the same age which would weigh as much.

I have, I think, a good and cheap way of raising calves. I let them suck but once or twice and feed new milk till one month old. I then commence mixing skim-milk, warmed with new milk, while I take oil meal and middlings one-half each, and put in a little at first, and increase as I think they need, say from a gill to a pint each. I think my calves do not cost me over one cent per day, or the price of half a pound of butter per week—besides the skimmed milk they ought to have I am now raising twelve calves; they look well, and last year I had good success in this way, and took premiums at our town and county Fairs over calves fed on new milk. I might sell my bull, Major, if a purchaser desired him.

D. MCHARDY.

*West Rush, N. Y., May, 1853.*

### Herefords.—Virginia State Fair.

THE following letter from the Secretary of the Va. State Ag. Society to Mr. WM. H. SOTHAM, of Piffard, N. Y., has been furnished for publication in the Stock Register:

SHADWELL, Albemarle Co., Va., May, 1853.

SIR:—You will perceive by a schedule which I shall have sent to you in a few days, that the Virginia State Agricultural Society rates Herefords and Short-horns together, and offers its premiums for them in *one class*. I had this done that the two might fairly compete. Our premiums for the two classes amount to $195. The Fair will be held probably at Richmond, *certainly at an accessible point*, the week after the Baltimore Fair.

You can, if you please, (indeed I wish you would,) make it generally known at the North that Herefords and Short-horns can fairly compete at the Fair of the Virginia State Ag. Society.

Respectfully, FRANK G. RUFFIN,
Cor. Sec'y Va. State Ag. Soc.

### How to Catch a Sheep.

IN catching sheep, never seize them by the wool on the back, as it hurts them exceedingly, and has in some cases been known to kill them, particularly in hot weather, if they are large and fat. Indeed the best way is to avoid the wool altogether, and to accustom yourself to take them by the hind leg, or what is better, by the neck, placing one hand under the jaws, and the other at the back of the ears, when by lifting up the head, a child may hold almost any sheep. But much depends on how a flock is treated. Few people are sufficiently gentle with sheep. In Maryland, and south of it, sheep are rarely approached near enough to touch or catch them, except as farmers are themselves treated, in all countries, and alike by tyrants and demagogues, when they are to be *sheared or slaughtered*.

By kind and gentle usage, and occasional salting, a man may have his sheep so tame that he may play with them, as every man that has a heart will sometimes do with his dog. At any rate the feeling and thoughtful farmer, will never suffer his sheep, or any thing else under his guardianship, to be unnecessarily terrified or otherwise ill treated.

### Review of Wool Market for May, 1853

BY the last advices from Australia it appears that the clip from that golden region will come forward in larger quantity than was at first anticipated. An attempt will be made to take advantage of this fact to depress prices for our coming clip. There ought to be no such effect produced. At best there will not be sufficient wool to sensibly affect prices in England. On the contrary high prices must rule, both there and in Germany, for the finer grades; and at any material decline here, our best wools would be taken for the English market. Good prices will therefore continue through the season. Western wool has been nearly all contracted at prices ranging from 50 to 75c.

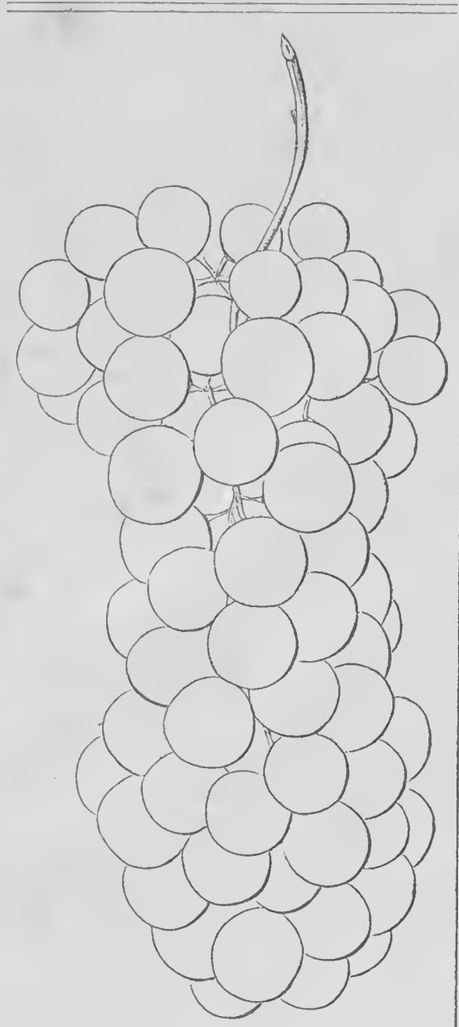
# Orchard and Garden.



THE CLINTON GRAPE.

I HAVE before me (January 25th) a bunch of the above desirable, long-keeping variety, as fresh and perfect as it came from the vine. It has been cultivated in the vicinity of Rochester for the last twenty or twenty-five years; yet it is still but little known, although well worthy of a more general cultivation on account of its hardiness and productiveness. It is *the* grape for the North, where no other variety ripens. Even with us, (latitude 42°,) in backward seasons this is the only variety that attains complete maturity. I would particularly recommend it to wine-makers as worthy of trial. My opinion is, that before many years it will be extensively cultivated as a wine grape. Judging from the character of its juice, the wine will require a longer time to ripen than that of *Isabella* and *Catawba*, and will keep much longer than either. It succeeds well in all dry situations, and is entirely free from *rot*, to which the *Catawba* is particularly subject.

It is a matter of surprise that the wine-makers of the West, some of whom have been making such active search for native grapes, have not turned their attention to this variety. I have not seen it mentioned in any of their reports. I am informed, however, that it is now in the course of being tested there, and that a quantity of the grapes have been sent from this place to an eminent wine-maker, to be tested as to their wine-producing qualities. We may, therefore, expect a report soon.

The vine grows rapidly, and is propagated easily, striking more readily from cuttings than any other variety I know in the whole catalogue of popular native and foreign sorts. The shoots are slender and wirey, ripening so well as to acquire great firmness, and hence it is so hardy that the severe cold of a northern winter never affects even the softs parts of the young shoots.

Wood—grayish brown, and short-jointed. Leaves—small and thin, sharply serrated, and unlike *Isabella* and *Catawba*, which are usually turned backwards, they have more of a concave form. Bunches—small and compact, resembling much the *Black Cluster*. Berries—small to medium, black, juicy, with considerable pulp, rather acid when first gathered even though ripe. They improve by keeping, just as winter pears will by house-ripening. It is a prodigious bearer, and ripens in equal situations to two or three weeks before the *Isabella*.—G. E., *in Horticulturist*.

### THINNING OUT VEGETABLES.

IT was Cobbitt, we think, that remarked, when speaking of the ill-effect of thick planting, that one cucumber plant in a hill would bear more fruit than two, two more than four and so on, and if there were fifty plants in a hill, the whole of them put together bear no cucumbers at all! The truth is, there is a much greater loss in allowing vegetables to stand thickly together, than most are at all aware of. To insure a crop plenty of seed is sown, with the intention of thinning at the proper time; but when thinning day arrives, it requires rather more nerve to commit what appears to be the merciless havoc of tearing out nine-tenths of the beautifully growing young plants, than most people possess. A crop of beets has just commenced forming handsome bulbs, precisely one inch asunder in the row; certainly something of the surgeon's temper is needed to lay nine-tenths of these withering in the sun—cucumbers are just beginning to throw out their yellow blossoms, and it seems to some a hard matter to tear out three-fourths of the dozen now growing in the hill. It must however be done—all the surplus plants in a bed of beets or turneps, or a hill of cucumbers, squashes or melons, are to be regarded as so many positive, downright *weeds*, obstructing the growth of the rest and yielding but little or nothing themselves. If our crops are to be crowded and stunted, we would quite as willingly have it done with pig-weeds and fox-tail, as to have them smothered and the soil exhausted by seeds of their own species.

Many years ago, when the cultivation of the rutabaga was first introduced, we could invariably distinguish the crops of the novice, by the thickly growing, half-developed bulbs. "O! but they had thinned them to a very great extent—they had cut out three-fourths, and reduced them from one inch to four inches in distance," whereas none should ever stand nearer than a foot to each other, if the soil possesses any thing like a fair degree of fertility; but this looked too much like indiscriminate slaughter, and could not be thought of for a moment.—The finest specimens of garden products, which we see exhibited at horticultural shows, are those which have been well thinned and allowed every opportunity to develop themselves freely; and the same is true of ornamental plants, where a full, rich, and luxuriant growth and bloom, are obtained through the adoption of the same principle.—*Country Gentleman.*

### THE LEAF ROLLERS.

WITHIN a few years the cultivators of fruit in this vicinity have had their attention attracted to a new enemy, which is highly injurious to the young pear trees. It is an insect in the shape of a worm of the color of the leaf, which about the middle of May commences its depredations on the young leaf, sometimes beginning in the centre, perforating it, and rapidly extending its ravages in every direction, and increasing in size and voracity from day to day. The holes thus made in the leaf soon reach a diameter of an inch or more, and where two or three are attached to one leaf, it soon disappears. The foliage of the tree is thus rendered unsightly, and the tree, of course, must be more or less injured. Sometimes, although rarely, this insect attacks the young and tender fruit, which of course is at once destroyed. This insect is more numerous this season than usual, and if some means are not discovered to reduce the number, in a few years it may become as great a pest to the pear trees as the canker worm is to the apple trees. It has been suggested that the application of whale oil soap by means of a syringe would be beneficial—at any rate it is worth the trial.

We have consulted Dr. Harris's valuable work on Insects, in relation to the character and habits of this worm, and we find it is some rascal that is so often found rolling up the extremities of the young and tender leaves of pear trees and occasionally apple trees, and belongs to the family of "leaf rollers." The following is the description as given by Dr. Harris:

"There are many caterpillars that curl up the edges of the leaves of plants into little cylindrical rolls, open at each end, and fastened together with bands or threads of silk. These rolls serve at once for the habitations and the food of the insects; and to the latter Linnæus gave the name of Tortrices, derived from a Latin word signifying to curl or twist. All the caterpillars now put in this tribe are not leaf-rollers. Some of them live in leaf and flower buds, and fasten the leaves together so that the bud cannot open, while they devour the tender substance within. Some live in a kind of tent formed of several leaves, drawn together and secured with silken threads. Others are found in the tender shoots or under the bark of plants. A few bore into young fruits, which they cause to ripen and fall prematurely. *A still smaller number of kinds live on the leaves of plants, exposed to view, and without any kind of covering over them.* Most of these insects, when disturbed, let themselves down by threads, like the Geometers. Very few of them make cocoons; the greater number transforming within the rolled leaves, or in the other situations wherein they usually dwell. They are furnished with sixteen legs, and their bodies are nearly or quite naked. Many of their chrysalids have two rows of minute prickles across each of the rings of the hind body, by the help of which they push themselves half way out of their habitations, when the included moths are about to come forth.

The moths of this tribe are mostly of small size, very few of them expanding more than one inch. They carry their wings like a steep roof over their bodies when they are at rest. Their fore wings are very much curved, and are very broad at the shoulders, and hence these insects are called *Plutyomides*, that is, broad shoulders, by the French naturalists. These wings are generally very prettily banded and spotted, and are sometimes ornamented with brilliant metallic spots. The hind wings are plain, and of a uniform dusky or grayish color, and the inner edge is folded like a fan against the side of the body. Their antennæ are naked or threadlike. Their feelers, two in number, are broad, of moderate length, or project like a short beak in front of the head, and are never curved upwards. The spiral tongue is mostly short and sometimes invisible. The body is rather short and thick, and the legs are also much shorter in proportion than in Deltamoths. These little moths fly only in the evening and remain at rest during the day upon or near the plants inhabited by their caterpillars.—They are most abundant in midsummer, but certain species appear in the spring or autumn. The habits of the Tortrices, in all their states, are not yet known well enough to enable us to group the insects together under family names."—*Boston Journal.*

PINCHING off the tips of the most luxuriant shoots with the thumb and finger causes many plants to grow stocky and become covered with dense foliage and flowers.—A little attention soon makes the operator expert in this process, which is far superior to using the knife in any way.

# Mechanic Arts, &c.

### LIST OF PATENT CLAIMS

ISSUED FROM THE UNITED STATES PATENT OFFICE
For the week ending May 31, 1853.

Duncan E. McDougall, of Troy, N. Y., for improved door fasteners.

Philip H. Keck, of Morgantown, Va., for improvement in cultivators.

Richard H. Middleton, of Alexandria, Va., for improvement in compound rails.

Charles Neer, of Troy, N. Y., for improvement in fire places and stoves.

Marie Louise Roucout, of Paris, France, for improvement in grate bars. Patented in France, Sept. 10, 1851.

Arnold Buffum, of New York, N. Y., assignor to John D. Lynde, of same place, for improved gold washer and amalgamator.

Wm. H. Jennison, of New York, N. Y., assignor to Chas. Millington (now deceased) and John Jordon, of same place, and said Millington, executrix and executor, and said Jordon, assignors to James M. Parker, of New York, aforesaid, for improvement in compositions for a filter.

DESIGN.

Anthony J. Gallagher and John J. Baker, of Philadelphia, Pa., for design for a cooking stove.

### NEW TANNING PROCESS.

WE learn by the "London Mechanics' Magazine" that a new patent process, named "Prellers," has lately found much favor in London. After the hides or skins are unhaired in the usual manner, they undergo a partial drying, and receive a uniform coating of a peculiar paste composed of various vegetable and saline substances. The vegetable substances employed contain a large proportion of starch, such as barley, rice, or wheat flour, a little gluten, some butter, or oil and grease, some common salt, and some saltpetre. The hides are laid upon tables and smeared on the fleshy side, with the said paste, and in that state are put into the interior of large drums, which receive a rotary motion, and by which the hides are greatly agitated, and the paste (by pegs in the inside of the drums,) is forced into the pores of the hides or skins, or rather they are knoaded along with the paste for two or three hours, after which they are drawn out. They are then found to be in a partial dry state, then hung up and aired for two hours, and again laid upon the table, where they receive another dose of the same paste, and are again returned to the drums a second time, when the same operation as that described is again performed. After this they receive a third smearing with the paste, and are kneaded in the drums, after which they are taken out and hung up to dry, and are then fit for the currying process. The leather thus produced is stated to be much lighter than that produced by oak or other tan barks, but is much stronger and will wear much better. It is asserted that for machinery bands it is twice as strong as oak-tanned leather, and that sheep and goat skins are rendered very tough and durable. It is said that calf skins are tanned by this process in about three hours, and the thickest ox-hide in three days.

We are not aware that any such process for tanning is described in any work on the subject, or has been practiced in our country. It is our opinion that it may make excellent uppers for boots and shoes, but not so good sole leather as oak bark. It is stated that the brains of animals is also used in the paste, and that the salt and nitre are only employed to preserve the animal and greasy matters from putrefaction. The process has some resemblance to that employed by many tribes of our Indians for tanning their skins for moccasins and other purposes. They use the brains of animals, mixed with lye made of the wood ashes of their fires, and knead the skins and rub them with the pasty mass, upon the same principle as that employed in the "Preller process." When the tanning of the skins is completed according to their notions, they are finished by drying them, or rather smoking them, in a pit in the ground, which is covered with bark and some earth. We have seen very good brown leather made by this process. We are not able to give the exact proportions of the paste used by Preller, but this does not make much matter, for some of our tanners can surely make up a paste with flour, or brains, and oil or grease, &c., and give it a fair trial, by kneading a skin or two in a tub, with a beetle so as to test the principle of the process.—There is nothing like giving every theory (unless it is manifestly absurb) which is set forth as an improvement, a fair trial, and this is the reason why we have presented the foregoing information, in order that it may be tested by some of our tanners to see whether it has any merit or not.—*Scientific American.*

### BRONZE STATUE OF CLINTON.

A VERY fine bronze statue of De Witt Clinton has been on exhibition at our City Hall during the past week. It was continually surrounded with a crowd of admirers from the moment it was erected on its pedestal. The statue is 10½ feet high and the pedestal 8½, making the altitude 19 feet.—The artist is H. K. Brown, of Brooklyn, N. Y., who has done honor to himself and the art by this noble work. We do not like to see huge statues on low pedestals, but this work is so majestic, there is so much spirit in the whole, the face being truly fine—so much thought and genius sitting on the brow, fire in the eye, and bold determination in the firm compressed lips, that it at once commands and rivets admiration. The dress is the old-fashioned short clothes—knee-breeches, long stockings, and slippers, with the folds of a mantle gracefully swelling around it.

The casting was done at Ames' foundry at Chicopee, Mass., and does credit to those engaged in the minor manipulations. We wish that our citizens would erect such a statue to Robert Fulton; we like such testimonials to the memory of departed worthies far better than tall shafts or huge piles of masonry. This work to the memory of Clinton, we believe, is strictly private; this is no credit to the people of this State, nor this great city, which has been so greatly benefited by that work of which he was the chief promotor—the Erie Canal, which united the Atlantic Ocean and Lake Erie together. It was hoped by many that the people of this State, or those of Albany city, would have at one time erected a public monument over his grave, but there did not appear to be enough of spirit or gratitude in the people to do this: hence his remains were removed by his relatives, a few years ago, and interred in Greenwood, in the family burial plot, where this noble work of H. K. Brown's genius is to be erected, and which will remain for centuries to let future generations know where De Witt Clinton sleeps.—*Sci. American.*

### TRICKS UPON THE TELEGRAPH.

THE lightning, which it is claimed has been subdued and tamed, and is so manageable that, under proper training, it is made to write so that those familiar with its language may read, by the music of its voice, and without the aid of the eye—often plays queer pranks with the medium of communication as well as mystifies the operators themselves. Not untrequently it takes the reins in its own hands, and instead of allowing outsiders to manage, and dictate what shall be written, places all sorts of impediments in the way—interrupts, blots out, interlines, and renders the communication intended to be sent entirely unintelligible.—Then, again, the posts along the line are not constructed to its fancy, or the wires are not placed to its inclination. Without communicating its intention to its subordinates or requesting a consultation, it forthwith prostrates the posts and hangs the wire on the fence.

If, by inadvertance, the wires of competing lines are suspended across each other at improper intervals, a sort of jealousy seems to be aroused, and advantage is taken of the first storm to drop one upon the other.

A freak of this kind was played yesterday by the master-wind to the annoyance of the operators on both lines. The Morse operators, instead of receiving the usually distinct characters so familiar to them, were made to receive the Dutch of the House line. Rat-tat-tat—tree-tree, came bounding into the office as unceremoniously as a train of cars through a draw-bridge; while the House operators were equally annoyed to find the Greek of the Morse alphabet, with its tic-tic-tic-ti-ti—assuming the place of their legible A B C's.

The sport did not last long. A messenger was despatched to adjust the wires, but before he reached the locality a train of cars rushed by, whistled at the confusion of the wires, sent its hoarse voice closing with a screech, into the rooms of both operators, causing a regular stampede, and adjusting the wires with its breath. The yell of the locomotive was *supposed* to come by the wires, though possibly the train was not far off.—*Argus.*

NEW COMPOUND RAIL.—A new rail for roads has been invented by WELLS and SERRILL. It is compound, consists of an interior and exterior rail, so arranged that the joints are broken, that is, that the parts lap over one annother. No rivets or bolts are used, and an ordinary workman can lay of repair it. The rail may be used with or without chairs. When the exterior rail is worn out it can be renewed, while at least two-fifths of the entire bar which is not subject to wear, is saved. It will be patented. The plan strikes us as a good thing, and is at least worth the attention of railroad men.

# Domestic Economy.

CURE FOR TOOTHACHE.—Mr. James Batson, of Airdrie, says;

"Gum Copal, when dissolved in chloroform, forms an excellent compound for stuffing the holes of decayed teeth. I have used it frequently, and the benefits my patients have derived from it have been truly astonishing. The application is simple and easy. I clean out the hole, and moisten a little piece of cotton with the solution; I introduce this into the decayed part, and in every instance the relief has been almost instantaneous. The chloroform removes the pain, and the gum copal resists the action of the saliva; and as the application is so agreeable, those who may labor under this dreadful malady would do well to make a trial of it."

INDIAN MEAL DOUGH NUTS.—A tea-cup and a half of boiling milk, poured on two tea-cups of sifted Indian meal. When it is cool add two tea-cups of wheat flour, one tea-cup of butter, one and a half of sugar, one of yeast, and two eggs, with a tablespoonful of cinnamon or a grated nutmeg. If not sufficiently stiff, add equal portions of wheat and Indian meal. Let it rise very light. Roll it about half an inch thick, and cut it into small diamond-shaped cakes, and boil them in lard

INDIAN MEAL SHORT CAKES.—Stir into a pint of sweet milk three well-beaten eggs; add a little salt, and a half a cup of butter, with enough sifted Indian meal to make a thick batter. Drop it from a large spoon upon buttered tins. Bake them in a quick oven. When they are lightly browned they are done. Send them to table hot and eat with butter.

# Educational.

For the Rural New-Yorker.

## TEACH YOUR CHILDREN KINDNESS.

Parents, as well as children, are often guilty of wrong and cruelty to the animal creation, for which they can offer no other excuse than the gratification of *self*. If we would have kind and humane children, let us, who are parents set an example worthy to be followed. If children have the right examples set before them, and are taught to be kind and feeling to the animal creation while they are young, it is seldom the case they will grow up with unfeeling and cruel dispositions. The boy that has been suffered to cruelize and destroy the feathered tribe, because he found sport in it, and that too without any just rebukes from his parents, is apt to care little for the pain he gives others, even after he has grown up.—The more a boy is allowed to indulge in the cruel sport of destroying the innocent creatures God has made, the more hardened does he become, and the less does he think of the cruelty he is practising. The dying struggles of the robin do not touch his heart, because they have become common and of every day occurrence.

It is the duty of parents, to early impress upon the minds of their children, the feeling of love and kindness they should have towards God's creatures. If the right feelings are implanted, and good examples set before children, small would be the number (in comparison to what it now is,) of boys who would be sauntering forth with their guns, to shoot down the little winged creatures that make glad music in our fields and groves. But instead of parents discountenancing such acts of cruelty, quite many *encourage* them,—for often is it the case, that the father will take his little son (of not more than ten summers, perhaps,) to the woods and fields, and thus set the example with his own hand of shooting down, in cool blood, some harmless little sparrow or blue-bird, thus allowing his little boy the gratification of witnessing his father's deeds of *daring*.

If we trace back this father's history to his boyhood, ten chances to one, if he was not taken to the woods in the same manner by his father, and thus learned and continued such a practice till we see him training his children in the same way. It is a natural consequence for boys to delight in guning, and if allowed to take their own course, and led on withal, by their father, a majority of them will spend a good part of their time in "cruel sporting;"—a practice shocking in the extreme. A reformation is certainly needed; and in many States there are laws enacted for the protection of the feathered race, &c., which have done considerable towards saving the lives of such creatures as the laws aim to protect; but however stringent such laws may be, they will not have much effect upon the *disposition* of *lawless* boys. Parents can, if they will, do a vast deal more towards effecting a desired reformation, than any prohibitory laws. The example and precept of parents are of essential importance; and the wrongs and cruelties should be pictured to the minds of children in such a way that they will have no desire to take the life of any creature that is harmless to man. If this were done, a law would be already engraven upon the heart, that could have no equal on the statute book. Let parents try the experiment; and my word for it, a different feeling will soon be manifested towards the animal creation. A. Todd.

Smithfield, R. I., 4th mo., 1853.

## RESPONSIBILITY OF EDUCATORS.

How many of our readers appreciate properly the responsibility of the position they occupy in society? We do not mean legal, but moral responsibility: responsibility to society, to their country, and to their Creator. We fear too many do not appreciate it as they should.

The intimate relation they sustain to the children and youth of their charge; and the facilities afforded by daily intercourse for securing their affections and sympathies, give them a power to control and give direction to their forming character for good or for evil with an effect to an extent greater by far than any other class with whom they have to do. Every act, every word, makes its impression, and often with a permanency never to be effaced; but how many, alas, appear to be wholly unconscious of the influence their conduct, their habits and their manners are daily and hourly exerting upon the groups of youthful imitators around them, and seem to feel as if acts, once passed, were obliterated and all traces of them lost forever. But the memory of the child is an imperishable record that is read and re-read even to the last stages of second childhood; and the early moral impressions made upon it are as lasting as if engraven upon adamant, giving tone to character, and not unfrequently marking, or debasing the future man.

Who, then, can estimate to what extent the influence of teachers is directly instrumental in giving bias and direction to the character of the future man?—and how many of our instructors estimate fully the responsibility of a position that necessarily gives them such an influence? Do they weigh and appreciate it as they ought?

We have often thought a characteristic distinction between teachers and school-keepers was observable in the fact that the former, because interested in the well-being of their charge, feel the responsibility resting upon them in the work of expanding and giving direction to the intellectual and moral powers of the young, while the latter, from sheer indifference, practically repudiate all accountability.

A due sense of responsibility in the teacher is among the most fruitful sources of success, while the want of it will as often prove a cause of failure. We have observed that our most successful teachers are always most deeply interested in whatever relates to, or in any way affects, their duties, or the interests of those under their instruction; whereas our drones are ever ready on gossip of a trivial and frivolous character, and the more irrelative and foreign from professional topics the better. We have often marked the distinction, and could give, in illustration living examples of the two classes; some of which, although indicating a lamentably low degree of mental development, and of moral culture and sensibility, could but appear ludicrous in the extreme. —*Me. Journal of Education.*

## THE PEOPLES' COLLEGE.

The Trustees named in the Legislative act incorporating this College held their first meeting at Oswego, Tioga Co., on Wednesday, and elected D. C. Mc Callum, of Owego, President. J. Wynkoop, of Chemung, Vice President; Tracy Morgan, of Binghampton, Treasurer; Harrison Howard of Lockport, Secretary and General Agent. Arrangements were made for an appeal through the Public Press to the friends of Practical Education throughout the State for subscriptions to the stock, and strong hopes were expressed that the success of such appeal would enable the Trustees to call a Stockholders' meeting preparatory to the location of the College before the close of the year. So far as the plan has been commended to the laboring class and those allied to them by birth, training, and sympathy, it has met with unbroken favor. The General Agent solicits communications and suggestions from all who are interested in the idea, and will gladly send a pamphlet containing the act of incorporation and an outline of the course of Study and Labor contemplated to each person whose name may be forwarded him for the purpose.

The People's College is not the purely Agricultural seminary for which a charter was obtained by John Delafield and others at the last Session. That seminary will doubtless do much good, when established, in diffusing a knowledge of the principles and methods of Agriculture among the sons of gentlemen; but the People's College meditates a far wider field of usefulness.—By not merely *providing* labor, but by absolutely *requiring* the devotion of some hours weekly to Manual Toil from every pupil not only but every teacher as well, it aims to secure efficiency in Industry and a just pride in its prosecution and results as the public or corporate sentiment of the College, thence diffusing and awakening that pride throughout the country. Work being the inexorable condition on which the privileges of the institution are accorded, thousands will be brought to recognize its intrinsic nobleness, who would regard it with far different emotions while it remained a badge of depression and servitude. Then there are hundreds of youth who need and earnestly desire a better education than our Common Schools afford, yet who are debarred by poverty and friendlessness from obtaining it under the old system. To these the People's College virtually says, "Earn a few dollars and acquire some aptitude for Labor on any farm, in any workshop, then come here and use your own muscles a few hours of each secular day to earn your own food, clothing and tuition, and so work your way through College, and graduate a ripe student and a skillful farmer, mechanic, or both." Such is the "being's end and aim" of this College—to blend Intellectual Culture with manual Skill, and graduate hundreds annually who are alike qualified to lead as Farmers and Mechanics, or to serve as Teachers. Physicians, &c., &c. Such a College, for a few years in full operation, could not fail to elevate the standard of capacity and efficiency in most Industrial callings by recruiting their ranks with men more intelligent and better grounded in the principles and laws which underlie their several pursuits than the mass of our Mechanics, while educated as at present, ever can be. Not students only, but the whole class to which they belong, will be elevated and profited by by the operation of the People's College.

There is liberality and public spirit in the State sufficient to endow such an institution within the current year. It can only fail through apathy, inattention, ignorance, or want of faith in each other among its friends. If the plan could be this day expounded to every citizen of the State, and each exhorted to aid it according to his ability and conviction of its merits, there would be enough money subscribed before long to ensure the success of the enterprise. Reader! consider yourself specially invited and urged to do what you can for the People's College!—*New York Tribune.*

That was a good remark of Seneca's when he said—"Great is he who enjoys his earthenware as if it were plate; and not less great is the man to whom all his plate is no more than earthenware."

Every vice fights against nature.

THE PEREGRINE FALCON.

The courage, power, docility and swiftness of the peregrine falcon rendered it a favorite in the days of falconry. The game at which it was flown were herons, cranes, wild ducks, &c., which it took by soaring above, and then, making its sweep, that is, darting down impetuously upon them, bore them with irresistible violence to the earth. The appearance of this hawk excites universal panic among the water-fowl. A notorious characteristic of the species is, that at the report of a gun it will sometimes come and carry off, from within thirty yards of the sportsman, a bird which he may have just shot, with an assurance as surprising as unexpected.

The following anecdote will prove the enduring attachment of which this creature is capable. The late Colonel Johnson, says a recent writer, was ordered to Canada with his battalion, and being very fond of falconry, to which he had devoted much time and expense, he took with him two of his favorite peregrines, as his companions across the Atlantic. It was his constant habit during the voyage to allow them to fly every day, after "feeding them up," that they might not be induced to rake off after a passing sea-gull, or wander out of sight of the vessel. Sometimes their rambles were very wide and protracted; at others they would ascend to such a height as to be almost lost to the view of the passengers, who soon found them to be an effectual means of relieving the tedium of a long sea-voyage, and naturally took a lively interest in their welfare; but, as they were in the habit of returning regularly to the ship, no uneasiness was felt during their occasional absence.—At last, one evening, after a longer flight than usual, one of the falcons returned alone. The other—the prime favorite—was missing. Day after day passed away, and, however much he may have continued to regret his loss, Captain Johnson had at length made up his mind that it was irretrievable, and that he should never see him again.

Soon after the arrival of the regiment in America, on casting his eyes over a Halifax newspaper, he was struck by a paragraph announcing that the Captain of an American schooner had at that moment in his possession a fine hawk, which had suddenly made its appearance on board his ship during his passage from Liverpool. The idea at once occurred to Captain Johnson that this could be no other than his much-prized falcon; so, having obtained immediate leave of absence, he set out for Halifax, a journey of some days. On arrival, he lost no time in waiting on the commander of the schooner, announcing the object of his journey, and requesting that he might be allowed to see the bird; but the American had no idea of relinquishing his prize so easily, and steutly refused to admit of the interview, "guessing" that it was very easy for an Englishman to lay claim to another man's property, but "calculating" that it was a great deal harder for him to get possession of it; and concluded by asserting in unqualified terms his entire disbelief in the whole story. Captain Johnson, whose object, however, was rather to recover his falcon than to pick a quarrel with the American, proposed that his claim to the ownership of the bird should be decided by an experiment, which several Americans who were present admitted to be perfectly reasonable, and in which their countryman was at last persuaded to acquiesce.

It was this:—Captain Johnson was to be admitted to an interview with the hawk—who, by the way, had as yet shown no particular partiality for any person since her arrival in the New World, but, on the contrary, had rather repelled all attempts at familiarity—and if at this meeting she should not only exhibit such unequivocal signs of attachment and recognition as should induce the majority of the bystanders to believe that he really was her original master, but, especially, if she should play with the buttons of his coat, then the American was at once to waive all claim to her. The American went up-stairs, and shortly returned with the falcon; but the door was hardly opened before she darted from his fist and perched at once on the shoulder of her beloved and long-lost protector, evincing by every means in her power her delight and affection, rubbing her head against his cheek, and taking hold of the buttons of his coat and champing them playfully between her mandibles one after another. This was enough. The jury were unanimous. A verdict for the plaintiff was pronounced.—*National Magazine.*

## IMPORTANCE OF THE BAMBOO IN CHINA.

It is one of the most valuable trees in China, and it is used for almost every conceivable purpose. It is employed in making soldiers' hats, shields, umbrellas, soles and shoes, scaffolding poles, measures, baskets, robes, paper, pencil-holders, brooms, sedan-chairs, pipes, flower-stakes and trelliswork in gardens; pillows are made of the shavings; a kind of rush cloak for wet whether is made from the leaves, and is called a So-o, or "garment of leaves." On the water it is used in making sails and covers for boats, for fishing rods, and fish-baskets, fishing stakes and buoys; catamarams are rude boats or rather floats, formed of a few logs of bamboo lashed firmly together. In agriculture the bamboo is used in making aqueducts for conveying water to land; it forms part of the celebrated water-wheel, as well as of the plow, the harrow, and other implements of husbandry. Excellent water-pipes are made of it for conveying springs from the hills, to supply houses and temples in the valleys with pure water. Its roots are often cut into the most grotesque figures, and its stem finely carved into ornaments for the curious, or into incense-burners for the temples. The Ningpo furniture, the most beautiful in China, is often inlaid with figures of people, houses, temples, and and pagodas in bamboo, which form must correct and striking pictures of China and the Chinese. The young shoots are boiled and eaten; and sweetmeats are also made of them. A substance found in the joints, called tabacheer, is used in medicine. In the manufacture of tea it helps to form the rolling-tables, drying baskets, and sieves; and last, though not least, the celebrated chop-sticks, the most important article in domestic use, are made of it.

However incredulous the reader may be, I must still carry him a step farther, and tell him that I have not enumerated one-half of the uses to which the bamboo is applied in China. Indeed it would be nearly as difficult to say what it is not used for as what it is. It is in universal demand in the houses and in the fields, on water and on land, in peace and in war. Through life the Chinaman is almost dependent upon it for support, nor does it leave him until it carries him to his last resting-place on the hill side, and even then, in company with the cypress, juniper, and pine, it waves over and marks his tomb. At the time of the last war, when the Emperor of China, very considerately, no doubt, wanted to conquer the English by withholding the usual supplies of tea and rhubarb, without which, he supposed, they could not continue to exist any length of time, we might have returned the compliment, had it not been possible for us to have destroyed all his bamboos. With all deference to the opinion of his celestial Majesty, the English might have survived the loss of tea and rhubarb, but we cannot conceive the Chinese existing as a nation, or indeed at all, without the Bamboo.—*Fortune's China.*

## SUSCEPTIBILITY OF ANIMALS TO ATMOSPHERIC CHANGES.

In the common sensations of life we perceive a distinction according as the exciting cause is agreeable or otherwise, whether it presents itself as pleasure or dislike, bodily strength or weakness, activity or fatigue, warm or cold, by pressure or tension of the atmosphere, &c. By these combinations of sensations all animals, in which they are strongly developed, are enabled to anticipate atmospherical changes before the most delicate instruments give any indication of them, and in a minor degree the same is traceable in persons of great nervous susceptibility. In the animal world it extends not only to creatures of the land and of the air, but also to those which inhabit the water.

The actinie throw out their feelers and expand themselves when a continuance of fine weather is to be expected, but withdraw and contract themselves, even in a room, when a change is impending. The muscles, before the approach of a storm, spin several new threads to secure their hold on the rocks; and leeches, rise to the surface of the water before rain. Spiders enlarge their webs during fine weather, but spin only short threads; work seldom, or hide themselves in corners, during rain. Many beetles, by their active flight and humming sound, give tokens of the morrow's brightness. Before rain bees remain either in their hives or in the neighborhood of them; and ants convey deep into their cells the pupæ which they expose to the sun in fine weather.

The leeches rise anxiously to the surface of the water before a storm, and hence in Germany they are called weather fish, and are kept in glasses, where by their uneasy movements they denote a change twenty-four hours in advance, and from the same cause many fish forsake the sea for the rivers; the groundling is roused into activity, the silurus leaves the deep water; and the eels become lively. If the lightning strikes the water the perch sickens and dies; the snake and the slow worm are restless before a storm; toads leave their concealment before rain; ducks are busily active, and swallows fly lower.

Before a storm breaks forth many birds, such as the crossbill and plover, are uneasy, and show themselves less, and while any species of water-fowl hurry for shelter to the shore, the petrel, as if rejoicing in the coming conflict of the elements, dashes forth and defies its power. If the atmosphere be lowering in the morning, pigeons feed rapidly and return to their nests; and the hare hides itself, but the mole comes to the surface of the ground, and the squirrel seeks its nest and shuts its entrance. This susceptibility of atmospherical changes influences also materially the natural economy of some animals; the wild rabbit, for instance, which feeds chiefly in the evening or at night, comes forth at noonday, if the weather portends rain, and loses its natural timidity in its eagerness to procure food. —*Thompson's Passions of Animals.*

It is impossible to be sincere, without wounding vanity—just, without offending some pretension—generous, without attacking selfishness.

# Sunday Reading.

## CONSOLATION.

There are moments when the spirit
Sinks, too faint for human aid;
When all hopes we may inherit,
Are in dust and ashes laid.
Voices dear to which we hearkened,
Into utter silence fall,
And the very sunshine darkened,
Streams more faintly on the wall.

Happy they who then can borrow
Comfort from a higher life,
And from some diviner sorrow,
Call a calmness to their strife;
Who can hear a voice from heaven,
Bidding all their anguish flee;
"Since no earthly help is given,
Heavy-laden lean on me.

"Ye who labor, I have loved you,
As you toil for others' good;
By their baseness I have proved you,
By ingratitude withstood;
Once for man my tears fell faster,
Reaping scorn for my reward;
Asks disciple more than master,
Or the servant than his lord?"

## "LET ME DIE QUIETLY."

"Be still—make no noise—let me die quietly."—*Vice President King.*

"Be still!" The hour of the soul's departure is at hand; Earth is fading from its vision; Time is gliding from its presence! Hopes that cluster around young life, that swell in the heart of manhood: have fallen from around it, like the forest leaves, when the frosts of autumn have chilled them unto death. Ambition, with its hollow promises, and pride, with its lofty look, have vanished away. The world, with its deceitfulness, pleasure, with its gilded temptations, are gone, and alone, in utter destitution of all that time promised, it must start on its solitary journey across the valley of the shadow of death!

"Make no noise!" Let the tumult of life cease. Let no sound break the soul's communion with itself ere it starts on its returnless flight. Trouble it not with the accents of sorrow. Let the tear stand still on the cheek of affliction, and let not the wailing of grief break the solemn silence of the death scene. Let it gather the accents that come from within the dark shadows of eternity, saying to it, come home. The whispering of angels are in its ear; obstruct not their silvery voices by grosser sounds. A far off music comes floating to it by the air. 'Tis the sound of the heavenly harps touched by viewless fingers—mar not the harmony by the discords of earth.

"Let me die quietly!" The commotions of life, the struggles of ambition, the strife and warring with human destiny, are over. Wealth accumulated must be scattered; honors won must be resigned, and all the triumphs that come within the range of human achievement be thrown away. The past, with its trials, its transgressions, its accumulating responsibilities, its clinging memories, its vanished hopes, its rendering up to the future its long account; disturb not the quiet of that awful reckoning.—Speak not of fading memories, of affections whose objects perish in their loveliness, like the flowers of spring, or wither in a slow decay. Talk not of an earthly home where loved ones linger, where a seat will soon be vacant, a cherished voice hushed forever, or of the desolation that will seat itself by the hearth-stone. The soul is at peace with God, let it pass calmly away. Heaven is opening upon its vision. The bright turrets, the tall spires, the lofty domes of the Eternal City, are emerging from the spectral darkness, and the glory of the Most High is dawning around them. The white throne is glistening in the distance, and the white-robed angels are beckoning the weary spirit to its everlasting home. What is life that it should be clung to longer? What the joys of the world, that they should be regretted? What has earth to place before the spirit of a man, to tempt its stay, or turn it from its eternal rest.—*Albany Register.*

## THE VOICE OF CONSCIENCE.

What does she say is the great end of life? Listen to her voice in the chamber of your own heart. She tells you that there is one stream that is pure, and that stream flows from the throne of God; but one aim is noble, worthy of an immortal spirit, and that is, to become the friend of God, so that the soul may wing her way over the grave without fear, without dismay, without condemnation. There is only one path passing over the earth, which is safe, is light, and which is honorable. It is that which Jesus Christ has marked out in his word, and which leads to glory. Let conscience speak when you are tempted to waste a day, or an hour, or to omit any known duty; and she will urge you, by all the high and holy motives of eternity, live for God, to give your powers to him, to seek his honor in all that you do.

"Solidarite."—This is a favorite word of Kossuth's. It is French and has not yet found its way into our dictionaries. It expressos, generally, that the life of man is not exclusively the life of an individual, but life which he possesses jointly with his race; that men in *solido*—soldered together, in one, if we may say so; that each man is an indivisible, indissoluble part of the life of all men, and all men are invisible parts of each man. St. Paul gives its meaning thus:—"For as we have many members in one body, so, we being many, are one body in Christ, and every one members of another." See also Ephesians, iv. 25., and other places. No word in English conveys what is expressed by solidarite, or soldarity as it is now generally written.—*The Una.*

Integrity is the best mantle.

## A SPRING MORNING.

From my couch of broken slumber
Where, through all the weary night,
Sad and fearful dreams have hovered
'Round me, with their mystic light.

Haste I to the cheerful sunlight,
And the grateful morning breeze,
And the gentle, soothing whispers,
Of the wind among the trees.

Sweet the balmy breath of heaven
On my fevered, aching, brow,
Sweet the influence that bringeth
Gladness to my spirit now.

Round me, song and sweets are wafted,
Breathing life, and joy, and love:
Gazing down in love, upon me,
Is the azure sky above.

Waving grasses on the hill-side,
Rolling on before the breeze,—
Shadowy waves of dreamy softness,
Changeful as the watery seas.

Bending showers of snowy blossoms,
Dallying in the morning air,—
Smiling meadows, deepening forests,—
Glories greet me every where.

Earth is lovely in her greenness,
In her freshness and her bloom;
Type of the immortal verdure,
That shall smile beyond the tomb.

Barre, N. Y., May, 1853. VIANA MEADOWS.

## ANGEL LILLIE.

BY ALICE ARUNDEL.

LIKE a stray sunbeam, or a star of brightness, came my loved and darling sister LILLIE to our lonely home. I remember how I loved her even then, as I gazed in childish wonder on our angel visitant; secretly fearing every moment she would vanish from my sight, and leave me sisterless again.

But every day she grew more beautiful, till at last I dared to hold her dimpled hands in mine; and kiss her fair young cheek, and eyes all sparkling with the dews of Paradise. Months passed, and then her tiny feet went flying through the house, and her childish face was everywhere seen gazing in wonder on the strange things around her; but when summer came again I led her forth, and we played for hours together 'mid the birds and blossoms, she the fairest flower of all, and singing sweeter far than all the wild-wood birds she loved so fondly. I remember well her glee when I crowned her golden head with flowers one day; how her blue eyes sparkled with delight as she danced about the house to show her floral wreath to all.

It was not strange they loved her more than me; she, our beautiful — our angel Lillie! I never coveted the love they showered on her, she was so much more worthy of it all than I; and my greatest care was to make her more happy.

Oh! it was beautiful to see that fair young child kneel by my mother's side, and, with her small white hands close folded to her breast, and her deep blue eyes upturned to Heaven from whence they came, repeat the prayers which we had learned together.—Even then her face seemed to wear a spiritual radiance, I could not comprehend — but the Savior's words I had heard my mother so oft repeat—"Suffer little children to come unto me, for of such is the kingdom of Heaven," came to my mind with a new and sudden power, and I thought indeed they must be true. Then, when our prayers were said, I took our darling Lillie to my heart all night; her fair golden head pillowed upon my loving breast,—blest, oh! how blest in having her so near me. I did not wonder that my father, when he came from business, could not bear our darling out of sight, but kept her a willing prisoner in his arms.

'Twas there she first learned to read, slowly and carefully at first, as all children do; but when she had learned to read readily and well, a new world seemed opened to the fair young student. Her expanding mind took a strange delight in everything she read, and many a time the deeds of heroes and heroines were acted over again with interest as deep as though they were indeed real. Her thirst for knowledge seemed never gratified, she would sit long hours poring over her books — something uncommon for a child of her age — and her readiness in learning almost astonished me. Indeed there was something about her I could never comprehend — a strange unearthly power seemed given to her. I saw it when she talked of noble deeds which she had read, and when my mother spoke to us of God and Heaven, when she told us of the angels there who worship before His throne, with golden harps in hand: our Lillie's cheek grew bright, and her dark eye glowed as she whispered — "Mother, I will be an angel too." Men call it precocious, but 'twas something more, it seemed a sort of inspiration born with her from Heaven, a deep unearthly inspiration — and yet she loved her birds and blossoms none the less, but would spend long hours in gathering flowers,— those she had loved in childhood best, fair, frail blossoms like herself,—singing gaily with the birds the while.

Thus years sped on like a dream of bliss, and we saw our darling Lillie a beauteous and gifted maiden, loved and admired by all who knew her; but though flattered and caressed by all, her heart still retained its child-like purity, its undying love for the dear home circle. By no others was she appreciated; others loved her for her wondrous beauty, that strange fascination, but they knew not the hoarded wealth of love within her heart. Cold and heartless themselves, they deemed she must be like them, or knowing she was not, they could not comprehend her nature — passionate and ardent as it was — they called her strange and wild, and some even blamed sweet Lillie for that which they could not comprehend. Why do they not blame God for being infinite—for a nature so lofty and exalted, we in our weakness fail to understand?

Spite of the love we gave, her heart was often sad—she longed to be appreciated and loved by those around her; not merely for her beauty, but for her own true heart. Often came yearnings for a better life, and then sad thoughts of God and Heaven — and many bitter tears has my pure Lillie shed upon my breast, in the lone night hours, with no ear to hear, no eye to see but God's and mine — tears for her talents unimproved—that she had failed to be what she had wished, an angel comforter on earth, preparing for her home in Heaven. Few have as little need of tears as she, my pure, my peerless Lillian! Why should *she* weep tears of sorrow for duties unperformed? I had often prayed that I might be like her, as gentle, as forgiving as she seemed; and in my intense love I worshipped her as a part of Heaven — as an angel God had lent to us; nor deemed that there was wrong in doing so.

I can ne'er forget her look of intense happiness as she talked to me of Heaven, and her resolve to live for God alone; to be devoted wholly to His will. It was a look which angels wear — they who had visited and comforted my sad loneliness sometimes. Daily our sweet Lillie seemed to grow more beautiful; there was a softer, more spiritual light in her dark eye, which told that her thoughts belonged not to earth, but Heaven.

'Twas a glorious spring day, that we stood beside the baptismal waters, a fitting spot for such a scene. I only know 'twas beautiful, for I saw only my angelic sister there. She had never seemed so beautiful before, as when they led her down into the clear waters. Her fair golden curls seemed floating like a halo "round the loved one's head;" and there was a Heaven of perfect peace and love in her calm sweet face. The place was still as death. Even the careless looker on, who could not comprehend her feelings, *felt* the solemnity of the scene.

But there was one that day, who gazed on that beautious maiden lovingly; who longed, yet dared not clasp her to his aching heart. He was a stranger then, but he sought and won my darling Lillie's love; such love as woman never gave before. Oh! she was happy then, what could she ask for more? You should have seen how more than beautiful she grew; her heavenly and her earthly loves seemed to guard her pure sinless heart from evil. Her lofty brow seemed paler than before, but I noticed how the crimson deepened on her cheek when animated, and her eyes grew more intensely bright; and I thought these but the signs of health. But when others gazed on her they shook their heads fearfully; and muttered blessings on our darling Lillie; and I heard them whisper, "she will soon be gone." What could they mean? *Dying?* Could *she* be dying? She so young, so loved; must she be taken from us? Oh, no! it *could* not be so: and I sought to drive the thought away like some dark, fearful dream. But oh! it was too true. I saw her fading day by day; her step grew languid and her laugh less gay, and she told me she was dying — calmly, hopefully. "You will not mourn for me when I am gone," she said. "I shall go where sorrow never comes, where all tears shall be wiped away. Why mourn that I am going home to my Father's house in Heaven? I shall be an angel there, with a golden harp, and I will come and comfort you when I am gone."

And thus she passed away. I remember, oh! how vividly, the night we stood beside her dying bed. Her slender form had lost its roundness; and her thin, transparent hands were clasped in his, the loved one of her heart, who sat gazing upon the pale unearthly being before him, with a look of anguish it was hard to bear. Her long golden curls were pushed back from her pale, high brow; and a look so lofty settled there, she seemed like an angel planning her flight for Heaven. Her thoughts seemed wandering for a moment, then she said,—"Mother I hear sweet music, and see bright angels; do you not see them too? They have come to bear me home. Come nearer—kiss me sister, mother,—dear sister Alice,— there, good-night. Closer, come nearer, love," she whispered. "Kiss me darling Ernest — do not mourn, you will meet me soon in Heaven. I am only going first; but the way is not dark and lone.—I can feel my blessed Saviour's presence even now. I can lean upon His arm. 'Yea, though I walk through the valley of Death, I will fear no evil, for *Thou* art with me.' It is growing dark, I can scarcely see you now. Take me in your arms, darling. God bless you love, I go. The angels call—one kiss—Farewell."

Then he laid her back upon the pillow, the form of our loved, our angel Lillie; but *she* — the soul that was far more beautiful, was at home in Heaven. Even then I could not realize that she was ours no longer. *Could* it be Death? It seemed a calm and gentle slumber. So peacefully she died; only there was that lofty, angelic look, known to no other sleep but that which knows no waking. She woke no more on earth; and they robed her in a shroud of white — the bridal robe of Death. They laid her in the narrow coffin, and placed white roses and pale lillies in her hand, and I seemed stunned with the weight of grief which was crushing me. But, Oh! 'twas fearful to watch the heart-broken agony of that noble youth — her loved and darling Ernest. There were no tears from those sad, fixed eyes; his grief was too deep for that. His whole being seemed crushed with a shock too great to bear.

All "that lonely night, when all was over," he sat beside the coffin of our angel Lillie, calling so vainly on the loved one's name. But when the morning came they bore her sadly to the cold, dark grave—they laid her there alone. No, not alone; we left one sad heart-broken watcher by her side. His life seemed gone, and with a slow, sad step, he wandered daily to the grave of his lost darling, waiting sadly for the summons that should re-unite them in the spirit world.—It came at last, the vision of his love; and they laid him 'neath the green sward by her side. Years have passed since they laid her there; but I can ne'er forget the agony of that farewell. I have learned to bless our Father that He took my idol from me: and drew my heart to Him. God helping, I will try and be like her, "an angel too."

## HINTS ABOUT FURNITURE.

THE prevailing evil of the present day is extravagance. I know very well that the old are too prone to preach about modern degeneracy, whether they have cause or not; but, laugh as we may at the sage advice of our fathers, it is too plain that our present expensive habits are productive of much domestic unhappiness, and injurious to public prosperity. Our wealthy people copy all the foolish and extravagant caprices of European fashion, without considering that we have not their laws of inheritance among us: and that our frequent changes of policy render property far more precarious here than in the Old World. However, it is not to the rich I would speak. They have undoubted right to spend their thousands as the please; and, if they spend them ridiculously, it is consoling to reflect that they must, in some way or other, benefit the poorer classes.—People of moderate fortunes have likewise an unquestioned right to dispose of their hundreds as they please, but I would ask, Is it wise to risk your happiness in a foolish attempt to keep up with the opulent? Of what use is the effort which takes so much of your time, and all of your income?—Nay, if an unexpected change in affairs should deprive you of a few yearly hundreds, you will find your expenses have *exceeded* your income; thus the foundation of an accumulating debt will be laid, and your family will have formed habits but poorly calculated to save you from the threatening ruin. Not one valuable friend will be gained by living beyond your means, and old age will be left to comparative, if not utter, poverty.

There is nothing in which the extravagance of the present day strikes me so forcibly as the manner in which our young people of moderate fortune furnish their houses.

A few weeks since, I called upon a farmer's daughter, who had lately married a young physician of moderate talents, and destitute of fortune. Her father had given her, at her marriage, all he ever expected to give her, viz., $2,000. Yet the lower part of her house was furnished with as much splendor as we usually find among the wealthiest. The whole two thousand dollars had been expended upon Brussels carpets, alabaster vases, mahogany chairs and marble tables. I afterwards learned that the more useful household articles had been forgotten; and that, a few days after her wedding, she was actually obliged to apply to her husband for money to purchase baskets, iron spoons, clothes lines, &c., and her husband, made irritable by the want of money, pettishly demanded why she had bought so many things they did not want.

Did the Doctor gain any patients, or she a single friend, by offering their visitor water in richly cut glass tumblers, or serving them with costly damask napkins, instead of plain soft towels? No; their foolish vanity made them less happy, and no more respectable.

Had the young lady been content with Kidderminster carpets, and tasteful vases of her own making, she might have put one thousand dollars at interest; and, had she obtained six per cent., it would have clothed her as well as the wife of any man, who depends merely upon his own industry, ought to be clothed. This would have saved much domestic dispute; for, after all, human nature is human nature, and a wife is not better beloved—because she teases for money. —*Mrs. Child.*

## SPEAK NOT HARSHLY.

SPEAK not harshly to the erring,
If you wish to bring them back,
From the path of vice and folly
To the straight and narrow track;
But with accents kind and gentle,
Speak to them in kindest tone:
You will bring them back to virtue
E'er hopes latest spark has flown.

Speak not harshly to the aged,
For life's journey's nearly run,
But with kind and soothing accents
Cheer their last sad setting sun;
You will reap a life of pleasure
For those words in kindness given:
And when life's short journey's ended,
Find a rich reward in heaven.

Speak not harshly to the youthful,
For they'll have enough to bear;
Life at best has many sorrows,
Many hours of anxious care.
Let your words be ever gentle,
Bid them keep a cheerful heart,
And, when stormy clouds shall gather,
They will bid them soon depart.

Speak not harshly, nor in anger,
Lest you give another pain,
Lest you break those ties asunder,
That will ne'er unite again;
But be ever kind and gentle,
Aiding those who are distress'd,
And thy heart will e'er be cheerful,
And thy life be ever blest. E. L. N.

## A DEBATE IN CRANIUM ON GOING TO CALIFORNIA.

THE house having been called to order, the following preamble and resolution were read by the President:

Whereas, we believe, all things considered, that it will be for the peculiar advantage of the firm of Cranium & Co., to make a change in their business operations; therefore

Resolved, That it be recommended to said Company to close up business here, and to take immediate measures to remove and establish themselves in the gold regions of California.

Acquisitiveness was the first to speak.

"Mr. President: I, for one, heartily approve the measure presented for our consideration. I have long been dissatisfied with our present prospects. Here we are, plodding on from year to year, clearing only a few hundred dollars, while with the ordinary run of fortune in the gold regions, we might in the same time realize our thousands. The field of enterprise is as wide for us as for others, and I know not why we should not avail ourselves of the advantages it offers us. I have [illegible] failure. I long to [illegible] my eyes with the glittering ore. Sir, the measure will receive my cordial support."

Cautiousness was the next to speak.

"Mr. President: I think the gentleman who has just spoken, is altogether too sanguine in his anticipations. One would almost suppose from what he has said, that nothing was necessary for us but to resolve, and our end would be accomplished. Now, sir, in my humble opinion, there are many things to be considered, ere we decide on a measure so important. In the first place, it should be remembered that the extensive business of this firm cannot be so suddenly closed up, without involving a great sacrifice on our part. Then there is the hazard and expense of transportation, the fevers and sickness to which foreigners are exposed in a tropical climate; and besides, I deem it no trifling consideration to take up my abode among a semi-barbarous people, who would as willingly shoot me down as any game, providing they could make anything by the operation. Unless I have very good reasons for changing my views, I shall certainly oppose the measure."

He was scarcely seated before Combativeness was on his feet, saying:

"I am much surprised at the sentiments advanced by friend Cautiousness. Such notions may do very well for the child's nursery, but they are certainly unworthy of a man in his position. I think he has allowed his *caution* to bias his judgment.—Does he suppose that we think of getting to California without encountering very many obstacles? If he does he has certainly misapprehended us. We expect to encounter numerous obstacles. Indeed I should hardly be willing to embark in the enterprise if I thought it would be all smooth seas and pleasant sailing. I admit that every enterprise is attended with some uncertainty; but I believe that we possess within ourselves the elements of success. With the first speaker, I shall give the measure my cordial support."

Constructiveness next took the floor.

"Mr. President: I fully concur in the opinion expressed by the gentleman last on the floor, that we possess within ourselves the elements of success. I am well aware that many, in going to the gold regions, instead of improving their fortunes, have only sacrificed the little they already possessed. But, sir, with us the case is very different. If one expedient should fail, we have many others to which we can resort. For myself, I can secure a situation as an overseer in building, or I can construct various kinds of machinery to use in working the mines.—Our friend Calculation is just the one to engage in mercantile pursuits. With his talents for business he can secure any situation, and command almost any salary he chooses. Then there is our friend Tune; as the country advances in civilization, I doubt not his talents will be called into requisition. Our friends Combativeness and Firmness, will add energy and stability to the whole. With such facilities for success, I can hardly see, sir, how there is a possibility of failure."

Reverence next took the stand, and said:

"I rise with reluctance to express my humble sentiments. I have listened with attention to the remarks of my able predecessors, and while I admire the spirit of enterprise that seems to characterize most of those who have spoken, I must yet beg leave to oppose the measure. I doubt not we might be successful in a high degree in the accumulation of property; but, sir, were success assured me beyond a doubt, I should still oppose the measure. I cannot consent to leave my aged and infirm parents to the care of strangers, for the sake of increasing my worldly possessions. I feel that they have the strongest claim on my services, nothing shall induce me to leave them."

His remarks were seconded by Love-of-friends, Inhabitiveness, and many others, who declared that they should not be induced to leave their friends, and all the enjoyments of civilized society, for the sake of a little sordid gain. The motion was now called for by several members of the House. After much debate on both sides it was finally put, and lost by quite a majority.

LUCY A. LAKE.

## RAILROAD COURTESIES.

THERE are all sorts of men in all varieties of situations, and it doubtless will sometimes happen that a person unfitted for the post of railroad conductor may get temporarily into such a responsible position. As a specimen of the want of courtesy on the part of railroad conductors, the Buffalo Republic relates a circumstance told by an eye witness:

A man who lives within a few rods of a railroad, at a point not forty miles from Buffalo, wished to stop at a certain farmer's depot, some mile or so from his home.—He applied to the conductor to stop the train there and let him get out; but the conductor answered very gruffly that he should not stop there this time. Upon which the passenger [illegible] some four or five miles to the place where he lived again. Directly the conductor came round and demanded the fare to the next stopping place. The passenger replied that he should not pay, because he had already paid as far as he wanted to go; adding: "but since you would not allow me to get out at the depot and go home, I will now go on with you to the village, where I can get a ride back for nothing." The conductor became indignant, threw himself into a passion, bethought himself of his authority, rang the bell, stopped the train, and began to prepare for a forcible ejectment. "Stop," says the passenger, "if I must get out I must—there is no use of force"—so he got his carpet bag, took the arm of his wife, and, as they stepped down from the cars, he called the attention of the bully conductor to a snug cottage standing a few rods from the road, immediately opposite where the train stopped. "Do you see that house, Mr. Conductor?" "Yes, I see it—what of it?"—"That is my little home, sir—much obliged for your gentlemanly courtesy—good bye sir." The conductor gave vent to his vexation in the well known language of his class, jerked the bell, the train started, and the roar of laughter at the conductor's mortification rose above the rattling of machinery and the rumbling of the wheels.

## A YOUNG MAN'S COURSE.

I SAW him first in a social party — he took but a single glass of wine, and [illegible] piano with the request of a fair young lady with whom he conversed.

I saw him next—when he supposed he was unseen, taking a glass to satisfy the slight desire formed by his sordid indulgence, and the thought that there was no danger.

I met him next, late in the evening, in the street—unable to walk home; I assisted him thither; he looked ashamed when we next met.

I saw him next reeling in the street—a confused stare was on his countenance, and shame was gone.

I saw him once more—he was pale, cold and motionless, and was carried by his friends to his last resting place; in the small procession that followed every head was cast down and seemed to shake with uncommon anguish. His father's gray hairs were going to the grave with sorrow: his mother wept that she had ever given birth to such a child.

I thought of his future state—I opened the Bible and read—*drunkards shall not enter the kingdom of Heaven.*

SCOTT says that the most disagreeable of all things is "a vain, cold, empty beautiful woman, who has neither mind nor heart, but only features like a doll."

WE carry our neighbor's crimes in sight, and throw our own over our shoulders.

ROCHESTER, JUNE 11, 1853.

PUBLISHER'S NOTICES.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW-YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ ADVERTISEMENTS must be brief, appropriate to the objects of the paper, and accompanied with the cash.

## More Agricultural Journals.

OF late we have had the pleasure of adding several new rural journals to our exchange list. We extend a cordial welcome to these fresh and vigorous laborers in the field of Agricultural Literature—wishing each and all merited success and prosperity. Taking them in the order of reception, we make brief mention of the new recruits as follows:

*The Connecticut Valley Farmer and Mechanic*, a monthly of 16 quarto pages, hails from Springfield, Mass., where it is published by SAMUEL BOWLES & Co., in behalf of the Agricultural Societies of Hampden, Hampshire and Franklin Counties. It is edited by WM. B. CALHOUN, Esq., in conjunction with able representatives of the several Societies. The second (June) number is well filled, and in that respect creditable; but we can hardly commend the quality of paper used, or style of printing,—defects which may easily be remedied by the publisher. Terms, 50 cts. a year.

*The Farm and Shop* is the title of a semi-monthly journal devoted to Agriculture, Horticulture, Manufactures, General News, &c., published in quarto form (16 pages) at Indianapolis, Ind., by O. F. MATHEW, Esq., at $1 per annum. It is edited by Mr. M., assisted by JOHN B. DILLION. The contents of the numbers received indicate good taste and judgment, while the external appearance of the paper is highly creditable. The publisher seems determined to merit, and we trust will achieve, abundant success.

*The Iowa Farmer and Horticulturist*, edited by JAS. W. GRIMES and J. F. TALLANT, and published by MORGAN, MCKENNY & Co., at Burlington,—16 pages octavo, at $1 a year—makes a very good beginning. The first two numbers contain an excellent variety of valuable matter, indicating good judgment and tact on the part of the editors. It will do good, and aught to succeed.

## Women's State Temperance Society.

THE first Annual Meeting of this Society commenced its session in this city on the 1st inst., holding for several days. We did not attend, but learn from the daily papers that large numbers were present, and that several animated discussions [illegible] exciting topics. One of these was the proposal to allow men to hold office in the Society, (which was laid over,) and another was, who of the sexes should be elected. The following officers were chosen on the second day:

President, Mrs. E. C. VAUGHN, of Oswego; six Vice Presidents; Recording Secretary, Mrs. H. A. Albro, of Rochester; Corresponding Secretary, Mrs. A. Bloomer, Seneca Falls; Treasurer, Mrs. Marsh, Rochester; Executive Committee, Mrs. B. C. Allen, Rochester; Mrs. Angelina Fish, Victor; Mrs. H. W. Williams, Buffalo; Mrs. C. H. Robie, Buffalo; Mrs. Christie, Miss Mary S. Rich, New York; Miss Emily Clark, Le Roy.

The question of the election was, whether Woman's Rights should be made a distinctive object of the Society, or whether it should be confined to Temperance alone. Miss SUSAN B. ANTHONY was elected Recording Secretary on the first ballot, but resigned, alleging that the election of President indicated that a spirit was rife in the Society, with which she could not sympathize; it showed a disposition to sacrifice principle to expediency, and moreover the Society would not take Woman's Rights grounds. She said her heart was no longer with the Society. Resolutions of thanks were voted to Miss ANTHONY and to Mrs. STANTON, who also refused to act as one of the Vice Presidents. The election showed that the exclusively Temperance party in the Society was the strongest.

WESTERN HOUSE OF REFUGE.—The Rochester Union states that the Board of Managers at a regular meeting recently held in this city, decided to apply to the Legislature at its Extra Session for an appropriation of $25,000, to build a new wing, with a view to adding from 120 to 150 dormitories to the institution. The present number is 192—and the present number of boys is about 186—so that some six more will fill the house to its utmost capacity. The entire cost of this admirably constructed institution, to the State, is less than $80,000. The addition asked for is indispensable, and we doubt not that the Legislature will cheerfully grant the appropriation.

THE LEGISLATURE EXCURSION.—The recent opening trip on the New York Central Railroad was one of the most rapid on record, considering the size of the train, &c., going up—distance 305 miles—the actual running time is stated at 7 hours and 35 minutes. The return was accomplished in 7 hours and 44 minutes. The Road from the Falls to this city, made schedule time to the minute—running 76½ miles in 1 hour and 46½ minutes. We do not care to ride faster.

A very "pleasant time" was enjoyed at the Falls and if our Legislature work as fast as they travel the extra session will soon come to a close.

## Literary Notices.

FERN LEAVES FROM FANNY'S PORTFOLIO. With original Illustrations. Auburn: Derby & Miller, 1853.

WHEREVER the newspaper circulates, there have these "Fern Leaves" floated, so that few need information as to their character and style. Most of them are full of grace and beauty, the more abrupt and rude which have sometimes met us, having been omitted from the collection. Many of them now appear in print for the first time, and the longer sketches stamp FANNY FERN as an unmistakable genius of an original type—a type combining true power with the genuine Yankee spirit and character. It is the general remark of the readers of this volume, that they now really begin to appreciate its author.

The beauty of paper, print and binding, and the taste with which the work is executed, equal that of the eastern publishers, and show that enterprise and tact can build up a successful and profitable business almost anywhere. We are glad to see these and other proofs of it almost daily. Sold at DEWEY'S, Arcade Book Store.

FORESTER'S BOY'S AND GIRL'S MAGAZINE, is a juvenile Monthly published by GEO. C. RAND, Boston, at $1 per year. It has 32 pages of good reading for the young, and its numerous engravings are well selected and executed. Instruction as well as amusement is considered of importance, and both are well combined in its editing. DEWEY, agent.

## Correspondence.

### Incidents of Travel Westward.—No. 5.

*"Western Reserve," its area—Whence its name—Anecdotes of Gov. Winthrop and Charles II—By whom the Reserve was settled—Village of Hudson, its settlement in 1800—"Western Reserve College"—Interview with the President—Education in the West—Emigration Westward.*

NEW BOSTON, Ohio, May, 1853.

EDS. RURAL:—There are many historical facts connected with our early colonial times, which are equally interesting and instructive. This is especially true of that portion of Ohio called the "Western Reserve." It is situated upon the Lake and is some 120 miles long by 60 broad, comprising an area of 4,608,000 acres. Its history is somewhat as follows:—In the year 1620, King JAMES incorporated the Council of Plymouth, and gave them, by charter, "the tract of land in America between the 40th and 48th degrees of North latitude, *from Sea to Sea*, to be called New England." In the year 1628 this Council of Plymouth granted to a company a tract of land called Massachusetts, of certain defined limits on the North and on the South, and in length and longitude throughout the main lands there, from the Atlantic on the East part, to the South Sea on the West part. This grant was confirmed by a charter from CHARLES I, in 1629.

A similar grant in 1631 from the Council of Plymouth (through the Earl of Warwick, who had received [illegible] to Lords SAY, SEAL, and others, of land south of Massachusetts from Narragansett River, 120 miles upon a straight line along the Sea Coast towards the South West, and within this breadth in length and longitude throughout the main lands there, *from the Western Ocean to the South Sea*. The English then called the Atlantic the Western Ocean, and the Pacific the South Sea. The Connecticut Colony purchased this grant, and in 1662 CHARLES II gave them a charter, confirming the boundaries. Hence the claim of the State of Connecticut to the belt of land between 41°, 42° 2m. North latitude, from Narragansett Bay across the Continent. This was a large tract, and of immense prospective value. Connecticut, in her Legislative capacity, in 1786 relinquished all claims on Western territory, and "reserved" a belt of land running 120 miles West of Pennsylvania's Western boundary. Hence the name of "Western Reserve."

When GOV. WISTHROP appeared before the King in behalf of Connecticut, to obtain a royal charter, he presented him with a favorite rug, which King CHARLES the 1st had given to WINTHROP'S grand-father. CHARLES II was so pleased with this token, reminding him of his unfortunate father, that he gave Connecticut the most liberal charter that had ever been granted; and confirmed the title in its full *breadth and extent to the Pacific Ocean!* Tradition says that the King inquired how far it was to the Western Ocean? The reply of the agent was, that it had never been measured accurately, but it was easy enough to see the Ocean from the tops of the hills. Whether the Governor intended to exercise a little Yankee shrewdness, and obtain as large a slice as possible in the New World, or whether he forgot to help the King to put a right construction upon his answer, we will not attempt to decide; but certainly the bargain was not a bad one for the Governor, and the results have been most happy to the people of Connecticut, and to the inhabitants of the "Western Reserve."

The sale of these lands laid the foundation of the large and permanent school fund, which is the glory of the parent State, and has enabled her to secure the education and intellectual elevation of her sons in all future generations. These lands were surveyed, and early sold to the most enterprising, intelligent and industrious men from Connecticut. They were generally characterized by steady habits, good morals, and attached to the interests of religion, and every way qualified to lay the foundation of good society.

Hudson is a thriving village, situated upon the Cleveland and Pittsburgh Railroad, some twenty-five miles from the "Forest City. The first settlement in this town was made by DANIEL HUDSON, Esq., who emigrated from Connecticut in the year 1800. This place is the seat of the "Western Reserve College," also founded by Mr. HUDSON. The College buildings are five in number, built of brick, and are on a swell of land overlooking the village, which gives them an imposing appearance. The College takes a high stand, and is patterned from "Yale," giving a thorough and complete education to its graduates. We were honored with an interview with President PIERCE, who is a right down good natured, social, and highly intelligent gentleman. He has presided over the institution since 1831. Through his labors at home and abroad, the College is well endowed, and already ranks among the first in the West.

The nation has certainly a deep interest in the founding and growing prosperity of institutions of learning in the new States. Tens of thousands of the inhabitants of the Old World, attracted by the light of freedom's torch, or impelled by the love of gain, are seeing their way out of the darkness of antiquated misrule and despotism, and crowding to our shores. Let them come. They dig our Canals, build our Railroads and perform much labor, needful and urgent; but many are irreligious, intemperate, and ignorant, and often sell their votes to the highest bidder. We must look to our educational system as, in the order of Providence, our great defence against the evils resulting from this overwhelming tide of foreign emigration—masses, who from their birth, have known no other inheritance than poverty, ignorance and vice.

The great West is the field for emigration, both from foreign lands and the eastern parts of our own; over half a million came over to us during the years '48, '49 and '50. It is believed that a much greater number will be landed upon our shores the present summer than has ever been in one season since the discovery of the Continent. A large proportion will settle in the West. From the older States too, the stream is constant. Fifty years ago there were less than 300,000 people West of the Alleghanies. Now there are over 10,000,000. S. B. ROCKWELL.

### Letter from Indiana.

LAPORTE, Ind., May, 1853

FRIEND MOORE:—When I reached Laporte, the county town of Laporte county, I was very happily disappointed in the appearance of the place, and surrounding country. Reaching here in the morning, I met a friend—a resident of this county—who took me into his buggy and conveyed me to different portions of the county. Instead of finding it a low, monotonous, prairie surface, intermixed with swamps and marshes,—I found it the paradise of the west. There are prairies, but they are somewhat rolling, and not vast and Ocean-like, as are those of Illinois. Door Prairie, in Laporte county, is one of great beauty—with splendid groves, and a soil of great richness and fertility. There are farms here containing from one to six hundred acres cultivated in the best manner—and great yields are the result of the husbandman's toil. The beautiful groves seem the work of artistic skill, instead of natural arrangement. I had the pleasure of rambling thro' one of these, which contained about six hundred acres, and almost perfectly round in its shape.—The growth of wood is large, and a basswood tree which I measured, four feet from the ground, had a diameter of *seven feet*, and was proportionally as high.

The wheat crop is large and forward. I passed through several large [illegible], and I saw no field but what would reach [illegible] as it stood. It presented a very even appearance, besides being thick on the ground.

Mr. WILKINSON, formerly a resident of Genesee county, N. Y., and with whom I spent a day, says his wheat will yield [illegible] bushels per acre at an ordinary average. I think I never saw finer, larger, and more even fields of wheat in my life than in Southern Indiana. The season for spring crops has been much retarded by the cold, wet weather, which I am told is very unusual.—This, in fact, I find to be the general complaint through all the Western States. In consequence of the rain, corn is backward—some up—and some not planted. I saw the opperation of planting a large field yesterday. The ground being prepared, is marked out in furrows, the corn dropped in those furrows, after which a person crosses them with a cultivator, which covers it. This is a rapid mode of planting corn.

The singularity from which sprang the name of *Door* Prairie is probably worthy of note. A large strip of timber extended from each side of the Prairie to the centre, came together within about *six rods*. This formed an opening through which travelers were obliged to pass, hence the name *Door Prairie*.

Improved farms are held by those with whom I conversed, at from twenty-five to forty dollars per acre. This is a guarantee of the quality of the soil, and beauty of the country. From here I pass through Ohio, where you may hear from me again. Yours, &c., C. W. HOBART.

—— The late news from Mexico indicates that Santa Anna has resolved to assume abitrary and despotic powers, which will end in his being driven again into exile in less than a twelvemonth.

—— The Lumber Trade passing through the Canals of New York is enormous. Within the last ten years it has nearly quadrupled and in 1852 the aggregate value was over eleven million of dollars!

—— The City of Bremen is about to send a block of German marble for the Washington Monument. It will bear the inscription:—"To Washington, the great, the good, the last, from friendly Bremen."

—— The state of Pennsylvania has appropriated $193,377 96 for the support of common schools for the current year. Each county of the state receives an amount equal to 36 cents to each taxable inhabitant.

—— The total number of horses required for the regular lines of omnibuses in Philadelphia, is stated to be 1,404; the cost of running each omnibus is about $5 per day, and the average daily receipts of each about $7.

## N. Y. Legislature.

### Extra Session.--Synopsis of Proceedings.

TUESDAY, May 31.—*Senate.*—Various local and private bills were reported, noticed, or passed; among the first, one extending the benefits of the New York City Juvenile Asylum, and among the last, to amend the General Manufacturing Law, and to appropriate the Revenues of the Deposit and Literary Funds. The Maine Law was warmly discussed, but the Senate were equally divided upon it, and the Lieut. Governor's vote was given to prevent any action being taken.

*Assembly.* Some of the members wished to reconsider the acceptance of the invitation to visit Niagara. The special order—the Canals—then came up, and Messrs. LOOMIS, FORSYTH, SHAW, D. B. TAYLOR, HENDEE and SESSIONS expressed their sentiments, occupying the time until recess. A Committee on Railroad Accidents was appointed. The Canal resolutions were debated all the afternoon session. Several bills were reported, but none passed during the day.

WEDNESDAY, June 1.—*Senate.*—Several petitions were presented, bills noticed and reported, but none of general interest were passed. Considerable time was spent in an attempt to locate the Western Lunatic Asylum, but without success.

*Assembly.*—Reports, notices, &c., as usual, and then came up the Canal Resolutions. The Minority plan, as amended, was *lost*—ayes 21, nays 70. The vote was then taken on the Majority (Mr. WEST'S) plan, which was *adopted*, 79 to 40. A Message was received vetoing the Banking Basis Extension bill. Other matters were debated until adjournment.

THURSDAY, June 2.—*Senate.*—The Senate received an invitation from the owners of several lines of Canal Boats to take a pleasure trip on the Erie Canal! It was referred to the Canal Committee, and seemed highly relished by the grave Senators. The Assembly Resolutions on the Enlargement were received and debated, and lost, 6 to 19.

*Assembly.*—The Canal Boat Excursion invitation was received, and, after debate, laid on the table. The bill distributing the income of the Literature Fund was passed. The House voted to print 50,000 copies of Canal Commissioner MATHEN'S Vindication. The afternoon session was spent in debate upon the New York School bill, which was finally passed.

FRIDAY, June 3.—*Senate.*—There was a sharp debate upon a proposition for a Committee of Conference on the Canal Resolutions, but no vote was taken. Adjourned to Monday 6 ½ P. M.

*Assembly.*—Nothing of special interest was accomplished. There was a long debate upon reconsidering the vote to print 50,000 copies of Mr. MATHEN'S defence. Notice was sent in that New York city had paid the School Tax. There was some talk of adjourning on the 7th inst., but no vote. Adjourned, for the Excursion to Niagara Falls, over to Monday evening.

### The Season and the Crops.

THE weather has been warm and pleasant, the greater part of the week, and vegetation has gone forward rapidly. Considerable planting has been done, and if a favorable summer ensues, good spring crops may yet be realized. Wheat is rapidly heading out in Western New Yok. We annex a few notices from papers in different sections of the country:

In consequence of the heavy rains of late, and the cold weather, farmers in this county have done little or nothing towards putting in their spring crops. They feel quite uneasy as they have nearly all to do yet; many of them have not even plowed their land, and some of those who have will be unable to put in a seed for a week to come, owing to its being so wet.—*Orleans Amer.*, June 2.

[illegible] will be an excellent crop of grass, without doubt throughout Eastern Pennsylvania, if the appearance of the fields in Montgomery, Berks, Chester and Philadelphia counties is any indication.—*Mont. (Pa.) Ledger*, May 31.

[illegible], Esq., Guilford, has a field of [illegible] which he brought stalks measuring over [illegible] feet, without including the beard. The grain [illegible] never gave better prospects of an abundant harvest than at present; and the same may be said almost every other description of vegetation.—*Herkimer Palladium*, May 30.

Every [illegible] looks bright and prosperous in the vegetable [illegible]dom. The recent rains have laid deep and [illegible] foundation for a heavy crop of grass and all the cereal grains: and the escape from frosts [illegible] gives a fair promise of an abundant fruit harvest. However, here in the Mohawk Valley, we can not crow too loud, lest Jack Frost should clap his nippers upon our plum trees before we get to the other end of June.—*Herkimer Journal*, June 2.

A correspondent who has recently traveled through Ohio, says:

Wheat, in Southern Ohio, is very heavy, and is now (May 28,) headed out. Farmers are hoeing corn and and potatoes; still it has been very cold here, the last ten days, some frosty nights; peas, cherries, cucumbers, and strawberries are in market here in Cincinnati.

A KEY TO "BLEAK HOUSE."—A CHANCERY PRACTICE IN ENGLAND.—A Report of a Parliamentary Committee states these facts:—A tradesman died, some ten years ago, possessed of property to the amount of £1,000. The two executors under the will took no steps to wind up the affairs, and a creditor's bill was filed in Chancery twelve months after the testator's decease. The matter was referred to the Master; and although the business to be performed was of the merest routine kind, more than eight years had elapsed without anything having been done. Not a creditor had received a shilling of [illegible] debt; not a legatee had touched a sixpence of his legacy. The only sum really disbursed had been between £2,000 and £3,000 for *law cost* during the time.

—— The Brockport Journal notices the death of Mr. Elijah Foote, of that village, founder of the Brockport Collegiate Institute.

## News Brebities

—— There are at present over five hundred Americans in London as visitors.

—— The natives of Lahaina, Sandwich Islands, have formed an Agricultural Society.

—— The prospects are said to be fair for an abundant fruit season in Ohio this year.

—— The total number of inhabitants in Beloit, Wisconsin, is 2,374; dwelling houses 551.

—— Niagara Falls Village is to be lighted with gas, the works to be completed in June, 1854.

—— The population of Newark, according to its directory, now numbers nearly 50,000 inhabitants.

—— The city Government of New Bedford have appropriated $2,000 for the celebration of the 4th of July.

—— The water of Lake Ontario is said to be higher now than it has been known to be for some years back.

—— The penny subscriptions in England, to be placed in the hands of Mrs. Stowe, already amount to $6,000.

—— Sufficient stock has been subscribed to the Baltimore and Liverpool Steamship Company to build one steamer.

—— The Mormons of Beaver Island are getting a bad reputation for robbing and maltreating Michigan fishermen.

—— Several severe cases of cholera morbus have occurred at Wheeling, within a few days, from eating rhubarb pie.

——A great agricultural display and cattle show is to be held at the Berlin Thier Garden, which is well adapted to the purpose.

—— The N. Y. Musical World and Times is informed that the music trade of this country for 1852, amounted to $27,000,000.

——Moses Shepard, a rich Quaker bachelor, living in Baltimore, has donated $300,000, to build an Insane Hospital in that city.

—— The fly, it is said, has appeared in the wheat, in Washington county, Md., and is playing sad havoc with whole fields.

—— There are 156 persons employed in the New York Post-office, including 104 clerks, 44 carriers and 8 collectors of letters.

—— The Mirror says it requires a volume of 800 pages to contain the record of New York house holders and business men.

—— Geo. T. Brown, a Mexican War volunteer, hung himself on one of the trees in the Park, in Providence, on Wednesday night.

—— Professor Stowe is soon to return to America. Mrs. Stowe and her brother, Rev. Mr. Beecher, intend traveling in Switzerland.

—— The weekly line of U. S. Mail steamers to California is discontinued. They will sail only on the 5th and 20th of each month.

—— A man in New York sued for and recovered of another, the value of a strip of land, one and one seven-eighths of an inch wide.

—— The number of castles of which there are existing remains, in England is 461; Wales, 107; Scotland, 155; Ireland, 120; total, 843.

—— The sister of Kossuth is residing in New York, and offers for sale a rich assortment of laces which she brought with her from Brussels.

—— The fare between Louisiville and New York city has been reduced to $15. This is probably the cheapest traveling in the world.

—— Grace Greenwood will remain abroad during this year. Her headquarters will be at Rome. Her letters in the National Era are delightful.

—— A Russian Imperial Ukase obliges all young men to enter the army at the age of 18, those only excepted who are noble by descent.

—— Col. Benton has returned to Washington, and is about to resume the complication of his History of "Thirty years in the U. S. Senate."

—— There is not at this moment a saloon in Paris, where the experiments of the moving table, the hat, the key, and the watch, are not nightly tried.

—— Gov. Seward is to deliver an oration on the occasion of the dedication of the Capital University Buildings at Columbus, Ohio, in September next.

—— The largest pearl in the world weighs a few grains less than one-third of an ounce. It belongs to a gentleman in Kanawa, and is worth $5,010.

—— The youngest member of the House of Commons is Sir J. W. Ramsden, Bart, aged only 21 years, and he is one of the richest commoners in England.

—— There are at present in Australia, as we learn from good authority, dry goods enough to last the colony for the next six years, without another importation.

—— In 1825 there was one horse in New York to every thirty inhabitants; there is now one to every twenty three. The present horse population of the city is 22,540.

—— A party is being formed in Pennsylvania to carry with them to Liberia a steam engine and saw mill, to be located at Monrovia, the capital of the Republic of Liberia.

—— Lord John Russell, in reply to a question in the House of Commons, stated that the Emperor of China had applied to England for aid against his rebellious subjects.

—— The New York Medical Gazette states that twenty-nine suicides, five murders, and two hundred and nine cases of insanity, are directly traceable to spiritual manifestations.

—— The New Hampshire Patriot states that the fair of the State Agricultural Society is to be held on the 5th, 6th and 7th days of October, either at Manchester or Concord.

—— G. W. LeDuce, Esq., Commissioner to the World's Fair, left St. Paul, Minnesota, on the 13th inst., with a specimen of Minnesota production, in the shape of a live tame Buffalo.

—— It was frankly stated by John Q. Adams, in one of his congressional speeches, that the four years in which he occupied the Presidential chair were the most unhappy years of his life.

—— An official order from the Navy Department announces that bounty of $30 to abie, and $20 to ordinary seamen, will be paid to all enlisting in the Navy after the first of June.

—— A correspondent of the Syracuse Chronicle states, that all the members of the Unitarian Society in St. Louis, who were slaveholders, have lately emancipated their slaves, unconditionally

—— The Washington Monument is now 130 feet high. The last arrival, a block of beautiful birds-eye marble, was from the Grand Division of the Sons of Temperance of Western New York.

—— The returns show that during the year upwards of eleven hundred vessels have been lost on the coast of great Britain, with a loss of nine hundred lives. This greatly exceeds any previous year.

# Foreign Intelligence.

## Arrival of the Canada.

THE Canada arrived at Halifax, June 6th, with Liverpool dates to May 28th.

MARKETS—Flour market firm, with active consumptive demand, at an advance of 3d per bbl. Western canal 22s. 6d.@23s. 6d.; Philadelphia, Baltimore and Ohio 23s. 6d.@24s. per bbl.

Wheat in good demand, at former prices. Prime qualities advanced 1d.@2d. White 7s.@7s. 6d.; red 6s. 7d.@6s. 9d. Imports of corn large; prices slightly reduced. White 31s.; yellow 32s.@32s.6d.

Provisions—New beef 92s. 6d.@105s; do. pork 75s.; bacon, good inquiry, prices upward.

Ashes—Market firm, at 25s. 6d. for Pots and Pearls.

The Pacific arrived out on the P. M. of the 24th, in about 9 days and 23 hours, mean time.

ENGLAND.—On Tuesday night, questions were put to the Government in both Houses, to ascertain the position of England with regard to the critical state of Turkish affairs.

Lord Clarendon, in the Lords, and Lord J. Russell, in the Commons, stated that English and French representatives at Constantinople were acting in concert, and that the integrity of the court would be maintained.

It was supposed that Russia would insist on nothing incompatible with the integrity of the court, but at present the British Government give no further indications of the policy it would pursue.

A grand soiree, with an address to the Anti-Slavery Society, was given to Mrs. Stowe, at Almack's, London.

A meeting of the friends of Italy was held in London. Kossuth attended, but made no speech.

Mesana had arrived in London from his concealment on the Continent. He was in Milan three months before the insurrection, and one month after it, the facts being known to hundreds of Italians.

The Adelphi Theatre, Edinburgh, has been destroyed by fire.

Sir Richard Comzig, the historian, is dead.

☞ The sub-marine telegraph has been successfully laid between Port Patrick and Donaghade.

The Dublin Exhibition attracts 5,000 visitors daily. The Queen will visit it shortly.

TURKEY.—The court has refused to accept the Russian ultimatum.

The embassador of France had ordered the French fleet to the Dardanelles, supposed with the intention to prevent Russia from seizing or passing the Straits; but on the 20th it was still at Salamis.

# California News,

## Arrival of the Daniel Webster.

NEW ORLEANS, June 6.—The steamer Daniel Webster, from San Juan Rica, has arrived at this port, bringing San Francisco dates to the 16th of May.

The only San Francisco papers are of the 16th. Our despatches, therefore, must be very meagre.

The papers from the 1st to the 15th are hourly expected by the steamer Phila lelphia, from Aspinwall.

The mining interests are of a favorable character. The Sonora Herald records many lucky discoveries of large lumps, and also some new diggings on the river, and lumps valued at from $300 to $900 had been taken out.

# News Paragraphs.

☞ The census returns show that Pennsylvania ranks ahead of all other States in the number of Presbyterian Churches of all kinds, having 755, while New York has 682, and Ohio 659. In this year's Directory of Philadelphia, we find a list of 90 Presbyterian Churches located in the city and incorporated districts, but there are a number of others, among them several new ones, not set down. Last year $100,000 was raised in Philadelphia to build new and aid feeble Presbyterian Churches.

☞ There arrived at the port of New York, during the month of May, 30,234 emigrant passengers, of which number 12,179 were Irish, 10,986 German, 2,388 English, 1,214 Scotch, 1,072 French, 857 Swiss, and the remainder were from several other countries of Europe. During five months of the present year, 80,031 emigrants were landed at that port; the year previous, 100,225; in 1851, 100,560, and in 1850, 79,402.

☞ The St. Louis papers complain of scarcity of journeymen carpenters, bricklayers, and other building hands in that city. Journeymen carpenters generally receive $2 per day, but a first rate hand will command $2,25, while an inferior workman may readily obtain $1,75. Journeymen bricklayers receive generally from $2,50 to $3 per day. A first rate press brick or fine stock layer will receive from $4 to $5.

☞ Mr. F. B. King, at his plantation in Dallas county, five miles below Cahawba, half a mile from the Alabama river, has been boring an Artesian well to the depth of 619 feet, in doing which thirteen different kinds of strata were passed through. At this depth the well discharged one hundred gallons per minute, throwing up large quantities of comminuted white and green sand, pyrites of sulphur, &c.

☞ The Georgia Baptist State Convention was held at Atlanta, Georgia, lately. It represented a constituency of 720 churches, and about 70,000 members while there were in the State about 483 Baptist churches not represented, having 16,000 members. It thus appears that the Baptist denomination in Georgia consists of 1,203 churches, and about 76,000 members.

☞ The Lunatic Asylum at Columbus, Ohio, is now full containing upwards of 500 patients—In fourteen years there have been admitted 2,116 patients, of which 1,036 were farmers, being more than twelve times the number of those of any other occupation except laborers, of which class there were 130. The next highest on the list is teachers, being 40.

☞ In the vicinity of Lynn, according to the Bay State, a farmer had fifteen fowls killed by lightning. The fluid struck and shivered a poplar tree near the coop, but did not from appearances, strike the coop itself. The feathers of the dead fowls had the appearance of having been exposed to a hot fire, and were badly scorched.

☞ Rumor reports that one suit has already been commenced against the New Haven Railroad Company by the surviving relatives of an eminent deceased physician, who was killed at Norwalk, for $25,000, and another by the friends of one of the deceased Boston passengers for $100,000.

☞ Mr. Raymond, now in Europe, writes home to his paper, the New York Times, a full description of a magnificent banquet given by Mr. Geo. Peabody to the retiring American Minister, Mr. Ingersoll, at Richmond, near London, on Wednesday, the 18th ult. It was attended by a large number of American guests, prominent among whom were ex-President Van Buren and Mr. Raymond himself.

☞ The only Lutheran churches in New England are one in Waldoboro', Me., and one in Boston. The one in Waldoboro' was formed by a Colony of Germans in the last century, and the one in Boston within the last three or four years. There are now about ten thousand German emigrants in New England, the most of whom are mechanics, and reside in the cities and larger towns.

☞ The Shingle trade of Chicago is enormous, amounting last year to over seventy-seven millions. The increase this year has thus far been twenty-five per cent., and it is quite safe to estimate this year's business at over one hundred millions. They are shipped to the west and south in great quantities, thus furnishing freights for Canal boats, and increasing the Canal revenue.

☞ The Pacific Railroad from St. Louis westward, has been opened to Kirkwood, a distance of thirteen and a half miles. With a few weeks of dry weather, it will be completed to the full extent of the first division, thirty-nine miles. The construction of the first link in the great railway to the Pacific has had a sensible effect upon the valuation of lands along its route.

☞ The Salt Lake mail arrived at Independence on the 26th, having encountered much snow in the mountains. Emigrating parties were first met five miles this side of Laramie, and from that point to the boundary line there had passed Kearney up to May 20th, 3348 men, 905 women 1209 children 1320 wagons, 34,151 cattle 1691 horses, 740 mules, 1200 sheep.

☞ The New York Tribune says it has the best authority for stating that the king of the Sandwich Islands has made no overtures to the Government of the United States for annexation, neither has he any notion of laying down his sceptre. It is, according to the Tribune, the foreign residents who are pushing the matter forward.

☞ The fare from Buffalo to New York, upon the Central Line of Railroad, has been reduced to $7 by first class cars and Hudson River Railroad; $6 by first class cars and People's Line of Steamboats, and $4,50 by second class cars and River boats. The first class passage to Boston is now $10.

☞ The great combined milway, carriage and foot suspension bridge, now constructing at Niagara Falls, is being pushed forward with energy, and is expected to be ready for the trains by the first of May *next*. It will be one of the most remarkable architectural works in the world.

☞ The Knoxville (Tenn.) Register states that the recently discovered copper mines of East Tennessee are proving very productive. The ore yields thirty and forty per cent. of copper, and in some cases as much as seventy per cent. Preparations are making for mining extensively.

☞ The Springfield Republican says, "the price of paper upon which newspapers are printed, has advanced fifteen per cent within the past thee months, on account of the scarcity of rags, the latter being largely retained on the backs of many of the newspaper conductors."

---

From the Northern Farmer.

## "Miner's Domestic Poultry Book."

THIS is the title of the work, which we are tired of announcing as not out of Press. There are now, June 1st, but about *twenty-five* pages to stereotype to complete the work, and then to print and bind it will require some 20 days, so there is little probability of its appearing before *July*.

When we stated that this work would be out in *January* last, we had no idea of the delay that must occur in sending the matter 180 miles, from day to day, as prepared, and then receiving the proofs of it from Rochester, some of which were actually *one week* on the way, through carelessness of Postmasters, and the printers being dependant on the speedy return of these proofs for the purpose of stereotyping the matter, and giving them the use of their types, as no printer can be expected to have types enough to set up a work with speed under such circumstances.—Then come the delay of Engravers, that was not anticipated—then an avalanche of subscribers to this paper, not expected, and a mass of correspondence that almost staggered us, as it was of such a nature that *clerks* could be of little service, and we have found it *necessary* to write *one thousand* letters with our own hand since *January* last, in answer to inquiries of Agents and others, business pertaining to the paper, or some branch in connection with it. All this has been done while we have prepared the matter for our Poultry Book, with great care, and while we have prepared the copy for our paper, while clerks were constantly calling our attention to matters pertaining to lists of subscribers sent in, that needed our aid in clearing up some unintelligible matter, or in decyphering *hieroglyphics*, or otherwise. Not an hour of recreation have we taken, nor have we been absent from our office one *solitary* hour, except on one occasion, the 1st January, and the sun has not been our only light.

We make these remarks in detail because the public are getting tired of excuses in regard to books, and so are we.

Between the publisher and us about one thousand copies have been paid for in advance, at least two thousands engaged, and the purchasers are clamorous for their books and justly too. We believe that the man does not live who would not be satisfied if he knew the exact state of things. No delay has occurred on our part necessarily but the work now seems to "hang fire," in Rochester, owing to the delays in [illegible] and returning proofs. The labor of stereotyping is slow always.

But, gentlemen, though we say it the book will be, in the number of its illustrations, the largest amount of practical matter, and in fine type and neat execution, ahead of any other work on Poultry ever published. It will certainly contain at least ONE HUNDRED fine portraits of fowls, and other cuts, that have cost from $700 to $800; (we had not made a complete estimate, when we put the cost at $500,) and it will contain double the practical matter that is contained in any other work on the same subject. The pages are larger than those of any other work, and the type is new and mostly small, but very plain, and set compactly, so that each page contains as much matter as two pages of any work on Poultry heretofore published.

As this work will have the largest sale of any similar one in this country, it will be an object for all book dealers, pedlers, agents for this, or other periodicals, to make application as soon as the papers announce the work out, but not before, as your inquiries will be useless, because we cannot inform you what the price will be yet to dealers [illegible] will be as low as it can be, and allow the publisher to live by the business, and us our commissions for copyright. These remarks are necessary to prevent hundreds of needless applications. Geo. W. Fisher, Esq., of Rochester, N. Y., is the publisher, to whom orders for the book can be sent. The book will certainly be ready for delivery the first week in July, if not sooner.

We have submitted the proof sheets to be read by the Rev. S. Strong, of Clinton, a gentleman of well known literary taste and good judgment, and he kindly says a few words in favor of our work, which we annex:

I hereby certify that I have read a large portion of the proof sheets of Mr. Miner's new work on Poultry, in a very careful manner, and I have no hesitation in saying that it is written and compiled with great care and ability, and in a very frank and candid manner, and places all the numerous breeds and varieties before the public in the most full and comprehensive manner. The work also appears to be eminently practical, and contains nothing but matter of the deepest interest to the poultry raiser. I have also made a comparison of the quantity of matter contained in said work, and that contained in the principal American works on the same subject, and Mr. Miner's Treatise will contain in 250 pages more than is contained in any other American work on this subject extant, having larger pages and smaller type, yet not too small for easy reading. I consider it, in view of its numerous fine illustrations, to be the cheapest work at 50 cents in paper, and 75 cents bound, ever published on the subject of poultry.

Clinton, May 14, 1853. SALMON STRONG.

# Market Intelligence.

RURAL NEW-YORKER OFFICE, Rochester, June 8, 1853.

FARMERS are busy in the country, so little produce has been marketed during the week.

GRAIN—Wheat remains unchanged at $1,17@1,18. Oats are still high. Little doing in other grains.

FLOUR—There is a moderate inquiry for small lots, with a better feeling looking to future advance.

PROVISIONS—We have little change to note. Sales are limited to small parcels for immediate use. Eggs are abundant at 10c. Butter 12@14. Potatoes 25@37½. Apples $2 per barrel.

HAY—The amount in market is limited, with a moderate demand, at $10@11.

No material alteration has occurred in other marketable commodities.

### Rochester Wholesale Prices.

## NEW YORK MARKET.

NEW YORK, June 6.

FLOUR—There is little variation in market for Western and State—demand good, for good shipping brands—of Western and common State selling slowly. Canadian easier and quiet at $4,37. Sales Western canal 5,000 bbls. at $4,37 for State in store—$4,11@4,50 for common to good straight State—$4,50@4,80 for mixed to fancy Mich. and Indiana, and common to good Ohio.

GRAIN—Wheat, fair demand for prime—market buoyant—sales 2,250 bu. prime white Genesee.

Rye—scarce—1,500 bu. good Pa. 95c.

Oats—good demand—46@48c. for Western and State.

Corn—better—moderate request—60@62c for unsound; 63½@64½ for Southern mixed; 64½@65½ for Western mixed; 66@67½ for Southern yellow.

PROVISIONS—Pork better demand—market steady—sales at $15,37½@16 for mess—$13,25 for prime—$17@17,25 for clear.

Beef plenty, market dull and heavy—$8@10 for country mess—$11,50@12,50 for city mess and re-packed Chicago—$5@6,25 for prime—prime mess $18@20.

Cut meats quiet and plenty—sales 50 hhds at 5½@6c. for shoulders—8@9½ for hams.

Lard quiet and more plenty—9¾@10¼.

Butter and cheese plenty, prices steady.

## ALBANY MARKET.

ALBANY, June 6.—The offerings on 'Change this morning were again small, owing to the detention in the canal at Adams's Basin. There will be probably no boats in from beyond the break before Saturday or Monday.

FLOUR—There is only a moderate business doing; sales 1,000 bls. were made at $4½@4⅝ for common State; $4⅝@4¾ for Michigan and Ohio. Extra Genesee 5¼@5⅞.

GRAIN—Wheat, fair Genesee at $1,20. Corn, prime Western mixed is held at 61@62c. We notice sale only of 2,400 bush. at 61c. Round yellow is held at 67c. No sales of oats or rye.

FEED—The supply fair and market dull. Sales only of 800 bush. middlings at $1 ⅌ 100 lbs.

## BUFFALO MARKET.

BUFFALO, June 6.—There is no activity in the market this morning, owing to the entire absence of boats, and the only sales of flour and grain we note, outside sales for retail, are 150 bbls. Ohio flour at $4,25, one boat load white Ohio wheat on p. t.; and 3,000 bu. damaged corn at 47½c. On Saturday evening 10,000 bu. damaged corn sold part at 47½c and part at 49½c.

## NEW YORK CATTLE MARKET.

NEW YORK, May 30.—At Washington Drove Yard—Market quite active, and prices are well supported; offerings 2,500 Beeves, from the South and West; we quote the range of the market from 9@10½c. per lb. About 200 left over, the market closing dull.

At Browning's—In market 1,500 Sheep and Lambs,—all but 100 sold at prices ranging from $5,50@6,50 to $8 for Sheep, and $3@6 for Lambs.

Cows and Calves—100 offered, and all but 25 sold at from $25 to $35@55.

At Chamberlain's—Offered, 275 Beef Cattle—Prices ranging from 9 to 10½c.

Cows and Calves—75 offered, and sales at $25@35 to 50.

Sheep and Lambs—1,500 offered; all sold at from $3,25@4,50 to $5,50@6 for Sheep, and $2,25@3,50 to $5,00 for Lambs; market firm and demand brisk.

## ALBANY CATTLE MARKET.

ALBANY, June 6.—W. W. Woolford's, Bulls' Head, Washington street.

Beef Cattle—At market, 320. Prices—Extra, $8,00; 1st quality, $7,50; 2d do, $7@7,25; 3d do, $6,50.

Cows and Calves—[illegible] market. Prices from $30 to 40. Few in [illegible].

Sheep—2[illegible] Prices from $4,50, $5, $5,50 to $5,75.

Lambs—Few in market. Prices $2,50, 3 to 3,50.

Remarks—The market is firm and steady.

## CAMBRIDGE CATTLE MARKET.

CAMBRIDGE, June 1—At market, 532 Cattle, about 450 Beeves, and 82 Stores, consisting of Working Oxen, Cows and Calves, Yearlings, 2 and 3 years old.

Prices—Market [illegible] Extra, sold at $8@8,50 cwt.; 1st quality, $7,75; 2d do, $7@7,50, 3d do, $6,75; ordinary $6,[illegible]

Hides [illegible] per cwt.

Tallow [illegible],50 per cwt.

Pelts [illegible],50.

Calf Skins 10½@11c per lb.

Working Cattle—None.

Veal Calves—None at market.

Stores—Working Oxen—$88, 96, 105, 114, 125@148.

Cows and Calves—$26, 32, 33, 40, 51@61.

Yearlings—$12, 13, 13,50@14

Two years old—$32, 35, 38, 41@48.

Three years old—$43, 44, 47, 50@61.

Sheep and Lambs—976 at market.

Extra, $7, 7,50, 8@10.

By lot—$2,75, 3, 3,25, 3,50, 4@5,75.

Swine—Wholesale—still fat, at 5¼c.; hard fat at 5¾c.; shoats, 6¾@7¼c per lb.

Remarks—The whole stock at market to-day was very good, and the sales quicker than last week, with an advance in quotations. 85 Beeves from Ogdensburg, N. Y., by Mr. Hundy, and also 88 very superior Beeves from Rye, N. H., by J. Philbrick, were worthy of particular notice.

## BRIGHTON CATTLE MARKET.

BRIGHTON, June 2.—At market 575 Beef Cattle, 35 pairs Working Oxen, 40 Cows and Calves, 1,000 Sheep and 1,400 Swine.

Prices—Beef Cattle—A large number of very fat cattle were offered, and the balance of a lot offered by N. Lynch, Esq., of Auburn, N. Y., were sold for $100 per head, probably nearly $9 per hundred. Extra, $8,25; 1st quality $7,50@8; 2d do, $6@6,50; 3d do. $5,25@5,75.

Working Oxen—Sales $85, 92, 110, 130, 165@170.

Cows and Calves—Sales $24, 29, 35, 42, 55@62

Sheep—$3.50@4,75, 6, 6,75@8.

Swine—Prime lots of Ohio shoats 7½@8¼c.; spring pigs 12½c. At retail from 7½ to 9c. for shoats, 12 to 15c. for spring pigs.

# Marriages.

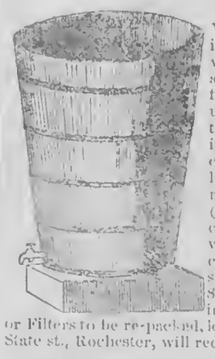
IN Lima, Sunday morning, the 29th ult., by Rev. Dr. Tefft, Mr. D. M. CALDWELL, of Lima, and Miss NELLIE S. MURRAY, of Livonia.

# Deaths.

IN Caledonia, May 31st, MARY, daughter of Job and Abigail Tyrrell, aged 23 years.

☞ The number of bills and resolves, passed at the session of the Legislature of Massachusetts, which has just closed, was 422 bills and 99 resolves. The number passed at the session of 1852, which was only one day shorter, was 322 bills and 108 resolves.

**RAIN-WATER FILTERS.**



THE use of FILTERED RAIN-WATER, for drinking and cooking purposes, has more to do with health, than most persons are aware. Hundreds of the first families in this city have used the Filter from one to fourteen years, with the highest satisfaction, and the demand increases, as their worth becomes known. As an article of luxury, as well as one [illegible] (living in Towns and sections of country,) ought to dispense with their immediate use. They can be safely forwarded to any section of country. Price, 5, 6, 8, and 10 dollars, each, according to size. Orders for Filters or Filters to be re-packed, left at J. PACKARD'S watch shop, State st., Rochester, will receive immediate attention.

JOHN KEDZIE.

Rochester, N. Y., June, 1853.

**For Sale, or to Lease for a term of years.**

A VALUABLE FARM, and genteel residence at Wellsboro', Tioga county, Pa. The homestead of late Hon. SAMUEL W. MORRIS, containing four hundred acres, will be sold entire, or may be divided into four eligible farms. Dwelling large and convenient, (16 rooms, besides halls, pantries, and garrets;) grounds well laid out, and in order; wood and ice houses; milk and wash room—running water in each of the latter.—Comfortable new tenant's house. Barn and stabling complete. Two good orchards. A fine sheep or dairy farm; will keep one hundred cows. A plank road connects with Corning and Blossburg Railroad, and the surrounding lumber region, gives also a home market for produce.

Town lots enough remain unsold to nearly pay for the property. Title unincumbered. Possession given in September, 1853. Price, twenty thousand dollars, large part of which may remain secured on the property, if preferred.

Also, several small farms, from 1 to 3 miles from the village. For further particulars refer to Editor of the RURAL; JOHN W. GUERNSEY, Corning, Steuben Co., N. Y.; JAS. LOWREY, or JOSEPH P. MORRIS on the premises

179w3.

**FOWLS FOR SALE.**

ONE pair each of Shanghais, Cochins, and Chittagongs,—ages from 9 to 12 months,—all but except the pullet of the last pair, which is pheasant colored. Her mate has eaten from a dish, 31½ inches high from the floor, on which he stood firm. Price of this pair alone $12,50; of the three pairs together, $25. As to blood, this stock is from the hands of the importer. The last pair above is out of imported fowls. DAVID ELY,

179-2t. 69 Fitzhugh st., Rochester, N. Y.

THE WATER-CURE JOURNAL.—A New Volume.—Now is the time to subscribe.—Published monthly, in a beautiful quarto. Illustrated with engravings, exhibiting the Structure, Anatomy, and Physiology of the Human Body, with familiar instructions to learners. It is emphatically a Journal of Health, designed to be a complete Family Guide in all diseases.

TERMS—Only One Dollar a Year, in advance. Address, post-paid, FOWLERS AND WELLS, Clinton Hall, No. 131 Nassau Street, New York.

"The Water-Cure Journal holds a high rank in the science of health; always ready, straight-forward and plain-spoken, it unfolds the laws of our physical nature without any pretensions to the technicalities of science, but in a form as attractive and refreshing as the sparkling element of which it treats"—*N. Y. Tribune.* [178w1]

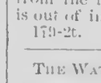
THE ILLUSTRATED AMERICAN PHRENOLOGICAL JOURNAL—Devoted to Phrenology, Physiology, Mechanism, Education, Agriculture, the Natural Sciences, and General Intelligence, profusely illustrated with Engravings. Every family, and especially all young men and women, should have a copy. Published monthly, at One Dollar a year.—All letters should be post-paid, and directed to

FOWLERS AND WELLS,

Clinton Hall, No. 131 Nassau-st., New York

Young men about launching forth upon the activities of life, and anxious to start right, and understand their course, will find this JOURNAL a friend and monitor, to encourage them in virtue, shield them from vice, and to prepare them for usefulness and success in life. The various occupations will be discussed in the light of Phrenology and Physiology, so that every one may know in what pursuit, he would be most likely to succeed.—PUBLISHERS.

**IMPROVED SWINE FOR SALE.**



THE Subscriber having been engaged twenty years in rearing and breeding swine, has finally produced a breed equal, if not superior, to any in the United States, for both pedigree and quality. They are bred from the best specimens of Leicestershire, Lincolnshire and Byfield,—the last cross from a pure Suffolk. A description of them would be—a pure white, having not a particle of black or turf on the skin, great length of body, holding their size well from end to end, small heads and legs, the pork of the finest texture, having very thin, tender skin. With regard to fattening, they are always ready to kill from three weeks old; if well fed they attain a weight of from two to three hundreds pounds at nine months old.

The numerous applications for my stock of hogs for several years past, has induced me to breed largely the past year. I have about one hundred pigs at present for sale, and shall continue to breed them at all seasons of the year, having conveniences for so doing. I will ship them to any part of the United States, by railroad or canal, carefully boxed and labeled, with sufficient feed The prices will be from ten to fifteen dollars each, at from six to ten weeks old. GEORGE SHEFFER.

Scottsville, Monroe Co., N. Y., May, 1853. [178w4]

**PREPARED SUPER PHOSPHATE OF LIME,**

BY THE UNION CHEMICAL WORKS, L. I.

**HOYT & CO., Agents,**

*No. 231 Water Street, and 122 West St., corner of Dey St., NEW YORK.*

A FERTILIZER of the most approved quality, producing all the immediate effect of the best Peruvian Guano, with the advantage of being much more lasting in the soil.—Thoroughly tested, and found to more than realise the expectations of all those who have already tried it. The best evidence of this is the largely increased demand this season over the past year. Put up in bags of 160 lbs; barrels 250 lbs each. Buyers will please be particular to observe our brand upon each bag or barrel.

Also for sale, American and Foreign Field and Garden Seeds. English Ray Grass, Foul Meadow Grass, fine mixed Lawn Grass, White Clover, Osage Orange, &c.

178m3i.

**FERTILIZERS.**

SEYMOUR & MORGAN'S PATENT

**NEW YORK REAPER, FOR 1853.**

THE great value and importance of the *Reaper* to Grain Growers of the world, is established beyond a question of doubt. Frequent tests have been made before Agricultural Societies both in this country and in England, proving the Reaper to save in a single harvest its first cost to the purchaser, over the ordinary way of cutting grain. Probably no implement is as valuable to the farmer where any considerable quantity of grain is raised, as the REAPING MACHINE.

At the present time there are several very good Machines before the Public, and now the question arises to us—which is the best? We claim precedence for ours, considering some of the following principles embodied in our Reaper, that are essential to a Reaper and can not be found in any other Machine; which enables us to offer to the farmers of the United States a

**Superior and Perfect Reaping Machine,**

which, for durability, exactness of construction, perfect manner of cutting grain, ease with which it may be worked, and lightness of draught has

*NEVER BEEN EQUALLED!*

1st. The cutter bar is placed nearly on a line with the axles of the driving-wheel, and nearly opposite the driving-wheel is the ground-wheel, which being *thirty inches in diameter*, lessens the labor which has heretofore been performed in working such Machines, and does away with all difficulty in backing and turning.

2d. The knife or sickle is scalloped and in sections, which *cannot be clogged;* and in case of accident can be repaired by any good blacksmith.

3d. The man in discharging the grain stands on the *rear* of the platform, where he has his work before him and can perform it in a perfectly natural and easy manner; and also from the construction of the attendant's stand he may change his position according to the length and amount of straw cut.

4th. The new and improved combination box, containing the smaller gear, combines *great strength* and *durability*, with perfect simplicity of arrangement, preventing any displacement or twisting of the gearing; in this it possesses great advantages over any other similar Machine and so far as we know, there have been no failures in the large number made.

5th. The lightness of the Machine and mainly of the side draught or pressure, which being obviated, enables a *single team* to pass with it over uneven ground with speed and ease.

We make our acknowledgments to the farmers for that generous confidence we have labored so diligently to sustain; and encouraged by the past, we have again commenced the manufacture of a large number for 1853, which we sell under a strong "WARRANTY." The Reaper shall be well made, of good materials, durable with proper care, can cut from 15 to 20 acres per day with one span of horses, and do the work better than done by ordinary cradling, or no sale!

Innumerable certificates might be given of the great value of this Machine, but our Reaper is so well known, we deem it unnecessary. By reference to the Reports of our State Agricultural Society, on the trial of Reapers, held at Geneva, N. Y., in July last, it will be seen this Machine cut a given amount in about three-fifths of the average time of other Reapers. The following gentlemen are Agents for the sale of the New York Reaper, and any orders received by them will be filled in due season:

S G Williams, Esq., of Janesville, Wis., is our General Agent for the West, and is authorized to appoint sub-Agents, except in Ohio and Southern Indiana.

Wm Bosworth, is General Agent for the State of Ohio except a few counties. Messrs. Warder & Brokaw, of Springfield, Ohio, have the exclusive right to make and vend for Southern Indiana, north to the 10th deg. of lat. running east to the Ohio Canal, including the south-west corner of the State of Ohio.

Brockport, Monroe Co., N. Y. [175eowtf.]

E. D. HALLOCK, No. 24 Exchange St., Rochester, has been appointed sole Agent for the sale of the above Reaper, in that city. He will have a Reaper on exhibition at his Agricultural Warehouse, and will at all times be prepared to fill orders at manufacturers prices.

**S. W. DIBBLE,**

*Dealer in Allen B. Wilson's Stitching Machine.*

OFFICE, No. 8 Smith's Arcade, Rochester. This Machine works on an entire new principle, and is said by scientific judges to be THE BEST MACHINE EVER INVENTED FOR SEWING.

It is simple in its construction, not liable to get out of repair, and stitches the finest linen, cotton or woolen goods in a superior manner. Tailors, seamstresses, cap makers, dress makers, and shirt and collar manufacturers will find this to be the best Machine ever invented for their use. Single Machines or County and Town rights, for its exclusive use, for sale on such terms that the purchaser may be sure of a handsome return from the investment.

Rochester, April 15, 1853.

**Imported Horse, "Consternation,"**

WILL stand this season at the farm of the subscriber, two miles west of Syracuse and adjoining the village of Geddes. His colts and fillies are already in demand for breeding. Several have been sold during the past winter, at handsome prices, to go out of the State.

Terms.—$10 for the season, and $15 to insure; the money to be paid in advance in all cases. When a mare is insured and left at the farm of the subscriber, or regularly returned to the horse until the groom is satisfied she is in foal, a receipt will be given promising to refund the money if the mare was not got in foal. Pasturage furnished at three shillings per week. Mares to be at the risk of owners in all respects. J. B. BURNETT,

May 14. [177-tf] Syracuse, N. Y.

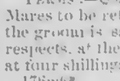
**NORMAN HORSE LOUIS PHILIPPE!**

THIS Celebrated Horse, owned by ROBERT B. HOWLAND, of Union Springs, Cayuga Co., N. Y., and bred by EDWARD HARRIS, of Morristown, New Jersey, from his pure imported Norman Stock, will be kept the present season at the following places, to wit:—On Mondays, Tuesdays and Wednesdays of each week, at the stable of R B. ROBINSON, in Farmington, Ontario county; on Thursday, at Victor village; on Friday, at Fairport, Monroe county, and on Saturday, at Egypt.

TERMS:—$8,00 for the season, and $10,00 to insure.—Mares to be returned to the Horse once a week, or until the groom is satisfied they are with foal, and to be, in all respects, at the risk of the owners. Pasturage furnished at four shillings per week. JOS. R ROBINSON.

176w6*

**MORGAN HORSE "GEN. GIFFORD."**



THIS justly celebrated horse will be kept the present season at Lodi Village, Seneca Co., New York.

Gen. Gifford received the 1st Premium in the class of Morgans at Rochester, in September, 1851, and is regarded by experienced horsemen as the best living specimen of this invaluable breed;—is a perfect model in form, a sharp gaer, and style and action unsurpassed. Terms of insurance, twenty dollars. CHARLES W. INGERSOLL.

Lodi, April, 1853. 174ws

**GREAT PRIZE MEDAL.**

THE WORLD'S FAIR AT LONDON, awarded us a MAMMOTH SILVER MEDAL for the BEST HATS.—Gents wishing the Spring and Summer style, will call. We are prepared to serve you with a superior article, and of the most becoming style.

[169-3m.] Rochester N. Y.

# Poetical.

## THE THINKER AND THE DOER.

One sits at home, with pale, impressive brow,
Bent on the eloquence of lifeless letters,
Noting man's thoughts from mind's first dawn till now,
When truth seems heaven-inspired to burst her fetters.

Another plies the force of stalwart limbs,
And keen wit, sharpened by the whirl of action;
For midnight lore no studious lamp he trims,
Curtained and muffled from the world's distraction.

Two destinies, converging to one end,
The glorious issue of all human labor,
Where in harmonious union softly blend,
The praise of God, the profit of our neighbor.

Each has his gift; the stamp affixed at birth,
That marks him for the servant of a master,
The chosen steward of his realm of earth,
The shepherd watching for a higher pastor.

Each has his crown of earthly laurels here,
Gathered and woven by the hands of mortals;
And when the spirit city's towers appear,
Dropt on his brows by angels at its portals.

Judge not which serves his mighty Master best,
Haply thou mightest be true worth's detractor;
For each obeys his nature's high behest,
The close pent thinker and the busy actor.

*Household Words.*

# Rural Sketch Book.

## THE ROYAL WHIM:
### OR THE REVENGE OF THE KING'S FOOL.

FROM THE GERMAN OF WILHELM MELNHOLD.

We are about to tell our readers a very strange event that occurred in the reign of Frederick William I., of Prussia, father of the great Frederick, and a man generally disliked on account of his rough and frequently tyrannical manner, but who was really one of the best regents of his fatherland, as he alone (and to this his son afterwards bore testimony) was the real founder of its future greatness.

This extraordinary man, who should be judged by the customs of the age in which he lived, in order to prove him extraordinary both in his errors and his virtues, had one passion which far outweighed all others—namely, love for the chase. We remember reading in his historian, Forster, that within one year he killed upwards of 3,000 patridges with his own gun, without taking the other game into account, in which the queen was the greatest sufferer, as she had to find him, according to a marriage contract, in powder and shot gratis. When there was nothing for him to shoot in his own forests, he never declined the invitations of the landed gentry to pay them a visit.

Thus it happened that—it might be about the year 1720—the rich landed proprietor, Von W———, sent his majesty an invitation to a wolf-hunt, with the humble request that he would bring his most illustrious consort with him, as the nobleman's wife had formerly belonged to her majesty's suito.

On a fine September day, then, the king and queen, with several officers and ladies of the bedchamber, as well as the court fool, Baron Von Gundling, arrived at the nobleman's ancestral chateau. On the very next day the chase commenced, and Von Gundling, who found as little pleasure in the sports of the field as the king did in the arts and sciences, took a solitary walk in the meadows, and lay down to read in the long grass.

But before we hear what happened further, we must first give our readers a description of this strange man. He was, as we have already remarked, the king's fool and had received all imaginable titles and honors, in order to afford his majesty and the court still greater sport. In fact, his Excellency, the Supreme Master of the Ceremonies, Privy Councillor, and President of the Academy of Arts, Baron Von Gundling, acquired such arrogance through his titles that nothing could be more comical than the contrast between these dignities and the indignities he had to suffer daily, even from the youngest lieutenants.—His excellency on such occasions would grow very angry—the very thing his tormentors wished—and would lay a protest before the king against a man of his rank being so treated, which naturally increased the general laughter. Through such scenes, which were in that day considered remarkably comical, our fool had become a necessity for the king and court. Besides, we may add that he was a walking lexicon, and had to give all possible explanations in the daily meetings of the so-termed "tabaks collegied." His pedantry, in fact, was the best thing about him; as for wit he possessas little as a mule; but, to make up for it, he could be as vicious and obstinate as that amiable animal.

The Baron Von Gundling, then, lay at full length in the grass, in his peculiar dress, the chief ornament of it being an immense full-bottomed wig, and in such a position that only the locks of his peruke could be seen as he moved from side to side. A gentleman who arrived rather late from the chase happened to notice it, and, taking it for some strange animal, fired point blank at the wig, but very fortunately missed it. His excellency sprung up immediately, in the highest indignation, and cried out—

"You vagabond rascal, how dare you ——"

The gentleman, however, when he perceived that the strange animal must necessarily belong to the royal suite, did not want to reply, but ran off at full speed to the neighboring forest. The baron, however, was not satisfied with this, but as he saw a man plowing at a short distance from him, he called out in his arrogant manner:

"Come hither, man!"

The reply he received was,

"I have no time or inclination to do so; but if you'll speak civilly, I may."

His excellency was not accustomed to such an answer; he therefore walked towards the impudent plowman with upraised stick, and was about to apply it to his back, when he noticed that it was the clergyman of the village, whom he had seen the preceding evening at the nobleman's chateau. The baron, therefore, lowered his stick, and contented himself by punishing the clergyman with his tongue.

"How can he be such an impertinent ass? Does he know who I am?"

"Oh, yes! he's the king's fool."

His excellency trembled with rage, and raised his stick again; but on measuring the sturdy pastor from head to foot, and seeing no help near, he let it fall for the second time, and merely uttered the threat:

"Just wait, my fine fellow. I'll tell the king you pretend to be a pastor, and yet go out plowing."

The clergyman replied, quite calmly—

"My gracious master will probably remember that Cincinnatus plowed too, and he was a dictator, while I am only a poor village pastor."

"Yes," the baron said, after inspecting his coarse and peasant-like dress; "but when Cincinnatus plowed, he did not look like a common peasant."

"I am certain he did not look like a fool," the clergyman replied, as he drove his oxen on.

This was too much for the baron, and he rushed away towards a peasant he saw approaching, vowing vengence on the impudent pastor, whom he determined to ruin on the first opportunity.

He was very glad, then, to find in the peasant a most determined enemy to the clergyman, who complained bitterly of his sternness, and of the fact of his compelling him to make up a quarrel he had carried on very successfully with his wife for several weeks.

Our fool was clever enough to see that this anecdote would not be of any service to him in trying to injure the pastor with the king, he therefore answered, most pathetically, "but the pastor was perfectly in the right; that could do you no harm!"

"Well that's very true," the peasant replied, "especially as he's getting old, and can't carry on as he used; but I'm sure when his son takes his place—a fellow like a church steeple—he'll break all our bones for us. For that reason, if the matter were left to me, I wouldn't choose him for our clergyman; for if the patron is to beat us on work days, and the pastor plays the same game on Sunday, when will our backs find time to get well?"

Gundling now listened attentively, and his plan was soon formed, when he learned that the pastor's son would return from Halle, in a few days to preach his trial sermon on the next Sunday, as the patron had promised him his father's living. He therefore quitted the peasant with a mocking smile, and made some pretext for visiting the sexton, to make further inquiries in the matter. The latter confirmed the story, and gave his opinion that the young master must be at least six feet two in height, and as straight as a poplar-tree.

"Wait!" Gundling murmured between his teeth, as soon as he again reached the street; "we will put a blue coat on this young fellow, and that will annoy that vagabond preacher." He therefore returned to the chateau, where he looked up a captain of his acquaintance, whom he took on one side, with the hurried question, "How many fellows have you already got?"

To understand this question, our readers must know that the king, at every review, requested each commander of a company to present his new recruits to him. If the poor gentleman had less than three he fell into partial disgrace; and so each captain, about review time, which was close at hand, tried to procure a few young men by any method, legal or illegal, but especially those particularly tall, for the king had a peculiar delight in such soldiers.

"Woe is me! I've but one," the officer replied, "and he's only a journeyman tailor."

"Well, then," Gundling replied, "you can get a journeyman clergyman of six feet two."

"Well, that's no tremendous height, but still it's better than nothing."

The captain then requested an explanation, and both discussed the measures by which to get hold of the clergyman's son.—They soon agreed that the officer should feign illness when the king departed. Gundling would remain with him as company; few soldiers would be secretly procured from a neighboring town, and the young candidate taken away *nolens volens* by the ears, and transported to the next garrison.

In the meantime, the king and his suite followed the chase on the next day with their usual ardor. It so happened that two ladies in attendance on the queen, tortured by *ennui*, followed the windings of the stream, which led them from the nobleman's garden into the open fields. One of them, Wilhelmine Von B——, was a young and charming creature, and was evidently attempting to cheer her companion, who was silent; and not near so charming. In consequence there was a deal of laughing, which might have been heard at some distance off, and might have led to the conclusion that the old, though still ever new, story of marriage and love was being discussed by the ladies. They had gradually wandered some quarter of a mile from the village, when a wolf, probably disturbed by the beaters, and which they at first took for a dog, ran towards them, regarding them with a look which they interpreted:—"This little darling I'll make my breakfast of, and the other little darling I'll leave on that bed of forget-me-nots till supper time."

The poor girls had not in the least expected such a bridegroom, and stood petrified with fear as soon as they recognised the animal, for they possibly did not know that a wolf, in the summer of autumn, would attack nobody, and that the Isegrim who fascinated their eyes was, probably, as much afraid of them as they were of him. The silent young lady sobbed out a masculine name—we presume that of her love—while the charming one, after recovering from her first terror, looked round on all sides for assistance.

Suddenly a carriage made its appearance from a branch road, drawn by two horses, in which a young and handsome man was sitting. Both ladies cried out together in joyful surprise when they perceived this unexpected assistance, and the wolf immediately ran off, and took up his station some distance from them.

"You have saved us from death," the charming Wilhelmine said, as she approached the young man, who immediately ordered the coachman to stop, and leaped from the carriage. After begging, in the style of French gallantry, to have his doubts cleared up as to whether he looked upon nymphs or hamadryads, or actual mortals, and all possible explanations had been furnished him, he presented himself to the ladies as the son of the old pastor, and just arrived from Halle, in order to act as curate to his father. The young man, whom we will call Carl, then invited the ladies to take seats in his vehicle, and thus return to the chateau.

The ladies quickly accepted this invitation and Carl had the pleasure of lifting them into the lofty carriage, in which he also took his seat, exactly opposite the fair Wilhelmine, who, however, was cruel enough, for some time, to look every way but at him. At length, when he began to speak of Halle, where he had been several years "Famulus," at the house of Freylinghausen, she turned her eyes with pleasure towards him, for she was well acquainted with this poet, and became so eloquent that her companion blushed, nudged her repeatedly, and at length whispered in her ear, "Ah, mon Dieu! he's not a nobleman." Wilhelmine, however, paid no attention to her, and as the young man was very well read, and recited several of Freylinghausen's newest poems, the time passed so quickly, that they stopped before the rectory almost without perceiving it. Here all the family assembled round the carriage, and wished to embrace their dear relative; but this he declined, and first presented his fair companions, who were immediately invited into the rectory, which the silent one at first declined, but the other immediately accepted.

After the first stormy salutation, the old clergyman clasped his hands, and commenced the hymn, "Praise God for all his gifts!" in which the whole family joined; among them our friend Carl, with such a splendid tenor voice, that the young lady could not refrain from saying, after the hymn was ended:

"If you would do me a real favor, you would sing me that song of Freylinghausen's which you recited to us on our road here."

This request was so flattering that Carl could not refuse to comply with it. He therefore sang, as solo, the song, "My heart should feel contented," without the least idea that, in a very short time, not merely all his consolation, but all his good fortune, would originate from this song.

The charming Wilhelmine was highly delighted when he had finished the song; and the two ladies took their leave, on the earnest persuasion of the silent one of the two. Carl politely accompanied them to the neighboring gate of the chateau, where they parted with mutual compliments.

The young man felt for the first day or two as if he had lost something necessary to his existence; but as the difference of rank between himself and a lady of the royal suite seemed an insurmountable obstacle, he soon forgot the strange adventure, in which he was materially assisted by the composition of his trial sermon, which he was to preach the next Sunday before his patron and the congregation. In the meanwhile, however, the king and his suite had returned to Berlin, while Gundling and the captain remained behind to carry out their treacherous scheme. The captain pretended to be suffering from a frightful attack of gout, and had secretly ordered a corporal and six men to come on the ensuing Sunday night from the neighboring garrison of G——n, as he had learned that their king's host intended to pay a visit at a gentleman's house some thirty miles off, as soon as the candidate's sermon was ended, and would not return for a week. During that time they expected to have the young recruit so securely hidden away, that any reclamation would be unavailing; and besides, the king's adjutant, who attended to all military affairs, was the captain's cousin. Gundling, after his usual fashion, rubbed his stomach with both hands, as he thought of the pastor's terrible despair at the loss of his beloved son.

As soon as the anxiously desired Sunday arrived, both gentlemen went to the overcrowded church; the captain, as he hypocritically told his host, to return thanks for his sudden and fortunate recovery, but in truth, to have a nearer look at his young recruit, whose height he was delighted with, and paid Gundling repeated compliments for his discrimination. The poor young man gained complete approbation from his patron and the whole parish, and even Gundling, after the service was over, approached the pastor, and treacherously praised his good fortune in having such a son. We must say, that the captain, to his credit, was not guilty of such hypocrisy in this case.

At a late hour in the evening, which was both stormy and cold, the sound of arms and a loud knocking was heard at the door of the parsonage. The door was at length opened by the unfortunate Carl, with the words:

"Who are you, and what do you want at this unseasonable hour of the night."

"We want you!" the captain exclaimed, as he sprang forward, and seized the young man by the arm. "You must come with us, and change your black coat for a blue one."

We may easily imagine the terror of the wretched man, who, only partly dressed, was standing speechless before them, when his old father, who had heard this conversation, rushed out of bed, and interposed between them. He, too, was unable at first to speak through terror, when he perceived in the moonlight the soldiers, and among them Gundling, who burst into a loud laugh on seeing the father's agony. This insult restored the old man to consciousness, and crying, "You villainous Judas!" he rushed with clenched fists at the baron. Carl, however, interposed; but as the old man could not be calmed, and the confusion and cries had become general, for the mother and sisters had joined them, the young man repeatedly begged to be allowed to speak; and when he gained permission, he addressthe following question to his father:

"Do you believe our Heavenly Father is aware of my fate, or not?"

At this all were silent; but when the question was repeated the old man replied:

"Why do you ask such a question? How should He, who knows everything, not be aware of your fate?"

Well, then," the son calmly replied, "if you believe that, you must not forget that 'all things work together for good to those who love God.' I love him, and willingly yield to my fate; and will only dress myself, and then be ready to follow the captain."

"No!" the latter replied, "you must come directly. *Allons*—march!"

All ran after the unfortunate man, crying to him, and striving to retain him, but in vain. Father, mother, and sisters were driven back by the butt-ends of the muskets.

"He will not be frozen," the captain cried, before getting out of the village, and then he'll put on his accoutrements."

We will not attempt to give any description of the condition of the sorrowing family, as a soldier's life in that day was not merely the most disgraceful, but also the most wretched on earth; and many a father, had the choice been left him, would sooner have seen his son in his coffin than in the colored coat.

*(Concluded next week.)*

The following question is now being debated by the Tilletudlem Lyceum: "Which will soonest make a person wealthy—attending to his own business, or letting other people's alone?"

If we steal thoughts from the moderns it will be cried down as plagiarism: if from the ancients, it will be cried as erudition.

It sometimes happens that a man has no enemy more bitter than the person who has in vain tried to corrupt him.

Examples do not authorise a fault. Vice must never plead prescription.

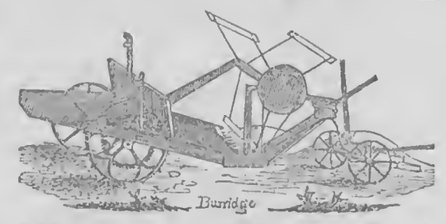
## ANSWER TO ENIGMA, &c., IN NO. 23.

Answer to Charade—Bass, Invent, Bavara, Lemon, Edward, Bible, Stand.

Breeders of Improved Stock, and all who have Domestic Animals for sale, will find the Wool Grower and Stock Register the best medium of communication with those most interested in Sheep, Cattle, Horses, Swine, Poultry, &c. It is published monthly—is the only American journal devoted primarily to Wool and Stock Growing, and kindred matters—and has a general and increasing circulation throughout the Union. On the 1st of July ensuing, a cover of 8 pages will be added to the work, when the publisher will be enabled to recommend Advertisers, whose favors have heretofore been declined for want of space. Those who wish to avail themselves of the advantages of 16 pages are informed that the terms of advertising are $1 per square (ten lines, or 100 words) for each insertion. Advertisements for the July number should be forwarded on or before the 15th of June.

Address, D. D. T. MOORE,
Rochester, N. Y.



Manny's Patent Adjustable Northern Illinois
REAPER AND MOWER.
First Premium Machine for 1853.

Awarded the First Premium for Mowing and the second for Reaping, at the N. Y. State Fair, in the great trial at Geneva, N. Y., in July, in competition with eleven other machines; awarded a Silver Medal at the Ohio State Fair, for the best Reaper and Mower, and received the highest award at the Vermont and Michigan State Fairs, for the best Reaping and Mowing Machine.

The true merit of this Machine has given it a great triumph over all others, and being a perfect combination of Reaper and Mower, it comes to the farmer with double value, and it is clearly demonstrated to be the only successful combination of Reaper and Mower. As a Mower, it is as simple and perfect as though constructed expressly for mowing; and as a Reaper, it is as simple and perfect as if constructed for reaping only. All the change that is necessary from one plan to the other, is to insert or remove a loose platform.

Machines warranted to cut all kinds of grain as well as can be cut with a scythe, and to cut flax and millet, also to gather clover, timothy and flax seed, and to be well built and of good materials. This machine will cut from ten to fifteen acres per day, with two horses, and one person to tend it when mowing, and two persons when reaping. The cutting apparatus is made perfect by means of a double edged sickle, and double guards, as fully tested the last two years, and it is connected with a joint, so as to adjust itself to uneven ground, and by a level at the driver's seat, it can be raised when moving along, to cut from one inch to two feet from the ground. All side draft against the team is entirely avoided. The machine will turn square corners, and turn square about, either way. Over three hundred of these machines were in use the past season, all of which gave perfect satisfaction.

The machines are manufactured at Hoosick Falls for the State of New York, and I will have them delivered to any part of Western New York where ordered. Price of machine, where made, $125. Address Gen. R. Harmon Wheatland, Monroe Co., N. Y.

The machine is for sale by D. R. Barton, Rochester.
173-tf R. HARMON, Agent.

Important to Farmers
PORTABLE MILL.

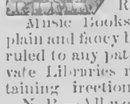
[From the Ohio Farmer, December 2, 1852.]

Ross' Improved Patent Conical Burr Mill Stones.—Our readers will many of them remember that Ross' Portable Burr Stone Mill took the First Premium at the Annual State Fair, held in this city a few weeks since.—This admirable invention must commend itself to every one who has witnessed its operation. In the first place it is easily portable, simple in structure, does not easily get out of order, and does its work with great rapidity and perfection. It may be used for grinding the coarsest food for cattle, or the finest meal for family use. It is also well adapted for grinding wheat, rye or buckwheat. It is indeed a perfect grist mill in miniature, and we would advise every farmer, if possible, to procure one. The expense of one of these mills, with the apparatus for horse power, can not be very great; or a number of farmers might club together and procure one, which would be sufficient for all.

Mr. Ross is, we believe, a resident of Rochester, N. Y.

N. B.—Any further information relative to the Conical Mill can be obtained by letter, post-paid, or by calling at the factory of CHARLES ROSS,
2d story Phenix Building, Aqueduct-st.,
151-tf opposite the Arcade, Rochester, N. Y.

MARSHALL'S BOOK BINDERY,



BURNS' BLOCK corner of State and Buffalo street, over Sage & Brother's Bookstore, Rochester, N. Y.

Music Books, Pamphlets, Periodicals, &c., bound in plain and fancy bindings; old books rebound; Blank Books ruled to any pattern, and bound to order; Public and Private Libraries repaired at short notice. Packages containing directions for binding, punctually attended to.

N. B.—All work warranted, and done at low prices.
April, 1852. [122tf] F. H. MARSHALL.

Sweet Potato Plants.—The Subscriber is now prepared to furnish these plants at $1 per hundred, at his residence, in West Macedon, or at J. P. Foote's and C. F. Crosman's Seed Stores, Rochester. They can be sent by Railroad or Canal to almost any part of the State, safely. All orders should be accompanied with the cash, and addressed (post-paid) to I. W. BRIGGS,
178tf West Macedon, Wayne Co., N. Y.

Money to Loan on Bond and Mortgage, on improved farms. L. A. WARD,
[169m6.] 36 State St., Rochester, N. Y.

MOORE'S RURAL NEW-YORKER:
A WEEKLY HOME JOURNAL,
For both Country and Town Residents.

PUBLICATION OFFICE,
Burns' Block, corner State and Buffalo Sts.,
Rochester, N. Y.

TERMS, IN ADVANCE:

Two Dollars a Year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

Terms of Advertising

One Dollar per square (ten lines—100 words, or less,) for each insertion,—*in advance*. ☞ The circulation of the New-Yorker is much larger than that of any other newspaper published in the State, out of New York city. Only a limited space, however, is devoted to advertisements, and some preference is given to those most appropriate—such as the cards and notices of dealers in Agricultural Implements and Machinery,—Horticulturists and Seedsmen,—Booksellers and Publishers,—Inventors, etc. All orders by mail should be accompanied with the cash.

It is our aim to accommodate as many as possible, brief advertisements are preferred. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

THE WOOL GROWER AND STOCK REGISTER.

This is the only American Journal primarily devoted to the interest of Wool and Stock Growers, and should be in the hands of *every owner of Domestic Animals*. It is ably conducted, published in the best style, and finely illustrated. Each number contains a careful Review of the Wool and Cattle Markets, and much other *useful* and *reliable* information which can be obtained from no other source. The Fifth Volume commences with June, 1853.

Terms:—Fifty Cents a Year; Five Copies for $2; Eight for $3; Eleven for $4. Back volumes, bound in paper, at 40 cts. each; cloth and gilt at 75 cts.; three for $1.

Published monthly, in octavo form. Specimen numbers sent free. Money, properly enclosed, secures it.

Address D. D. T. Moore, Rochester, N. Y.

# MOORE'S RURAL NEW-YORKER.

VOLUME IV. NO. 25. ROCHESTER, N. Y.—SATURDAY, JUNE 18, 1853. WHOLE NO. 181.

MOORE'S RURAL NEW-YORKER:
A QUARTO WEEKLY
Agricultural, Literary and Family Newspaper

CONDUCTED BY D. D. T. MOORE,
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter—interspersed with many appropriate and handsome engravings—than any other paper published in this Country.

☞ FOR TERMS, &c., see last page.

## Rural New-Yorker.

### Progress and Improvement.

### ASHES AS A MANURE.

Wood ashes, both leached and unleached, within the last few years, have become better appreciated for the purposes of manure, so that it may scarcely seem necessary to urge upon farmers their value or the advantages of their application. Yet, it is the province of the Agricultural Press to give "line upon line, and precept upon precept," to bring forth "things new and things old" for the seasonable consideration of its readers, that in the hurry of actual operations nothing which tends to increased productiveness, may be forgotten or neglected.

As a manure for grain and grass lands of a dry soil, we have at various times given experiments showing their value, especially in dry seasons. In one case leached ashes were applied to a dry sandy soil, at the rate of sixty-six bushels per acre, at an estimated expense of $6,25. It was then in grass, and, with a portion of the same field unmanured, was cultivated for five years in different crops, and the difference carefully noted. The increased product fairly attributable to the application was equivalent to $20, and the fifth year showed an equal difference in favor of the ashed part with the first, so that we have no reason to suppose that the effects of the ashes were nearly exhausted. Other instances of like character have been frequently noted, and in no case are they of less marked result, as proving the value of ashes on soils which need their ameliorating influence.

The immediate benefit of ashes is most perceptible, according to SPRENGEL, on leguminous plants, such as lucerne, clover, peas, beans, &c. As a top dressing to grass lands, it roots out the moss and promotes the growth of white clover. Upon red clover, its effects will be more certain if previously mixed with one-fourth its weight of Gypsum. Ashes should not be applied in large quantities to thin, poor soils, unless vegetable matter is added at the same time, as the effect is too stimulating and exhausting. In this respect they act like lime, and the same rules should be followed in their application.

Leached ashes produce nearly the same effect with the unleached, but a larger quantity is required. They are of too valuable a character to be suffered to remain unemployed, as they have been—remaining in large heaps on the sites of old asheries in many places in the country. Soils on which sorrel grows need them very much, as a corrector of the acidity which such a growth indicates.

As an application to the corn crop, ashes have been found to be of much value. As a top dressing in the early stages of its growth, it causes the plants to start vigorously—and to hold that vigor until the roots attain size and strength to seek over a larger portion of the soil, the elements needed.—Let not this source of fertility be neglected, and let further experiments be made in its use.

---

A WELL stocked meadow, after standing three years, should be thoroughly plowed up and planted in potatoes. The inverted sod will go far to supply the lack of a proper dressing of manure.

### COL. SHERWOOD'S SALE OF SHORT-HORNS.

As previously advertised, a portion of Col. J. M. SHERWOOD'S herd of Short-horns was sold by auction on the 8th instant, at his residence near Auburn. The weather was remarkably fine, and the company in attendance respectable in number and character—including prominent breeders and farmers residing in various sections of the country. Among those present we observed Col. L. G. MORRIS, Pres't of our State Ag. Society: FRANCIS ROTCH, of Otsego; B. P. JOHNSON, of Albany; S. P. CHAPMAN, of Madison; Maj. and J. B. BURNET, E. MARKS and WM. FULLER, of Onondaga; Messrs. J. JOHNSTON, SWAN and SWABY, of Seneca; W. H. SOTHAM, of Livingston; L. F. ALLEN, of Black Rock; Messrs. GAGE and MARTIN, of Ontario, and many other stock breeders and friends of improvement.

The stock was in fine condition, and showed to the best advantage—giving evidence of extra attention. The prices realized, as given below, must be highly remunerative and satisfactory. Considering the scarcity of, and consequent increasing demand for, good stock throughout the country, we were not surprised at the result of the sale, though many may consider the prices announced extravagant. The "signs of the times," or rather the *realities*—vide the scarcity of good grazing and dairy stock, and the largely remunerative prices of beef butter, and cheese—more than indicate that stock breeding, grazing, dairying, etc., will prove most profitable, in favorable localities, for some years to come. Indeed we believe those who devote proper skill and attention to the rearing, fattening, &c., of live stock, will realize quite as good dividends for five years to come, as will the generality of holders and dealers in railroad and similar "stocks."

The sale was conducted by J. M. MILLER, of New York, who is becoming somewhat celebrated as auctioneer on similar occasions, but whose popularity would not be diminished by a trifling addition of civility. We annex the

LIST OF SALES.

### INFORMATION WANTED.—THREE QUERIES.

BELOW we give the substance of three important queries, to which we are asked to furnish answers. We do so that we may have the aid of practical farmers—of men who have thought and experimented upon those subjects—whom we have never called upon in vain on such occasions. Let us hear from them now, upon the interesting matters which follow:

DEEP PLOWING *vs.* SUB-SOIL PLOWING.

EDS. RURAL:—I would like to be informed through your paper, whether a common plow turning a furrow seven inches deep, followed by a sub-soil plow running the same depth, or a large plow doing a good business ten inches deep, is to be preferred for breaking up a summer-fallow when the soil is a sandy loam six inches deep, on a stiff clay sub-soil? If the latter mode should be thought best, would it be necessary to plow more than once? Any information on this subject will be thankfully received by a constant reader of the Rural.—*Manchester, N. Y.*, June 5th, 1853.

REMARKS.—Land like this, overlying a stiff clay, would be much benefited by the use of a sub-soil plow, going to the depth of at least sixteen or eighteen inches; more, we think, than by plowing ten inches deep with a large plow, and turning up four inches of the clay to the surface. If our correspondent tries the sub-soil plow, we hope he will also try the other plan, and report the results. Will those who have experimented in such cases, give us their opinion on the subject? Deep plowing in some shape, is especially needed by such a soil.

BUCK-WHEAT AS A MANURE.

MESSRS. EDITORS:—I wish to submit a few inquiries through the medium of your columns, in relation to Buck-wheat as a green crop for manure. How much should be sown per acre? Would it have any influence in mellowing a stiff, hard soil?—Would a good crop of Buck-wheat turned under, be equally valuable with a similar growth of Clover?—W., *Phelps, N. Y.*, May, 1853.

REMARKS.—About one bushel per acre is the proper quantity of Buck-wheat for sowing. We have never observed or experimented upon it, when employed as a green manure. Prof. MAPES says, that as a green crop for plowing into old organic matter to impoverished soils, Buck-wheat may be sown to advantage. Three growings and plowings may be made in one season, thus adding largely of vegetable matter to the soil. Ninety per cent. of the dry matter of Buck-wheat and its haulm, is composed of such constituents as are received from the atmosphere, while with deep plowing it will bring up from the sub-soil the inorganic constituents which are required by the surface soil, and its subsequent decay, after being plowed under, render these additions of great value. It should never be raised on apple orchards.

We rather trust to Clover plowed under for the improvement of the soil, than to Buck-wheat; and so we believe would most farmers, especially as preparatory to the Wheat crop. Will those who have tried this plant as a green manure, furnish us the result? It is a subject on which many are seeking light.—EDS.

BARN-YARD MANURE FOR SUMMER FALLOW.—WHEN AND HOW SHOULD IT BE APPLIED?

MR. MOORE:—Will you inform me thro' the RURAL, of the best or most economical way of applying common barn-yard manure to summer fallows? By common yard manure, I mean that where hay, stalks and straw are fed to the stock, and where the cleanings of the stables are thrown also.—We have a yard of such manure, which we intend to apply to a fallow for wheat. Our fallow we want to plow two or three times, to kill the thistles. The first time we want to plow very deep, to fetch up some of the sub-soil for the ameliorating effects of the sun, air and rain through the summer; and to take out all the stones that obstruct plowing. Some recommend drawing out such manure, and piling it in the field; letting it remain there until the last time plowing, when it should be plowed in shallowly, or spread on after the last plowing, and worked in with the cultivator and harrow.

Now, as to the expense of applying, it is quite evident that to haul out, spread and plow in immediately, is cheaper than to haul and pile, and then haul again before it is applied to the soil, and by the former course the manure would be as thoroughly incorporated with the soil as by the latter.

What I want to know is whether the manure plowed in at the first time plowing, and as deep as we want to plow, and then turned up again to the surface at seeding time, will do the wheat crop, and the following crops of clover, as much good as to pile the manure and let it lay through the summer and apply it in the fall just before seeding. We have had some good articles on the saving and applying of manure, in the RURAL; but an article on the subject above referred to, would be very gratifying to your friend.—R. S., *Baldwinsville, N. Y.*

REMARKS.—We believe the general practice is to apply the manure in autumn. We hope our correspondent will try both ways and report, and also that we may hear from some of our thorough farmers on the subject. It seems to us for various reasons, that application in autumn would be best in this instance. Care should be taken to prevent waste of the fertilizing properties of the manure in either case.—EDS.

### THE DIGNITY OF LABOR.

Is it dignified to labor? Can he be a dignified man "that holdeth the plow, that glorieth in the good, that driveth oxen, and is occupied in their labors, and whose talk is of bullocks?" Or she a dignified woman who "seeketh wool and flax, and worketh willingly with her hands. Who layeth her hands to the spindle and her hands hold the distaff. Who looketh well to the ways of her household, and eateth not the bread of idleness?"

Is there any dignity about all this? It is not thought so by many persons. Some seem to think that dignity consists in splendor and show, and takes up its abode only with the great ones of the world, and hence to be truely dignified, they must have a name, must occupy some distinguished position among their fellows, must be sent to the national council to legislate for them—to talk about great things and spend the people's money. The number of applications for these dignified positions are becoming very numerous of late. Much effort and money are spent to procure them. I once knew a man to pay a thousand dollars to buy a name, which the world calls dignified. But, poor soul, it never dignified him one jot, in the estimation of any sensible man. We have recently had some demonstrations of the value of this kind of dignity. Men who are so corrupt as to sell themselves, and barter the interests of their constituents, sacrifice the interests of the many, for the benefit of a few, for the more paltry gain of a few dollars, are far from true dignity.

Public opinion is becoming right upon this point. And the time is passing, when to be a mere farmer, a laboring man, and a tiller of the soil, is considered ignoble in the estimation of any sensible man. The means of information and knowledge are in the reach of all, and they are being improved by the farmer. And as a consequence his occupation is rising and will continue to rise in proportion as knowledge is increased, until agriculture as a profession takes its stand as it ought to, as the first, the most important, and the most dignified of all professions.

Though much has been done to elevate the cause of agriculture, much still remains to be accomplished. Farmers must be educated men—thinking, reading, practical men, thoroughly educated in their own particular calling. The means for this education are in their own hands, and may be improved by every farmer of common sense in the land. And, in proportion as we advance, in just such proportion will the cause in which we are enlisted advance, and not one step farther. In no profession of life is there a wider field open for thought, investigation and improvement, than in this profession. To be an intelligent, successful tiller of the soil, we need to know the elements of the soil we cultivate—the constitutional elements of the thing to be cultivated, the laws which govern vegetation, and that our labor may be directed to the best advantage.

In the rearing of domestic animals, how important is a knowledge of the relative value of the different breeds, and the constitutional habits of each, that we may select from them that kind best adapted to our particular locality, wants, &c. We should know also, the number most profitable to keep, and the kind of keeping required in order to receive the most profit from them. How important, also, is a knowledge of the relative value of the different kinds of grain and field crops to be raised, the kind of soil best adapted to the growth of each, the manures necessary, and how to be applied.—Also, a knowledge of the relative value of stock and grain growing, and what amount of each can be grown on the farm to the best advantage. All these things, together with a multitude of others, require much knowledge and study, in order to turn our efforts to the best possible account. Labor thus directed, is truly dignified, and that true dignity, and intelligent, practical farming are antagonistical, I do not believe, but I do believe, that the tiller of the soil, the producer, is Nature's own Nobleman.

Le Roy, May, 1853. C. K. W.

### CLIMATE.—NO. III.

THE change of climate, and its effects, mentioned in my former numbers, appears to have been entirely overlooked by agricultural writers. I do not recollect to have seen any allusion to the subject by any of them. Instead of looking in that direction for the causes of the failures of crops in our country, they have, quite too generally, attributed them to the ignorance and stupidity of the cultivators of the soil. It will readily be conceded that there is not the attention paid to the renovation of the soil, by *manuring* and *draining*, which the changes of both soil and climate of the country require. Judging, however, from experience acquired during a residence of nearly *sixty* years, I do not believe that even if the soil were in its original state, in the present nude situation of the country, as good crops of grain and fruit could be raised, as when the primeval forests protected the young plants and fruit trees from the effects of frost. Indeed, examples are not wanting to prove the facts to be so.

From the loss of the vegetable matters originally on the surface of the earth, the ground has become hard and compact, and the heat now penetrates to a much greater depth than it did formerly. Solid substances being better conductors of heat than those of a looser texture, stones and solid earth are therefore more perfect conducters of heat than loose earth, or sand.

The surface of the earth having become much more solid than formerly, the rain water does not so readily penetrate into it, but rapidly runs off into the ravines, speeding its way to the places of its "manifest destination" with such headlong velocity as to sweep from their foundations mills, mill-dams, and other dydraulic erections, in one common river. Formerly, the rain-water penetrated the loose and spongy soil, and kept it moist during several weeks after a heavy rain had fallen. Now, the water quickly runs off of the higher lands, leaving them, in a few hours, as dry and hard as before it fell; inundating the low grounds of our farms, and destroying the grain on them.

In consequence of the change from the former to the present situation of the country, a change has taken place in the character of the prevalent diseases. In the early settlements, fever and ague, and intermittant fevers were the principal diseases which "human nature was heir to." Now, the more acute diseases, erysipelas, scarlet fever, inflammatory rheumatism and congestive fevers prevail. No doubt a difference in the mode of living has an influence in producing the change. But I believe very much is owing to a change of the climate.

Having shown some of the disadvantages resulting from the change of climate, in a future number I propose to give my views as to the means to be resorted to, to obviate the difficulties which the farmers labor under in consequence of it. 'HIEL.

---

A GOOD CHEESE should contain all the butter of the milk as well as the curd; and in curing, the *butter should remain unchanged.*

## CONDENSED CORRESPONDENCE.

### Crops in Onondaga, &c.

In this section, there seems to be considerable complaint about crops and the extreme backwardness of the season. Our seasons are, in a word, cold and backward; and yet after all, grass never looked better apparently than it does now—at least, in this part of the country. We shall got a fine crop of hay, and have already an abundant supply of pasturage, which, by-the-by, makes butter plenty among us.

To speak in flattering terms of corn in this quarter would be exaggerating, for certainly it does not look as well as we could wish, though there is yet, I hope, time enough to mature it so that we shall get a good crop. Worms, crows, and cold springs, are our chief and most troublesome enemies in raising corn in Onondaga. We yet think that we have about as good a corn region as there is in York State, notwithstanding the drawbacks above mentioned. Cold winds, blowing from Lake Ontario, tend greatly to make our seasons late, and another thing which allows the wind to circulate more freely then formerly, is the fact that the timber in this and Oswego counties has been in the main cut off, and as a consequence the air gets a rapid motion, producing coldness, &c.

*Fruit.*—In many orchards young fruit is comparatively plenty, while in others it is scarce. As usual the curculio, or plum-weevil, has committed its deprodations, though these insects have not been quite so severe this season as they were last, and I think the reason is because we have had so much cold weather. The curled peach leaf is common, both on the glanded and glandless varieties of trees, and I am of opinion that the disease, (for it seems to be a disease,) does not help the growth of the fruit in the least; on the contrary, is is an injury to it. The cause of the peach leaf curling is attributable, no doubt, to a misdirection of the sap and to the state of the atmosphere, including cold weather, of course. We shall get considerable many peaches, however, in most parts of the county. Other crops look very well; barley, oats, potatoes, &c.—W. Tappan, *Baldwinsville*, June 11.

### A Suggestion.—Farm Histories.

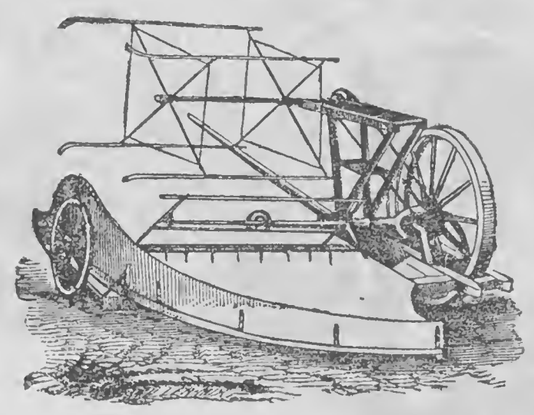
Farmers please notice! Give us a description of your farm culture for years past. Describe your farm—its soil and situation—to what crops is it adapted? Give us an outline of its history from the time it was deprived of its covering of forest trees, to the present—the crops it has produced; bushels per acre—the cultivation, &c. Let farmers do this all over the country, if friend Moore has no objections. Let us compare notes, observe differences, note objections, advantages, &c. Why would not histories of our ancient farms be as interesting as of Greece and Rome? I must believe that we would gain more real profit from their study. Come, farmer, write your farm's history; be it a dairy, sheep, or grain farm, give us your practice. I am tired of reading the changes rang upon old subjects. I want to read more of what we do do—not of what we may do. Come, report, report.—J. Sanfield, *Hill Farm, N. Y.*

### My Experience with the Potato.

It appears by 'Hiel's experience that the potato will change its color. Surely, his land must be composed of different material from land in general, for I have planted different varieties and colors in the same hill, and could produce no change in color or variety. But from the seed of the potato ball we get different colors, shapes and varieties. I have produced one variety which is very peculiar — it is a fine indigo blue, inside and out; also, after they are cooked, they are *very blue, very mealy*, and *very good*. Our only objection to them is, they are rather too blue; if their color could be changed, it would be an improvement. I find that mulching potatoes is a great improvement. I last year planted a patch as usual, only on one part of the field I covered with straw to the depth of six inches; the product was nearly double on the mulched part, and saved the labor of hoeing, and were very easily dug.—*L. N., Windsor, Ashtabula Co., Ohio.*

The Hollow Horn.—In past numbers of the Rural, I have observed different remedies for the hollow horn. But few of my cattle have been so afflicted, and whenever such a case has occurred, my never failing remedy has been to bleed in the tail, then apply about a table spoonful of spirits of turpentine, where the head joins the neck. In severe cases it may be advisable to apply it a second.—W., *Phelps, N. Y.*, May, 1853.

Le Roy Plowing Match.—The Committee of the Farmers' and Mechanics' Association of Le Roy, Genesee Co., have offered Premiums for the four best plowmen, to be contested for on the 22nd inst.



PALMER & WILLIAMS' SELF-RAKING REAPER.

We give a representation of this Machine, as manufactured by J. Ganson & Co., of Brockport, in this county. Of its merits we are unable to speak from personal knowledge, never having seen the machine in operation,—but from the strong recommendation of it by Messrs. Brinkerhoff, Root, and other practical farmers, we conclude it worthy the attention of those interested. See advertisement in this paper.

## AGRICULTURAL INTELLIGENCE.

### Report on Agricultural Implements.

The number of implements exhibited at Churchville, was not large, though many of them were of a valuable class, and excellent of their kind.

Chappell, Whiteside & Barnott, Brockport, exhibited three of the Curtis pattern plow of their manufacture, also a Cayuga Co., plow, and one of White's and one of Wright's horse-hoes. They were all finished in excellent style, and received much commendation from the farmers.

J. Ganson & Co., Brockport, had on the field one of Palmers & William's self raking reapers, which, from what could be judged without having the machine in operation promises to be a valuable improvement.—Also one of Root's three-wheeled Cultivator, too well known, and too highly esteemed to need any commendation.

Francis Van Doren, Adrian, Michigan, had on exhibition a very ingenious machine in which the Seed drill, field Cultivator and broad cast sower are combined. The machine is simple and easily operated, and has the appearance of promising well, which cannot however be determined without use.—He also exhibited a double reacting Churn, for which is claimed, as is usual on patent Churns, superiority over every other kind—a claim which many people are at liberty to doubt.

D. & D. C. Bangs of Churchville brought forward some beautiful plows of the Curtis, Lord and Mt. Morris patterns, also a Gang plow, corn cultivator and shovel plow. The work, manship was highly creditable to the manufacturers, and the plows among the best on exhibition.

E. B. Waterhouse, Parma Center, exhibited an excellent model of J. Robb's Patent Beehive, which had the appearance of possessing merit.

The Comittee have made awards as follows:

To Chappel, Whiteside & Barnett, vol. Trans, and vol. Institute; J. Ganson & Co., vol. Trans, and vol. Institute; F. Van Doren, vol. Trans; D. & D. C. Bangs, vol. Trans; E. B. Waterhouse, vol. Trans.

### Monroe County Fairs.

The fall exhibitions of the Monroe county Agricultural Society have been appointed to take place as follows:

On the west side of the river at Brockport, on Tuesday, Sept. 27th. At Rush, on the east side of the river, on Thursday, Sept. 29. An Agricultural, Horticultural, and Mechanical exhibition will be held at the Court House, in Rochester, Saturday, Oct. 1.

At Brockport and Rush, the Exhibition will be mainly devoted to farm products, animals and implements. There will be also a limited exhibition at each place of fruits, flowers and household products, under a spacious tent provided by the Society. Efficient committees of arrangement will provide all necessary conveniences for animals and implements. A liberal premium list will be offered, comprising the valuable articles grown and manufactured in the county, and no effort spared on the part of the officers and committees to develop and reward the skill and enterprise of our citizens. We invite the co-operation of all.—Every citizen by becoming a member of the Society, can render good service to the cause of improvement. Premium List, rules, regulations, and full particulars, will be published as soon as prepared.

H. C. White, Sec'y.

Cure for Cholic in Horses.—No disease among horses has so many remedies prescribed for its cure, nearly all of which have failed, as that of cholic. The following has been used in an extensive livery stable in town for many years, and never known to fail:—Oil of turpentine 2 oz., sulphuric ether 1 oz., sweet spirits of nitre 3 ounces. Give it at one dose, and repeat in two hours if relief is not afforded in that time. The first dose seldom fails.

## THE AGRICULTURAL PRESS.

### Analysis of Soils.

Without professing any intimate knowledge of the subject of Analysis of Soils — a matter concerning which we believe much more is said and written than is clearly understood by speakers and writers themselves, to say nothing of the generality of readers — we are inclined to think the following article is mainly correct. We copy from the *Boston Cultivator*:

We deem it a well-established fact that practical husbandry has derived advantage, in various ways, from the results of chemical investigation. In assuming this point, however, we are willing to admit that the benefits of the application of chemistry to agriculture have been overrated. The great point, that the success of the farmer depends chiefly on the practice of a judicious and economical system, applicable to his peculiar circumstances, is too often lost sight of. A knowledge of principles which depend on any one science, however important, must be secondary to this.

Exaggeration of the advantages of chemistry is especially conspicuous in reference to the analysis of soils. It is not denied that benefits have been realized by the process, but we think they have not been proportionate to the expectations which have been excited. Doubtless much of the disappointment which has arisen may be attributed to the quackery which has been mingled with the science of chemistry, and to the spurious and fraudulent analyses which have been made. And as quacks and impostors are generally the boldest in assumption, they often obtain a lead which, ending in disastrous results, produces a re-action detrimental to the advancement of a good cause. This has, unfortunately, been the result to some extent in regard to the analysis of soils. The undue pretension which has been set up, and the failures which have followed, have fostered the idea that the system itself is fallacious.

Prof. Jas. C. Booth, of Philadelphia, a well-known chemist engaged in the assay department of the mint, has lately brought out a paper on the "Practical Value of the Analysis of Soils," in which he takes the position that "Chemistry has not yet advanced to such perfection that these analysis can have any immediate practical value."

Without assuming to possess a knowledge of the details of chemistry, but judging only from facts brought within our observation, in regard to soil analysis, we are unable to subscribe to this conclusion. If we were to admit that in ninety-nine cases out of a hundred, the analysis of soils was of no benefit, it would not necessarily follow that the system was wholly useless. There are some questions that analysis can settle, and others that it cannot. Still, as there is less danger in adhering to practices which experience has sanctioned, than in running into the opposite extreme, the ground taken by Prof. Booth may be deemed safer than the ultra doctrines of visionary enthusiasts, or mercenary charlatans.

Prof. Booth's paper would occupy, if given in full, more space than we can devote to it; but as we desire to make a fair representation of his views, we copy the following paragraphs:

The difficulty and uncertainty attendant upon the analysis of soils that has any pretensions to accuracy, are such, as to render it valueless. Those constituents believed to be of greatest value exist in exceeding minute quantity in soils, and in an ordinary analysis they are liable to be either left out or grossly exaggerated; in either of which cases the analysis is useless, because it tells an untruth, and forms an unsound, or rather wholly unreliable basis for calculation. Let us examine more narrowly how far what may be called a tolerably correct analysis may be relied on.

Alkali, lime, phosphoric, sulphuric and muriatic acids, ammonia and organic matter are generally regarded as the fertilizing constituents. Of these sulphuric acid and lime (including magnesia) may be determined with sufficient accuracy, especially lime, which is often present to the extent of several per cent. The exact determination of chlorine (or muriatic acid) is often impeded from the accompanying organic matter, and the volatility of chlorides during evaporation. I would regard inferences drawn from the data both of sulphuric and muriatic acids as unsafe in sound farming practice. The precise amount of ammonia is ascertained with difficulty, and the amount given in analysis must be looked upon with some distrust, unless the quantity is unusally large, sufficient to overbalance the errors of analysis. We can ascertain with considerable nicety the amount of organic matter; but of what avail is that knowledge? Are the remaining, half-decomposed, rootless and organized portions those which give fertility to a soil, or is it that very unknown humus body, soluble in alkali and reprecipitable by an acid? This last idea being as yet a mere conjecture, we may summarily dismiss the determination of organic matter, as of no immediate practical utility to the farmer.

Of all the minute constituents in a soil, alkali or potash and phosphoric acid are generally regarded as the greatest causes of fertility, and yet these two are precisely the most obstinate impediments to the accurate analysis of soils. Their precise estimation is attended with difficulty under nearly all circumstances, and peculiarly so where their total amount falls below one per cent., as in soils. It may be fairly questioned whether the small fraction of a per cent. of phosphoric acid which is usually returned in soil analysis may not often be due to errors of analysis or be far above or below the true amount. I will assert that no accurate and candid chemist can declare with confidence and truth, that he has ever determined in a soil the exact amount of this pest of analyst. Our means of determing it, when in conjunction with alumina, as it is most likely to be or to become in the analysis of soils, are still avowedly imperfect in the hands of the best a alitical chemists.—There is not much more confidence to be put in the precise estimation of potassa in very minute quantity.

There is a confirmatory argument against the practical value of soil analyses, which has been so clearly set forth by Major J. F. Lee, of Washington, that I take the liberty of quoting his letter to me on the subject. "We know that, on all poor land of proper texture, the application of 200 lbs. of guano to the acre will produce fair crops of grain and roots. And this is the difference between a barren and tolerably fertile soil.—Now this guano applies only 6 lbs. potash, 24 lbs phosphoric acid, and 34 lbs. ammonia. But the acre contains 2,920,000 lbs. of soil (to the depth of a foot.) Can analysis now, or will it in any progress we may reasonably expect it to make, ascertain 1 part of potash in 500 000 parts of foreign matter, or 1 part of phosphoric acid in 150,000 parts foreign matter, or 1 part of ammonia in 100,000?" It may be answered without the slightest fear of contradiction, that such determinations are generally beyond the present power of chemical analyses. Whether they will continue so, I will presently inquire, but the argument is strong against the present value of analysis applied to soils.

From the observed effects of guano, bones, ashes, lime, and green sand, as well as from the analyses of ashes of plants, it is fair to infer that ammonia phosphoric acid, potassa and lime, possess fertilizing qualities, but the numerical measure of their value is hypothetical, if not conjectural. Much of what we term our knowledge on this subject is an idea floating in the region of hypothesis; and until it alights upon the ground, and can be handled with some degree of certainty by weight and measure, the practical farmer would do well to keep to his well trodden paths of practice, and rather be content with the accumulating experience of practical trials, than depend upon results of analysis.

Lastly—It will be observed that in the preceding part of these remarks, I have confined myself exclusively to the consideration of the practical uselessness of the analysis of soils at the present time. Can we look forward to a period when such analyses can be performed with such accuracy, expedition, and moderate cost, as to be available to the art of agriculture? I am well satisfied that such an expectation is well founded. Our assay balances can now show the millionth part of the weight placed in them, and may be still further improved. Reasoning from the past, the methods of analysis admit of almost indefinite improvements; and it is highly probable that new analytical processes will be devised of much greater power, rapidity and accuracy, than those at present known, because every journal of chemical science conveys to us monthly and even weekly notices of the progress of chemical analysis.

But although soil analyses may not be useful at present to the operative farmer, they may be made available for the advance of scientific agriculture; and for this purpose the enlightened agriculturist should lend his aid by having analyses of soils most accurately performed, not one or two, but numerous analyses of the same soil under varying conditions. Such investigations keeping pace with the advance of vegetable physiology, will the sooner tend to deliver husbandry from the thraldom of empiricism and place it under the dominion of a rational system. Besides the analysis of ashes of plants and of manures, by throwing light on vegetable physiology, will contribute to the progress of rational agriculture. Above all other things, frequent and carefully conducted experiments on manures of known composition, and close and continued observation on their effects on various crops, will accumulate a treasure of experience, from which sound theory will draw her data, and which will then react most beneficially on plants. Then may we look for a literal fulfilment of the expression, that "the desert shall blossom as the rose."

### Value of the Corn Crop.

The following paragraphs are from an article in the *Culturist and Gazette*. They are truthful and important:

The demand for corn has increased, and the price much increased, notwithstanding heavier crops are raised at less expense.—While wheat hasi maintained, in general terms, about the same price for several years, sometimes a little higher then lower again, corn has advanced 20 to 33 per cent. It now stands as a kind of indispensable article at all times, for some uses, and a very convenient substitue in place of other articles, for other purposes. For stock, in no other grain can be realized the same fattening and labor sustaining power for the same expenditure. The man who loves sweet, solid pork, of the true New England stamp, has looked as yet in vain for a substitute for the full crib of sound corn. And at this late day the the European is learning, and gladly learning, the true value of Indian corn.

The farmer has every encouragement to plant broad acres of this true American grain. In no crop is he more sure of a fair amount of grain, of a more ready sale, or what is better, a profitable return for that consumed on his own ground. The fly may cut off the wheat and the rot the potatoes, but if you do your part well, the corn crop rarely fails of giving a fair return;—but if you but half plow, half manure, half till, its growth will be slow, early frosts will be sure to catch it, and not half a crop will be obtained; everything will be halves except the expense. That will be diminshed but little if any. Through planting and hoeing after thorough plowing will cost less than half tillage after plowing, and a long, sound ear is more easily picked and husked than a short, green one.—*Culturist and Gazette.*

### Education of Farmers.

Judge Watts, President of the Pa. State Ag. Society, contributes to the last number of the *Farm Journal*, a good article with the above caption, a part of which we annex, as deserving general perusal:

It is a curious inquiry why the knowledge of agriculture progresses so slowly; and why it has yet attained so little in this country. It is a fact which we are willing to concede, that our productions are little more than one half of what they should be, and far less than what they are elsewhere; and yet we seem to be content to bide our time, and be satisfied with results, when accident or chance shall produce them, or when we shall be jostled from the "old way" by the coming generation.

More than seven hundred years before the Christian era, Isaiah prophetically speaks of a thresing machine, "Behold, I will make the new sharp threshing instrument, having teeth." And yet this intimation pointing ont almost the very structure of the machine now in so common use, was not realized until the nineteenth century; and then received with a doubting caution that well nigh dampened the experiment. The merchant has carried his enterprise into every nook and corner of the known—and I had almost written unknown world—the learned have exerted their talents to the development and practical application of scientific principles, which has given to their class an enviable place in the estimation of mankind;—the mechanic, availing himself of these developments of science, has given them form and shape to an extent which entitles them to the admiration of the world; while the farmer stands to gaze with mingled feelings of doubt and astonishment, that all the other pursuits of life whirl so rapidly past him.

What is the remedy for this admitted evil? We answer—the education of farmers' sons through the medium of an Agricultural school. We mean a school to educate boys in the art and science of farming; and unless the farmers of our State will zealously embrace this idea, and avail themselves of it, there is no hope that their condition can be otherwise improved, but by the lapse of time, and happening of accidental circumstances.

### Increasing the Wool Clip.

The *Agriculter* translates the following paragraph from the *Chronique Agricole*, (French.) It is rather hard to swallow:

About to years since a farmer named Virel, residing in the Canton of Chatelet, had one of his sheep seriously torn and injured by a dog. Although he had but little hopes of saving the animal's life, he decided on dressing its wounds, which he did with some fatty substance, mixed with the juice of certain plants. The animal soon recovered; and in about two months after, the farmer remarked that the wool on the parts which he had rubbed with his preparation was much finer and longer than elsewhere. Determined to try further experiment, he last year pulled off all the wool from the bodies of six of his sheep, and rubbed them with the preparation for three days following, and then turned them out with the others. At the end of August they were shorn, when they produced a much larger weight of wool than ordinary, and of a very superior quality. It is needless to say that he afterward extended his experiment to a greater number, and a few days since he proceeded to what he calls his spring shearing, when each of the animals yielded about five pounds of very superior wool. He calculates that by the aid of his process, he will be able to have two shearings a year, spring and autumn. The grease he uses is said to be only mutton fat, but the herbs employed are a secret. However, the paper from which we translate intimates that the principal plants used are *Sempervivum Tectorum* and *Chelidonium Majus*, which are well known to be valuable curatives.

Millet.—This is a fine crop for haying for winter fodder. Some farmers of experience say it is as valuable as an equal amount of English hay. Sow about the 10th of June, *eight quarts* of seed to the acre.—*N. E. Farmer.*

A cultivator will go over two and a half times as much ground in a day as will a plow, and therefore time and labor are economised—two very important considerations.

### New Breed of Merino Sheep.

We copy the following article from the June number of the *Wool Grower and Stock Register*:

In the report of Col. B. P. Johnson, as agent for the State of New York, at the Great Industrial Exhibition in London, the following notice is given of an extraordinary fleece of Merino Wool, shown in the exhibition, from France. Mr. J. says:—"A *Council Medal* was awarded to Jean Louis Graux, of France, for a fleece of Merino Wool of great fineness and of the best quality for combing, and possessing increased strength, brilliancy and fineness of fibre. He is described as the originator of this new and valuable quality of Wool. It was certainly a very superior sample of Merino Wool, and doubtless entitled to the encomiums passed upon it. It was different from the wool of the Rambouillet sheep and superior to it in the fineness of its fibre—samples of wool from the establishment at Rambouillet being shown in connection with the other wools from France. The breed of sheep which Mons. Graux has, will prove a valuable acquisition to this country, I have no doubt, in crossing with the Merinos and Saxons."

I have lately been furnished, from England, with the manner in which the variety of sheep from which the wool was taken has been obtained, and have no doubt it will prove interesting to the readers of the Wool Grower, not only as introducing to their notice a valuable new breed of sheep,—but as furnishing them with instructions how they may secure a new breed adapted to their wants and necessities, if need be. I am not aware that there has ever before been given so full and particular an account of all that relates to the formation of a new and distinct breed of animals as is contained in this account—and in that point of view it will undoubtedly prove of no little interest, and I hope of no inconsiderable advantage to our breeders. J.

Description of the peculiar variety of Merino Sheep of J. L. Graux, of the Farm of Mauchamp, Commune de Juvincourt, (Aisne,) France.

In the year 1828, one of the ewes of the flock of Merinos on the farm of Mauchamp, produced a male lamb, which as it grew up, became remarkable for the long, smooth, straight and silky character of the fibre of the wool, and for the smoothness of its horns: it was of small size, and presented certain defects in its conformation, which have disappeared in its descendants. In 1829, M. Graux employed this ram with a view to obtain other rams having the same quality of wool. The produce of 1830 included only one ram and one ewe having the silky quality of the wool; that of 1831, produced four rams and one ewe with the fleece of that quality. In the year 1833 the rams with the silky variety of wool were sufficiently numerous of themselves to serve the whole flock. In each subsequent year the lambs have been of two kinds—one preserving the characteristics of the ancient race, with the curled, elastic wool only a little longer and finer than in the ordinary Merinos; the other resembling the rams of the new breed, some of which retained the large head, long neck, narrow chest, and long flanks of the abnormal progenitor,—whilst others combined the ordinary and better formed body, with the fine, silky wool. M. Graux, profiting by this partial resumption of the normal type of the Merino in certain of the descendants of the malformed original variety, at length succeeded, by a judicious system of crossing and inter-breeding, in obtaining a flock combining the *long, fine, silky fleece*, with a smaller head, shorter neck, broader flanks, and more capacious chest.

Of this breed the flocks have become sufficiently numerous to enable the proprietor to sell samples of the breed for exportation. The crossing of the Mauchamp variety with the ordinary Merino has also produced a valuable quality of wool, known in France as the "Mauchamp Merino." The fine, silky wool of the pure Mauchamp breed is remarkable for its qualities as combing wool, owing to the strength as well as the length and fineness of the fibre. It is found of great value by the manufacturers of Cashmere shawls, being second only to the true Cashmere fleece in the fine, flexible delicacy of the fabric, and of particular utility when combined with the Cashmere wool, in imparting to the manufacture qualities of strength and consistence in which the pure Cashmere is deficient.

Although the quantity of the wool yielded by the Mauchamp variety is less than in the ordinary Merinos, the higher price which it obtained in the French market (25 per cent above the best Merino wools,) and the present value of the breed, have fully compensated M. Graux for the pains and care which he has manifested in the establishment of the variety. The jury, therefore, taking into consideration the quality of invention which has been superadded to the skill and industry requisite for obtaining the finer qualities of wool under any circumstances, in the development of the new variety of sheep yielding the specimens exhibited by M. Graux, recommended that the Council Medal should be awarded to J. L. Graux.

Milk and Oil for Wool.—A mixture of milk and oil for preparing wool for spinning, is now used in some of the principal English manufacturing establishments. In the United States, rectified *rosin oil* is found to be a valuable substitute for other oils for this purpose. It is afforded at much less expense, is said to answer the purpose equally well, and has less inflammable tendency than some kinds.

The Paris Society for the Protection of Animals proposes prizes to all such coachmen, grooms, drivers, conductors, shepherds, wagoners, &c., as shall have "evinced a high degree of compassion of mildness and of intelligent skill in the treatment of their animals." We should greatly rejoice to see such a society, and similar rewards, here. "The merciful man is merciful to his beast."

# Orchard and Garden.

### PARISIAN HORTICULTURAL WONDERS.

The Paris Society of Horticulture held its 24th Annual Exhibition in May, and we find in the *Daily Times* European Correspondence, interesting mention made of the show and its wonders. A tent was erected on the Champs Elysees, covering in, perhaps, two acres which is in the form of a T, and enclosing one of the stationary fountains of that park. Every thing is constructed as permanently as though meant to stand for years; and in most splendid taste and beauty. The fountain forms the nucleus of the display, and is fenced in by a little green railing, a bitumen sidewalk, a ring of the brightest possible turf, and an inner-ring of silver fir and lignum vitæ. The hard, down-trodden surface of the place has received a coating of softer soil, to the depth of perhaps a foot. In this, gravel paths are laid out, flower-pots imbedded, cherry-trees sunk; little upheavings of earth, are crammed thick with the products of our ornamental horticulture; little dells receive such plants and fruits as grow best in low grounds, where they grow wild.

All the flowers of the season, some new roses, several new pears, half a dozen varieties of apples which Nature never produced before, or never would without the assistance of art are here, and M. Chevet contributed a basket of mixed fruits, the admiration of all, and far exceeding the effort of M. Rothchild, in the same direction. M. Chevet has also ripe strawberries, fourteen of which make a pound; cherries, one of which makes two bites; and pine-apples, which drag the stem which supports them, to within dropping distance from the ground.

Art was particularly conspicuous at this exhibition. Not only in forcings, graftings, crossings, and acclimations, but the whole paraphernalia of ornamental gardening in its higher branches was here displayed.—Statues, vases, rustic seats, watering engines, flower pots,—every variety of garden utensils, and all of most exquisite materials and workmanship. Imitation fruit—imitating all the defects and wrinkles, as well as the bloom and juiciness,—show more naturally than any ever seen before.

One of the most attractive articles of the exhibition was a union of art and nature in the shape of tall, healthy rose bushes, blooming with artificial flowers. They are made of *batiste*, very fine linen cambric, and are colored by hand. The petals have that crumpled, wavy appearance peculiar to rose leaves, and the hue, pale at the edges deepens as it approaches the centre of the flower. You may dust them, wipe them, flip them, they recover at once their form, and keep it perennially. The red rose, the white rose, and the tea rose, are all beautifully imitated. It is impossible to discover the imposture till you find that the roses are without scent. This is their principal recommendation. French ladies cannot bear the odor of flowers.

"Of course," says the correspondent of the Times, "we shall soon have cambric camelias, sempiternal butter-cups, unfading dahlias, and hyacinths that shall know no sore and yellow leaf. Perhaps the commoner species will have their turn, and we shall buy calico sunflowers, gingham daisies, muslin de laine dandelions. It will, perhaps, be cheaper to get the artificial than the real flowers. The cotton and the flax-plant will produce all the blossoms you can want and the rest may withdraw."

### MY EXPERIENCE IN GRAFTING, &C.

Eds. Rural:—I find by experiment, that the Lilac *will grow*, by grafting on the White Ash. Transplant a young and thrifty tree in your door yard—let it remain a year or two, until well started, then at the height of some six or eight feet graft it with the lilac, and when in bloom it makes a very pretty ornamental tree. I find also, that the *currant*, will grow by grafting on the hard or soft maple. Transplant in your door-yard, (as directed for the white ash,) and graft with the red currant, and when ripe they look very pretty and pleasing to the passers by. Be sure and not graft until the sugar water has ceased to run, or they will fail to grow. Cut the scions from the last years growth, close to the ground, in March, and keep in a moist place until wanted.

I have several thrifty, nice plum trees in my yard, but the vexatious Curculios for a few years past have destroyed all the plums. I therefore concluded to change them into peach trees. A part of them I grafted one year ago last April, with the large yellow rareripe. They took finely; one scion grew last year to the length of five feet, and this spring looks most beautiful when in full bloom. L. N.

Windsor, Ashtabula Co. O., June, 1853

### STRAWBERRY CULTIVATION.

Almost every one who cultivates the Strawberry, I notice has fallen into two very great errors. First, of allowing different varieties to intermingle. Even many nurserymen permit this, as the plants sold by some of them abundantly prove. But in most of our family gardens different kinds are crowded so near together that their mixing is unavoidable, as soon as they begin to strike runners. Others again, mix in a few staminates with their fine bed of pistillates—instead of placing them on an adjoining bed at a respectful distance—and as an unavoidable result, the more barren staminates soon crowd the more productive pistillates out of the bed, and they thus run out. It is utterly in vain to attempt to raise year after year, large and satisfactory crops of strawberries, without a strict separation—sooner or later they will fail.

The other error, I observe, about as universally prevalent, is over-feeding, and as a consequence, an over-growth of vines and a deficiency of fruit. Large bearing vines are usually very small, and the analysis of the vines and fruit is so very different, that it can easily be seen that large quantities of rich, well-rotted manure, are not adapted to produce much fruit on their luxuriant vines.

Such highly enriched soils can be in a measure, counterbalanced by a liberal application of potash, or unleached ashes, lime and salt, for it should be remembered that nearly three-fourths of the strawberry fruit is composed of those three elements.

In all my observation, I do not discover any so general and fatal errors as those two, in the gardens of our country. Others might be named of importance, but I wish to let the mind of the strawberry cultivator rest with peculiar force on these two.

Geneva, N. Y., June 3, 1853. R. G. P.

Boiling Water for the Peach Grub.—Will friend Briggs oblige us by asking "Mary," at what season of the year she gives her peach trees that "hot bath?"—or, if it makes no difference, at what time it is applied? L. N.

### FLOWERS AND SHADE TREES.

I seldom see two people envy one another seriously about their flower-beds or shade trees. There is a kind of religious, humanizing, generous effect in loving the beautiful things of nature, that makes us love to see every body have them; while those who stake their respectability on dress or housekeeping, almost universally dislike to see others approach their standard, or rival them in their boasted sphere. This shows that learning to love the beautiful things of nature, beautifies our spirits—while priding ourselves on bright tin pans, well scoured floors, or costly furniture, disfigures our immortal part. The country house that has its shade trees, its shrubbery and flowers, has hallowed memories to win back the hearts of its wanderers, and brighten their gloomiest hours. The woman who fails to have a green spot and shade at her door, fails in one important part of her domestic mission! Her home will not be so endeared to its inmates as it otherwise would be! True, the outside decorations should chiefly belong to man's labor; but very many men will not plant a tree or flower, who could be taught to love them and add to them if some one would begin. So, girls, do not scrub and cook, and scour, until you have no time left to plant a tree or vine, and flower! Little care will suffice them when once planted; and they will do more to beautify and adorn your home than the contents of a tin pedlar's cart, polished every Saturday, until they dazzle you and outshine the neighborhood.—*Mrs. Swisshelm.*

Remedy for the Cherry Slug.—The cherry slug or snail, makes sad havoc on our cherry trees in this vicinity. I have previously found lime effectual in destroying them. Last summer I tried dry dust, taken from the ground near the tree; with a shovel make it fine, or you may scrape it from the highway when it is dry and dusty. Apply profusely, that none of the slugs escape a good covering, and my word for it, they will be minus equally as well as if you had used lime. Renew the application as often as necessary. So says A. S. Moss, of Fredonia, N. Y., in *Country Gent.*

The Curculio.—Now is the time to guard against the attacks of this insect. The best mode yet devised is to jar them from the trees and catch them on sheets, or large inverted umbrellas made for the purpose. It is not advisable to depend on washes of lime and sulphur, thrown over the fruit—they have proved ineffectual in many instances. —*Boston Cult.*

The first weeping willow in England was planted by Pope, the poet. He received a present of figs from Turkey, and observing a twig in the basket ready to bud, he planted it in his garden, and it soon became a fine tree. From this stock all the weeping willows in England and America originated.

Downing's Cement, made by dissolving Shellac in Alcohol, has never been surpassed as a shield for covering the wounds made by pruning trees. All wounds upon trees should be covered with this composition.

# Mechanic Arts, &c.

### LIST OF PATENT CLAIMS

ISSUED FROM THE UNITED STATES PATENT OFFICE

For the week ending June 7, 1853.

Henry Baker, of Catskill, N. Y., for improvement in converting rotary into reciprocating motion.

Thomas A. Dugdale, of Richmond, Ind., for improvement in washing machines.

Henry W. Hewet, of New York, N. Y., for improvement in propellers.

Wm. S. Hubbell and Amos Barrett, of Kingsville, O., for improvement in composition for treating wool.

Samuel P. Kittle, of Buffalo, N. Y., for improved door fastener.

R. W. Belson, of Philadelphia, Pa., for improvement in boilers for cooking stoves.

Oliver Ellsworth, of Hartford, Conn., for improvements in operating and locking knob bolts.

Ralph J. Falconer, of Washington, D. C., for improvement in hose coupling.

P. G. Gardiner, of New York, N. Y., for improved arrangement of quartz pulverizer and gold amalgamator.

Herman Goldsmith, Jr., of New York, N. Y., for improvement in water closets.

Leon Jarosson, of Jersey City, N. J., for improvement in painting on cloth.

Gerard Cickles, of Brooklyn, N. Y., for self-adjusting platform for ferry bridges.

Geo. W. Wight, of New York, N. Y., for improvement in screw presses for packing boxes.

Ebenezer Talbot, of Windsor, Conn., for machine for boring rock.

Julius Hornig & Ludwig Suess, of Union Hill, N. J., for improvement in artificial stone.

Hamilton L. Smith, of Cleveland, O., assignor to H. L. Smith, of Cleveland, O., and Levi Buttles and Henry A. Swift, of Ravenna, O., for improvement in paper files.

L. P. & Wm. F. Dodge, of Newburg, N. Y., for improvement in pumps.

RE-ISSUE.

Moses Pond, of Boston, Mass., for improvement in cooking ranges. Patented Feb. 25, 1853. Reissued June 7, 1853.

### PRINTING MACHINES.

Printing presses in great numbers and in a great variety of forms have been in use for a long time, but those small presses which were originally used soon after the discovery of printing, bore very little resemblance to the magnificent power-presses of the present day, but writing or printing machines, for printing one copy, as distinguished from printing presses are of modern date. The first one patented in the United States, is what is denominated the Manifold Letter Writer, the object of which, as its name indicates, is to multiply the number of copies, by once writing the original; it consisted in the use of cams operated by a series of keys whereby a horizontal lever, which hold several pens or pencils placed transversly across it, was moved in a direction to form letters upon the paper, a number of sheets corresponding to the number of pencils, being clamped in suitable frames to hold them for the purpose. The process of writing by this machine was a very slow one, but when one copy was completo, a duplicate was also at hand.

Another machine for accomplishing the same purpose was patented in 1850, by O. T. Eddy, of Boston, although the object was accomplished in a manner entirely different, and the alphabet a printed instead of a written one. This machine prints anything desired by the operator, in Roman letters, upon striking certain finger keys corresponding to the letters used. The operation of this machine, in the hands of a good performer, is about as rapid as that of House's Printing Telegraph, and nearly as rapid as the execution of writing by an ordinary penman. This machine is exceedingly expensive and quite complex, for which reason probably, it has not been extensively used. Another machine has been patented, denominated the Phonetic Reporting Machine, designed to report speeches by working changes upon a small number of keys and type, to make a variety of letters or characters. A machine which shall fully accomplish this object, is needed, as our reporters are seldom if ever able to get a full report, particularly from rapid speakers; if all the fingers and thumbs could be brought to aid in making characters, so that several characters could be made at the same time, greater speed might be obtained.

We noticed an article in the "Randolph Whig," a few days since, stating that the inventor of this Reporting Machine had one in operation in that place, and that from appearances, writing might be performed very rapidly upon it. The patent for this machine was obtained through our aid; we think it will prove successful. Engravings of it will probably appear in the Scientific American after a short time. Engravings and a description of a printing apparatus, invented by Mr. Jones, of Rochester, were presented to our readers in No. 34, this volume,—the structure and form of which are therefore understood; it is not complex, and, like Mr. Eddy's, prints the Roman letters. These constitute all the machines of this class of any notoriety, which have been brought to any practical perfection. The pen is a very ready transcriber of ideas, and whether it will ever be superseded by machinery, remains yet to be determined.—The future may be "big with wonders," great inventions and results do not surprise us, unless the modus operandi are unphilosophical or too mysterious for our credulity; in such cases we invariably take the defensive until the improvement appears in a tangible form. Our readers are pretty well aware that masked, mysterious, theoretical phenomena do not obtain encouragement from the Scientific American,—things sho'd show for themselves.—*Scientific American.*

### A CHEAP FILTER.

As efficient a filter as can possibly be constructed may be made in a few minutes by any person, and at the cost of a very few pence. Procure a clean flower-pot of the common kind, close the opening of the bottom by a piece of sponge, then place in the inside a layer of small stones, previously well cleansed by washing; this layer may be about two inches deep, the upper stones being very small; next procure some freshly burnt charcoal, which has not been kept in a damp or foul place, as it rapidly absorbs any strong smells, and so becomes tainted and unfit for such purpose; reduce this to powder, and mix it with about twice its bulk of clear, well-washed, sharp sand; with this mixture fill the pot to within a short distance of the top, covering it with a layer of small stones, or what is perhaps better, place a piece of thick close flannel over it, large enough to tie round the rim of the pot outside, and to form a hollow inside, into which the water to be filtered is to be poured, and which will be found to flow out rapidly through the sponge in an exceedingly pure state. The flannel removes the grosser impurities floating in the water, but the filter absorbs much of decaying animal and vegetable bodies actually dissolved in it; when it becomes charged with them it loses this power, hence the necessity for a supply of fresh charcoal at intervals.—*Monthly Observer.*

### THE STAMPED ENVELOPES.

George F. Nesbett, at the Tontine buildings, Wall st., the contractor for the manufacture of prepared letter envelopes, has now prepared a large quantity of them for the disposal of Government, which will be ready for sale not far from the first of June. The envelopes are cut out by an instrument worked by steam, to the number of five hundred at a single operation. The image of Washington is stamped on them in white bas-relief, and the rates of postage printed in red ink. After applying the gluten, they were counted in bundles of twenty-five and sent to Washington, whence they will find their way through postmasters to every part of the country. They are of white and buff paper, and water-lined with the initials of the Post Office Department of the United States.

About one hundred and fifty operatives, chiefly females, have been employed in the work. Special precautions are taken against forgery and the abstraction of envelopes from the manufactory, for which offences the new post office laws have imposed a fine of not less than five hundred dollars, or imprisonment not exceeding five years, or both such fine and imprisonment.—*N. Y. Post.*

### NOTHING NEW.

Our contrivances do not appear to be so very peculiar to our own age as people may fancy. Not to go back to the time of Moses (who, says Sir Edward Coke, was the first reporter, seeing he took down the Divine ordinances!) we see in the entries of John Evelyn, that the trials of the Jesuits, in his time, (1679,) were taken in *short hand.*—This writer also speaks of a *way wiser*, to operate in a coach, and declare the speed of it. He also published a plan for consuming the smoke of large cities. In addition to these, it may be observed that, in the time of the Emperor Caracalla, there was in Italy a contrivance by which fresh water could be distilled from salt water.

# Domestic Economy.

### HOW TO HEAD RED ANTS.

How to be rid of the little rascals who run out upon the China, and climb the lumps of white sugar when company is in to tea, just as if they were invited—this is *the* question with many a housekeeper. A correspondent of the Boston Cultivator says:

Several years ago, my father rented a house almost overrun with them, and they were destroyed in the following manner.—A piece of shag-bark (hickory bark) was laid upon the shelf in the pantry where they seemed to be thickest, and it attracted them—indeed it seemed more of a favorite with them than anything they could get.—The piece we had, about four inches wide and two feet long, was red with them in an hour or two, when with a sudden jar they were shaken into the fire, and the bark set as a trap for them again. In our case, this was an entire exterminator.

### POTATO SOUP.

Almost every farmer's household is fond of soup for supper. I will now write a few "home-spun" lines on making a cheap and palatable soup from the potato. I take good sound potatoes, peel and cut them in pieces small enough to be eaten with a spoon. After having them well rinsed, I boil them with enough water to leave them in a state of soup, adding salt to my taste. When they are cooked, I take about two tablespoonfuls of flour, with half as much lard, and fry it in a pan, stirring it with a spoon until changed to a brown (not black) color. I then stir it in with the potatoes, after which it is ready for the table.—Elizabeth Diehl.

Pericles was wont to say, that Time was the wisest counsellor.

# Educational.

## ATTENTION.—HOW CAN IT BE SECURED?

Both attention and thought are efforts, and the latter a most difficult and laborious effort, yet on whatever subject the mind feels a lively interest, such exertion, though unchanged in its nature, becomes delightful to indulge in. But where no interest previously exists, attention (as every schoolmaster knows,) can only be procured by terror; which is the true reason why the majority of mankind learn nothing systematically except as school boys or apprentices.

The above paragraph, the substance of which is found in "The Friend," by Coleridge, is in the main true. It is all true, perhaps, but at first glance, the declaration that "attention can only be procured by *terror*, seems scarcely warranted. Terror cannot command attention from any interest in the lesson, though it may secure a forced memorizing of it. We doubt if scholars ever learn anything systematically by means of attention excited in this way alone, but that before such learning is acquired, some means must be used to create an interest, and such an interest as will make the effort required a delightful one.

The influence of terror aside, the question, How shall a lively interest be excited and kept up in the mind of the student? is one of much importance, and worthy of the close and earnest attention of teachers.—There are many ways in which it may be answered. Emulation, curiosity, love of approbation, &c., &c., may combine to secure the attention of the scholar, but the true thirst for knowledge—the love of wisdom for its own sake—this alone can give the lively interest so desirable in a student; this alone can make the exertion of thought a delightful indulgence.

Written for Moore's Rural New-Yorker.

## COMPOSITION WRITING.

This is a branch which has been much neglected in our institutions of learning, till very recently; and at the present time, it is evident there is not sufficient interest and importance attached to it, as a branch of education.

Now methods of teaching almost every thing, have been proposed and adopted, and great improvements made, but the matter of composing, to a considerable extent, has been kept in the back ground. Our common schools have, as it were, paid no attention to the subject. Academies and colleges, of course, have given some thought to it; still, in these institutions, it has not held a place of sufficient prominence. The real teaching of it has been comparatively no teaching at all. The student is required to write something in the form of a composition, at certain stated times, and if there are very obvious mistakes, there may be a sort of correction to some of them; however, if the corrections be made, there is no very strict observance of them demanded, and not that interest excited by the teacher, which is calculated to render the task a pleasant one.

Thus we see reasons for not having more good writers at the present day. The few we have, are those who had a sort of natural talent and love for it, and, by dint of effort and determination, have tried to become masters of it without assistance from any source. There have been great improvements made in common school education—yet, there is much room to make more, and in this very thing—composition writing.—There should some good plan be adopted by every teacher. He should be convinced that it is important for scholars to be taught how to compose, in connection with other branches of study, and be able to give reasons *why* it should be done. Different teachers, of course, would have different ways of teaching, but it must be evident to all, that slate or black-board exercises, by old as well as young students, are greatly beneficial. This should be done in connection with grammatical exercises more than has been the practice of doing. These exercises should be strictly criticised by the teacher, and in such a way as to make the scholar interested.

For instance, he should be required to give a description of some object, in a single sentence, then in some other way, using different language, and from this to some other still. Thus, he is furnishing himself with a variety of words which is evidently indispensable to a good writer. A simple, or complex subject should be given, according to the age and intelligence of the scholar; or often, it might be the better way to let him select for himself. The different ways of introducing the subject should be proposed, giving the student to understand that either of them is correct—that he can consult his own taste which to use first, &c. Then, when one thing has been said of the subject, the way something else should be said in connection, ought to be explained—that it can be done by using a connective or by commencing a new sentence. Such exercises would evidently benefit old as well as young pupils. They would tend to make education more practical and consequently more useful. F.

Chili, N. Y., June 1, 1853.

## DETAILS OF TEACHING GRAMMER.

The following is one of the best common sense articles, on the subject treated, we have seen. Let every teacher read it carefully.

The words of our language, though numerous as forest leaves, may all be reduced to eight classes, Noun, Pronoun, Adjective, Verb, Adverb, Preposition and Interjection. It requires maturity of intellect to enter into the full consideration of the properties of some of these classes, but their names may be made familiar at an early day, and quite young pupils will readily distinguish and classify words that they understand.—The first ideas of grammar, then, may be imparted in some such way as this:

The Noun. Ask the little scholars to write upon their slates the names of things around them, as *desk, bench, book*, &c. Also the names of things that they have seen, as *tree, house, brook, &c.*; then after the exercise has been sufficiently varied, tell them familiarly that the names of things are called nouns; get them to select the nouns in their reading lessons, and to write long lists from memory. Tell them, too, that particular nouns, as *George, Ann, Ohio*, are called proper names, while *boy, girl, state*, and such like names are called common nouns.

The Verb. Words that express action, as *run, jump, play, strike*, from a class very easily distinguished. When these have been written a few times, the name may be told them, and the necessity of a noun and a verb to every sentence pointed out. Little sentences, as "Boys run," "Girls play" "Birds fly," may be introduced here and there, and pupils directed to write as many as they can think of. This distinction of transitive and intransitive is the only property of the verb worth mentioning at present.

The Adjective. Write some noun, as tree, upon the blackboard, and request the scholars to tell you words that describe it; as *tall, green, leafy, &c.* Then let them write as many such words as they can upon their slates. Tell them these words are adjectives, and let them use them in such sentences as "Good boys study." "Pretty birds fly," &c. Such words as *some, this, the*, and possessives, as *his, my, our*, will naturally be classed by learners with adjectives, and it is not important now to point out the distinction.

The Pronoun. Repeat such sentences as "The bird flies, and it sings," "Children are happy when they are good," and have the pupils tell you what "*it*," and "*they*," stand for. Then write as many sentences as you choose upon the black-board, and have them select the pronouns that you have purposely introduced. Show them that those words stand for nouns, and tell them they are therefore called pronouns.

The Adverb. Write on the board, "The horse runs," and have the scholars supply, *swiftly, fast, gently*, &c. Write "Mary sings," and let them supply *softly, loudly, sweetly*, &c. Let lists of these be written, and when the class of words is sufficiently familiar, call it the adverb.

The preposition. Place a book upon a slate, and ask the class where it is. Let them tell as you vary its position. "Beneath the slate," "above the slate," "beside the slate," across the slate." Call for the particular word that expresses the relation, and let them write as many similar as they can think of; as *on, in, beyond, beside, below, from, towards*. The name of this class of words will be made familiar by repeated use.

The Conjunction. Write, "William and John play." "William studies but John works." "Trees, or flowers, or fruits, can afford pleasure." Show which words are connective, and think up similar ones to increase the list.

Thus might each point be brought before the class, be illustrated and amplified; but the teacher who, after weeks and perhaps months, has led his class through such an outline, will need no assistance in carrying them through the remaining details, as Person, Gender, Number, and Case, of the Noun, and Mood and Tense of the Verb.—The matter will expand on his hands, and if judiciously managed will grow in interest as it extends. Plenty to *do*, not *learn*, and that done intelligently, should be the teacher's motto.

This course of instruction may be begun at an early age, much earlier than any book can be put into the learner's hands. Indeed, we have few books fit for beginners, our "First lines," and "Equitomes," being mere abridgments of large works, and requiring maturity of judgment thoroughly to understand. A book suitable for beginners should contain nothing but what they are to learn, and be arranged in the simplest manner possible.

When students take up the book to memorize, they should do it thoroughly.—One work thoroughly mastered lasts a life time. Its definitions will be referred to and quoted, whatever may be learned subsequently; and moreover it furnishes a standpoint from which, being master of the subject from one view, the student may look off and see what others say and think.

In conducting recitations it is best to follow the methods of the author you are using. Parsing will take up the bulk of the time you have to spare, and short lessons in the grammar, thoroughly mastered, may be the introduction to the parsing exercise. Sometimes there will be written exercises; let them by no means be neglected. If the pupils master the subject in the work they use, they will have acquired a thorough practical knowledge of grammar.—*Rinez.*

JOHN GODFREY SAXE.

John Godfrey Saxe was born at Highgate, Franklin County, Vermont, on the second day of June, 1816. From nine to seventeen he worked on his father's farm and went to school. Wishing then to study one of the liberal professions, he entered the grammar-school of St. Albans, and, after the usual preparatory studies, the college at Middletown, Conn., where he graduated Bachelor of Arts in the summer of 1839.

He had no reputation while at college either as a writer or speaker, but was considered a fine scholar, especially in the languages, a very pleasant fellow, and the best talker in the place. He wrote nothing at college, nor until several years after he had graduated, when he was in apparently unpropitious circumstances, viz., in the holy bonds of matrimony, and the tedious study of the law. Among his college friends was Thos. B. Thorpe, now of New Orleans, the author of many admirable western stories. To him Saxe has addressed a rhyming epistle full of college reminiscences:

"Ah those were memorable times,
And worth embalming in my rhymes,
When at the summons
Of chapel-bell, we left our sport,
For lessons most uncommon short,
Or shorter commons."

After alluding to Thorpe's talent of drawing and painting, whereby

"People very thin and flat,
Like aldermen, grew round and fat
On canvas-backs."

he says:—

"Ah, we were jolly youngsters then;
But now we're sober-sided men,
Half through life's journey:
And you've turn'd author too, I hear,
And I, you'll think it very queer,
Have turn'd attorney."

Saxe's first movement toward the "turning" alluded to was to read law at Lockport, in the State of New York, and afterward at St. Albans, his old school-place. In 1843 Saxe was admitted to the bar at St. Albans, and commenced practice as an attorney.—When he was twenty-five he began to write verses, and his first published not only related the story of his life at that time, as is the case with the poems of all true poets, if the world has the art to read them aright; but demonstrated that a new poet had appeared, and indicated the school of verse in which he was to be most successful. The reader will bear in mind the law-studies of Saxe; imagine, if he pleases, his want of practice; and then proceed to read and enjoy "The Briefless Barrister."

"THE BRIEFLESS BARRISTER.

"An attorney was taking a turn,
In shabby habiliment dress'd;
His coat it was shockingly worn,
And the rust had invested his vest.

"His breeches had suffer'd a breach,
His linen and worsted were worse;
He had scarce a whole crown in his hat,
And not half a-crown in his purse.

"And thus as he wander'd along,
A cheerless and comfortless elf,
He sought for relief in a song,
Or complainingly talk'd to himself.

"'Unfortunate man that I am!
I've never a client but grief;
The case is I've no case at all,
And, in brief, I've ne'er had a brief!

"'Tis not that I'm wanting in law,
Or lack an intelligent face,
That others have cases to plead,
While I have to plead for a case.

"'O, how can a modest young man
E'er hope for the smallest progression,
The profession's already so full
Of lawyers so full of profession.'

"While thus he was strolling around,
His eye accidentally fell
On a very deep hole in the ground,
And he sigh'd to himself, 'It is well!'

"To curb his emotions he sat
On the curb-stone the space of a minute;
Then cried, 'Here's an opening at last!'
And in less than a jiffy was in it!

"Next morning twelve citizens came,
('T was the coroner bade them attend,)
To the end that it might be determined
How the man had determined his end!

"'This man was a lawyer, I hear,'
Quoth the foreman who sat on the corse;
'A lawyer? alas!' said another,
'Undoubtedly died of remorse?'

"A third said, 'He knew the deceased,
An attorney well-versed in the laws,
And, as to the cause of his death,—
'T was no doubt from the want of a cause.'

"The jury decided at length,
After solemnly weighing the matter,
'That the lawyer was drown'd because
He could not keep his head above water!'

After the "Briefless Barristor," and one or two smaller poems, came "Progress," a satire, which was spoken before the associated alumni of Middlebury College in 1846, creating a decided sensation. It was published in New York shortly after its delivery, and immediately became popular. It has been more quoted than any satire printed in the last twenty years. "In skillful felicities of language and rhythm," says Dr. Griswold, "general clear and sharp expression, and alternating touches of playful wit and sharp sense, there is nothing so long that is so well sustained in the one hundred and one books of American satire." In 1847 he wrote "The New Rape of the Lock," and in 1848 "The Proud Miss M'Bride."—For the last seven or eight years he has been practicing in the courts, writing verses occasionally, attending to the interests of his party in that part of the world—for Saxe is something of a politician—editing "The Burlington Sentinel," running for the office of district attorney, which he was talented and popular enough to gain, and writing and delivering college and anniversary poems. In this last item of business he has done more service than any other man, reciting more verses and oftener, than all our lecturers together, Park Benjamin, perhaps, excepted.

For his personal appearance we refer to the portrait prefixed to our article: we can vouch for its thorough correctness; but it gives no idea of one peculiarity of Saxe—how indeed could it?—of his height and robust build. In his epistle to the editor of "The Knickerbocker," he thus describes himself:

"I am a man, you must learn,
Less famous for beauty than strength;
And for aught I could ever discern,
Of rather superfluous length.
In truth 't is but seldom one meets
Such a Titan in human abodes,
And when I stalk over the streets
I'm a perfect Colossus of roads!"

With the exception of Holmes, and perhaps Lowell, Saxe is the only one of our writers who has cultivated comic poetry with any degree of success. Bryant, who is one of the best judges of metres in America, and not wont to talk carelessly, says of "The Proud Miss M'Bride," that it "shows a great deal of comic power, and uncommon facility of versification." There is not much story about the poem, which relates the ups and downs of a retired soap-boiler and his only daughter, the proud lady; but what there is, is cleverly managed; and the hits at the follies and frivolities of fashionable life are very pointed and funny. American aristocracy, that "thing of shreds and patches," comes in for a good rub:—

"Of all the notable things on earth,
The queerest one is pride of birth
Among our 'fierce democracie!'
A bridge across a hundred years,
Without a prop to save it from sneers,
Not even a couple of rotten peers—
A thing for laughter, flouts, and jeers,
Is American aristocracy.

"Depend upon it, my snobbish friend,
Your family thread you can't ascend,
Without good reason to apprehend
You may find it wax'd at the further end
By some plebeian vocation!
Or, worse than that, your boasted line
May end in a loop of stronger twine,
That plagued some worthy relation!"

One admirable point about all Saxe's verses is the careful way in which they are finished: you will not find a single nonsensical or slovenly line in his book; no slip-shod English, and no rough edges and loose ends. He is plain and straight-forward in his senses, and terse and smart in his style of saying it. His heroic couplets are, we are inclined to think, the best of their kind that we have yet produced in America, and quite lately, with other of Saxe's measures, they have had much currency given them by the English and Scotch papers. "The Rhyme of the Rail" is much copied in England, and sung everywhere. As the didactic theory, the theory of utility, is all the rage now, somebody may ask, What is the use, and what the *aim* of Saxe's verse? To which we answer, He has none, beyond that of writing as well as he can, on such themes as happen to occur to him, and for his own amusement in his leisure as an editor and attorney. Verse is but an incident, almost an accident of his life. And when we remember the quantity of stuff which is being produced by those who make it the *business* of their life, we cannot but wish for more "accidental" verse, like that of John Godfrey Saxe.

The utilitarian effect of Saxe's satire cannot fail to be important. He lashes the contemptible pretensions of our own "high life," and whips, right and left, old current follies. The times call for such scourging. —*National Magazine.*

Must a man "cut the legs and back of a poor boy with a rattan till the blood flows in many places," because corporal punishment is necessary to preserve order in schools? We believe that the rod should be used, like mercury in medicine, as the resort when milder measures fail; but careless salivation and brutal whippings ought both to be made penal offences.

## SABBATH EVENING.

BY DIANTHA.

'Tis Sabbath evening—blessed hour,
Go seek thy chamber—kneel and pray;
Acknowledge there His sovereign power,
And thank Him for this happy day.
Mother, with thy weight of care,
To thy chamber—leave it there;
Mourner, grieve not thus alone,
Kneel and say—"Thy will be done."

O glorious Sabbath! foretaste sweet,
Of that eternal day of rest.—
When, bending low at Jesus feet,
Pure, heavenly joy shall fill each breast.
Spotless robe, and crown of gold,
Glories that could ne'er be told;
Aged traveler dost thou see?
"Lift the heart and bend the knee."

Go muse thou on the hours long past,
Thy wanderings—tremble—kneel and pray;
The light of day is fading fast,
So fades, perchance, thy life away.
Youthful child, and child of years,
Maiden fair, with smiles and tears;
Manhood, from the world away
Seek thy chamber, kneel and pray.

Recall thy mercies—O! how few,
Have been back traced to Him who gave;
See! through the gloom a form I view,
And sovereign mercy—stoops to save.
Murd'rer in thy deep, dark cell,
Pause, ere justice rings thy knell;
Mortals old, and young, and gay,
Poor and wretched, kneel and pray.

For the Rural New-Yorker.

## DEATH.

Change is imprinted on all things terrestrial. Yet why should man shrink from his destiny, and fear the embrace of death. Is he to be annihilated? Certainly not. Is he to be lost? Not if he has lived the life of the just and laid up treasures where thieves break not through nor steal. Then why the unmanly fear? Is it in education? It ought not to be.

To the good, Death is a kind and ministering angel;—a friend that knoweth no favors or distinctions, and who performs his kind offices with the same cheerfulness to all. His benevolence, though repulsed, is, nevertheless, unbounded—and given alike the begger in the street, and the king robed in ermine and canopied by gold. He unbinds our burdens, eases our pains, unfetters the soul from its earthly chains and carries the freed spirit away to the land of immortal bliss, where it may drink from the true fountain of knowledge, eat from the sure tree of life, and bathe itself in everlasting floods of celestial sunlight; and with hosts of kindred spirits roam the illimitable regions of Heaven and study the profound works of the great Creator.

What man, then, possessed of an enlightened knowledge, should fear to meet the embrace and be wafted to everlasting happiness. True, the society of friends is cheering, and the good things of this world are enticing to the heart, but these should be used as good gifts for the better preparation of ourselves for the hereafter to come. Then can we say to those friends who still linger behind:—Lo we go to join those who are already in the better land; be ye ready also to meet us there when Death shall summon you hence. Weep not therefore for me, for my gain is beyond estimation.

No, no, we should not so cling to this earth, and grovel for its transient enjoyments, but should strive to so fit ourselves for the existence hereafter, that death shall find us purified, our garments washed in the "blood of the Lamb," and therefore spotless from all stain. So should we welcome death with a becoming embrace, putting off the garments of mortality to be robed in the habiliments of immortality. T. E. W.

## THE APOSTLES' WAY OF PREACHING.

The Apostles did not go thus round about to persuade men by long argumentation.—They took man as he is, a sinner; with this they went directly to his heart. They compelled him to turn his eyes inward, and look at the prison there; to behold how dark it was; to hear the mutterings of wrath; to see sin, the jailer, with his chains, and bars, and instruments of torture; and then they would open the door of hope, and let in the soft, still light from above, and man would look out through it, and lo! the revealed glories of the heavens and the splendors of the Cross;—then man saw and felt the truths of the Word of God. This was the plain apostolic way of dealing with man; and let this wise age learn that it was and is the truly philosophic way. Man must have a sense of what sin is before he can perceive the harmony of the great doctrines of condemnation under it and restoration from it, and learn their adaptability to his desires and needs.—*R. H. Dana.*

He that is good, will infallibly become better; and he that is bad, will generally become worse, for vice, virtue and time, never stand still.

Greatness stands upon a precipice; and if prosperity carry a man ever so little beyond his poise, it overbears and dashes him to pieces.

# Miscellaneous.

## WINDOW GLIMPSES.

BY H. W. PARKER.

### THE SEASON.

No more the tulips hold their torches up,
And chestnuts silver candelebra bear.
The Spring, dethroned, has left her festive cup
Of honey-dew, and other blosoms flare
To light another feast with tinted glare.
Summer has ta'en the scepter, and the trees
In low obeisance bow their weight of green;
The locusts bloom with swarms of snowy bees
That make the fragrant branches downward lean;
Each snow-ball bush with full-blown moons is hung,
And all around, like red suns set'ing low,
Large peonies shed a burning crimson glow,
While—worlds of foliage on the shoulders swung
Of Atlantean trunks—the orchards darkly grow.

### THE DISTRICT SCHOOL.

Yon crowded school—small beer too closely pent—
Bursts from the open door with sudden pop,
And drowns the street in foaming merriment.
They run and roll, they tumble, jump and hop—
A bodied shout, each bubble of a boy—
Each girl a rainbow-colored, dancing drop
Of careless, happy, loving, laughing joy!
Bright children! through your freer lips and limbs,
Nature for her great gladness finds a vent,
While we, encased in custom's iron whims,
And raised on manhood's stilts, are children still,
But feel the boy within us slowly die,
As slowly grows the angel there—until
We fledge our wings, at death, to seek the freer sky.

[*New York Tribune.*

## THE HOUSE WHERE I WAS BORN.

JOHN FOSTER, in his essay "On a Man's writing Memoirs of Himself," truthfully remarks that "places and things which have an association with any of the events or feelings of past life, will greatly assist the recollection of them. A man of strong associations, finds memories of himself already traced on the places where he has conversed with happiness or misery. If an old man wished to animate, for a moment, the languid and faded ideas which he retains of his youth, he might walk with his crutch across the green, where he once played with companions, who are now laid to repose probably in another green spot not far off. An aged saint may meet again some of the affecting ideas of his early piety, in the place where he first found it happy to pray. A walk in a meadow; the sight of a bank of flowers—perhaps even of some one flower; a landscape with the tints of autumn; the descent into a valley; the brow of a mountain; the house where a friend has been met, or has resided, or has died; have often produced a much more lively recollection of our past feelings, and of the objects and events which caused them, than the most perfect description could have done; and we have lingered a considerable time for the pensive luxury of thus resuming the long-departed state."

These sentiments were powerfully impressed upon my mind, a few months ago, on revisiting my natal home after years of absence. On one of these mentally clear days, when we can look back the farthest, I repaired to the old house in which I was born—now in the hands of a stranger and standing a little way off the homestead.—The front door faces the west instead of the south, as it did when the house was originally built; and, on entering it, I was at first troubled to make things within look natural. Indeed nothing could be made to appear just as it did when *last* I stood within the old mansion: but memory and imagination were active, and events which occurred there in my early youth, were re-called, and persons who have been in the grave for long, long years, stood before me. As I entered, I saw my grandfather sitting by the front door, with the noontide beams of the sun sleeping on the leaves of his open Bible, as it lay across his lap; I saw my grandmother spinning flax, and heard her singing a pious hymn as she sat, with her glasses on, beside the wheel: the good man who came from Virginia, when I was but five or six years old, and died of the consumption at my father's house, was still lying in the bedroom, with his heavenly look on, and waiting patiently for the angel to come with a shining robe; little ANN MARIA, who died at the age of one month, was sleeping in death, as she slept thirty years ago; and my mother was in her robes, just as she reposed on that beautiful yet sorrowful morning in June, 1826! How true it is, as the author of "A Journal of Summer Time in the Country,"* remarks, that, "affection has its pure crystal, never-stained, or broken, except in death. The hand and the mirror fall together. On this bright surface of love's remembrance, we behold our friends with the clearness of natural faces reflected in a glass; and we see them in connection with the parting, closing scene. That room may have crumbled before the hammer, or the saw—its furniture may be scattered or destroyed—but for us all things remain as they were. Not a chair has been removed; not a fold of drapery has been rumpled by time."

Both of my grand parents died and were buried in my absence; hence, they were not associated with death; but all those whom I had seen shrouded in that house, appeared before me in waxen stiffness, as I entered the rooms wherein they breathed their last. By the power of imagination I called them back to life and to the dear old house again, and could almost hear them speak to me. In a brief period, however, the vision faded—they were gone once more; and I was left alone to challenge the Past for his Jewels:

"Thine, for a space, are they—
Yet shalt thou yield thy treasures up at last;
Thy gates shall yet give way,
Thy bolts shall fall, inexorable Past!

All that of good and fair
Has gone into thy womb, from earliest time,
Shall then come forth, to wear
The glory and the beauty of its prime.

They have not perished—no!
Kind words, remembred voices, once so sweet,
Smiles, radiant long ago,
And features, the great soul's apparent seat.

All shall come back; each tie
Of pure affection shall be knit again;
Alone shall evil die,
And sorrow dwell a prisoner in thy reign."

Buffalo, N. Y., June, 1853. J. C.

## THOUGHTS ON A BIRD'S NEST.

WITH what wonder and admiration do we witness the skill of the bird in forming its nest; each species having a way of its own, and a way that it understands even better than he who has learned a trade until he is called a perfect master of his art. It is a pleasant sight to see them so busy and active, some bringing hair and wool, others twigs and moss, and twining them so nicely, with no tool but the beak, and yet carrying their little structure forward to completion exact in every part and serving admirably for the purpose intended. Man with the nicest implements that art can furnish, could not thus easily form such a house. Neither has the bird any teacher save the innate power that directs it.

Although there is so much that is beautiful about the nest, our curiosity is no less excited by the inmates of this wonderful habitation. The constant watching and tender care manifested by the parent bird, for the welfare of its little ones, are truly surprising, and here a great lesson may be taught those with human understanding, in the duties of parental affection! O, that some who profess to be guided by reason might look here and learn, for the heart is too often pained by the exhibition of feelings, in which there is not manifested even a moiety of the tenderness shown by the bird.

If an idle boy come near their treasure what an anxiety is manifested in their flutterings and chirpings, whilst they lose not the sight of the objects of their care till fears of danger are past. With what courage are their timid breasts fired, to defend their little one's when danger really assails them. Self-preservation is then lost sight of and their whole energy and stratagem exerted to defend their nestlings.

And it is amusing when they have become so much fledged that the nest will no longer hold them, and when they are tempted to make their first experiment at flying.—Perhaps their first attempt dashes them to the ground where they remain long in fear, but re-assured by the encouragements of the parent birds, they are induced again to make the venture, when in a little while their efforts are crowned with the highest success, and they are enabled to rejoice their parents in their glad soarings elsewhere, and the home which for a time was the centre of all their bird-joys, is now the "deserted bird's nest." E. H. W.

## AN AMERICAN HABIT.

AND—speaking of green leaves—I have been vexing myself to-day over a thumb-and-finger nationality that we have. The laborers, at work upon our cottage grounds during the earlier season, have gone to and fro without damage, intentional of what did not belong to them. They respect one's property in a tree as well as in a wall or a door. But, with the opening season, the mechanics—Americans, of course—have resumed *their* labors on the unfinished building; and the marks of their passings in and out are very different. They board among our neighbors around, and, either way, from the public road, on the river or the village side, the approach is through a long avenue of fir-trees. You may track them—(seeing any day whether they have gone to dinner or not)—by the broken twigs of fresh-green tassels upon the ground. They never pass near one of my beautiful hemlocks or cedars without refreshing the memory of their American thumb and finger as to its being a free country—breaking off a branch, slapping it once or twice against the log as they walk along, and throwing it away. If it were grass, and only missed in a crop—or if their "bosses" milked them when they got home I should say nothing. A trespass on pasture at least benefits the owner of the cow. But, the disfiguring of trees, whose every graceful spray, from the ground up, is part of an outline of proportion—destroying what nothing can restore, from a mere non-recognition of any man's property in more than the fuel of a tree—is a thumb-and-finger Fourth of July which I must venture to wish somewhat abated. The young gentlemen, of course, intended no especial annoyance to me. I would have spoken to them on the subject—but they would have understood it as an economy of fire-wood. The liberty they take is part of a national habit of mind. It is a pimple on the nose of the republic, which must be reached by physicking through public opinion—not so rudely picked by any one individual as to make a pock-mark memorial of his name.—*Home Journal.*

## DRAW IT MILD, CHARLEY!

IT is not worth while to be extravagant; every unnecessary adjective gives you one more chance to be wrong; every expletive may demand of you a troublesome explanation. Just state the facts in simple, quiet English, and leave your hearer to draw his conclusions, and utter the exclamations.

Draw it mild, Charley! rather understate than overstate it. better write a postscript with an additional incident to-morrow, than have to retract and apologize for saying too much. Libel suits grow out of too strong language. Charges of slander are based on superlatives. It is not worth while to make every wound a "bleeding wound," every push a "violent thrust," to make a kick of a hint, nor to "kill a man dead."—You need not make all your villians "outrageous villians," your rascals "unmitigated rascals," your hypocrites "consumate hypocrites." Better leave a little something to say next time. The best of hens won't lay without a nest egg. Leave one good sounding superlative in the inkstand when you are done.

Draw it mild, Charley! it takes less time, it saves invention, it will spare you some hours of headache, and, in the course of half a dozen years, the price of a copy of Webstor's Dictionary.

Draw it mild, Charley! greater things are to happen than have yet transpired—richer murders, more desolating fires, more destructive floods, more terrific accidents, more tremendous explosions than have yet transpired. Don't pile up *all* the agony to-day. You know how careless we are, how reckless of life, how rash in purpose, how headlong in rushing onward. We have whole volumes yet to write of horrible details and startling developments, if we live to watch this crazy old world much longer. Don't let us waste all our tri-syllabics before the steam is fairly up. We've got to hurl a deal of indignation at evil-doers yet—let us be a little choice of our ammunition. Our fulminations will be required in many quarters yet, let us not waste our thunder.—Don't make too "awful a conflagration" out of a burning shanty—you know that all this wicked world is to be burned up yet.—*N. Y. Times.*

## DISCIPLINE OF SOLITUDE.

IT is interesting to notice, in the Scripture biographies, what part solitude has in the formation of character. Abraham goes forth from his home and dwells in a strange land, a pilgrim and a sojourner. Thus his faith grew by living alone with God and he became the father of all them that believe. Jacob pursues a lonely journey on foot, and sleeps in the field all night! heaven is opened to him, and he vows a vow, which with the vision, decides his whole future life.—Moses is a shepherd; he leads his flock to the backside of the desert, and there he comes to Horeb, and sees the burning bush, and by his solitary meditations and communion with God, is prepared for his eventful work. Elijah was the son of the desert. David had great experience of caves, and dens, and holes in the rock. David's son, and David's Lord must be driven into the wilderness, and be with the wild beasts before he can preach. Four, at least, of the apostles were taken from the solitary and contemplative employment of fishers; and John the Baptist lived in the wilds of Judea, on the locust and wild honey, covered only with the shaggy cloth of camel's hair, so different from any fabric known to us by that name, his waist girded by no belt from Tyre, or scarf from Persia, but with a leathern thong.

There, in those wilds, from the commencement of his youth till near the age of thirty, his parents, who were well stricken in years before he was born, being in all probability dead, he lived apart from the busy paths of men, not perhaps, as a hermit, for there were scattered dwellings in the wilderness. He was, however, conversant with the rough face of nature, in her tangled thickets, dark, pathless woods, overhanging cliffs, swollen streams, diversified, all with spring tide beauty, and summer's glory and autumn's melancholy, and winter's rage; his courage nurtured by darkness and storms, perhaps by conflicts with wild beasts, and by solemn awe with which solitude and stillness sometimes oppress even the bravest spirit.—*N. Adams.*

AN American is as capable of strong muscular effort, and as enduring as a European; but he does not get half the *pleasure* from his vigor. Indigestion and nervous diseases sour the life of half our people. The evil increases too; and the probability is, the health of the nation is degenerating. These facts are notorious in Europe, and our sharp, worn American faces are known everywhere. There is much disease and bodily weakness among the poorer classes of the Old World; but as classes enjoyung equal comforts, it will be found that the Americans are confessedly inferior in robust health. The dyspepsia which so curses our whole population is comparatively unknown among the older nations.—*Bruce's "Home Life in Germany."*

# For the Ladies.

## THE BEAUTIFUL.

WE have this charming composition, from a volume entitled "Revelations of the Beautiful," by EDWIN HENRY BURRINGTON.

Walk with the Beautiful and with the Grand,
Let nothing on the earth thy feet deter;
Sorrow may lead thee weeping by the hand,
But give not all thy bosom thoughts to her:
Walk with the beautiful.

I hear thee say, "The Beautiful! what is it?"
O, thou art darkly ignorant! Be sure
'Tis no long weary road its form to visit,
For thou can'st make it smile beside thy door:
Then love the Beautiful.

Ay, love it; 'tis a sister that will bless,
And teach thee patience when the heart is lonely;
The angels love it, for they wear its dress,
And thou art made a little lower only:
Then love the Beautiful.

Sigh for it!—clasp it when 'tis in thy way!
Be its idolator, as of a maiden!
Thy parent bent to it, and more than they;
Be thou its worshipper. Another Eden
Comes with the Beautiful.

Some boast its presence in a Grecian face;
Some, on a favorite warbler of the skies;
But be not fool'd! where'er thine eye might trace,
Seeking the Beautiful, it will arise:
Then seek it every where.

Thy bosom is its mint, the workmen are
Thy thoughts, and they must coin for thee believing:
The Beautiful exists in every star,
Thou makest it so; and art thyself deceiving
If otherwise thy faith.

Thou seeth Beauty in the violet's cup:—
I'll teach thee miracles! Walk on this heath,
And say to the *neglected flower*, "Look up
And be thou Beautiful!" If thou hast faith
It will obey thy word.

One thing I warn thee: bow no knee to gold;
Less innocent it makes the guileless tongue,
It turns the feelings prematurely old;
And they who keep their best affections young,
Best love the Beautiful!

## A PERFECT WIFE.

EDMUND BURKE, the distinguished orator, presented to his wife on the anniversary of their marriage, his idea of a "perfect wife," which is supposed to be a true portrait of Mrs. Burke. It is certainly a lovely picture, worthy of the pen of the author of "The Essay on the Sublime and Beautiful." The following passages are extracts:

The character of ———.

She is handsome, but it is beauty not arising from features, from complexion, or from shape. She has all three in a high degree, but it is not by these she touches a heart; it is all that sweetness of temper, benevolence, innocence, and sensibility, which a face can express, that forms her beauty.—She has a face that just raises your attention at first sight; it grows on you every moment, and you wonder it did no more than raise your attention at first.

Her eyes have a mild light, but they awe when she pleases: they command like a good man out of office, not by authority, but by virtue.

Her stature is not tall, she is not made to be the admiration of everybody, but the happiness of one.

She has all the firmness that does not exclude delicacy—she has all the softness that does not imply weakness.

Her voice is a soft low music, not formed to rule in public assemblies, but to charm those who can distinguish a company from a crowd; it has this advantage—*you must come close to her to hear it.*

To describe her body, describes her mind; one is the transcript of the other; her understanding is not shown in the variety of matters it exerts itself on, but in the goodness of choice she makes.

She does not display it so much in saying or doing striking things as in avoiding such as she ought *not* to say or do.

No person of so few years can know the world better; no person was ever less corrupted by the knowledge.

Her politeness flows rather from a natural disposition to oblige, than from any rules on that subject, and therefore never fails to strike those who understand good breeding, and those who do not.

She has a steady and firm mind, *which takes no more from the solidity of the female character than the solidity of marble does from its polish and lustre.* She has such virtues as make us value the truly great of our own sex. She has all the winning graces that make us love even the faults we see in the weak and beautiful in hers.

## MEN AND WOMEN.

In days not far distant men found their excitement, and filled up their time, in violent bodily exercises, noisy merriment, and intemperance. They have now, in all but the very poorest classes, lost their inclination for those things, and for the coarse pleasures generally; they have now scarcely any tastes but those which they have in common with women, and, for the first time in the world, men and women are really companions. A most beneficial change, if the companionship were between equals, but being between unequals, it produces what good observers have noticed, though without perceiving its cause, a progressive deterioration among men in what had hitherto been considered the masculine excellencies. Those who are so careful that women should not become men, do not see that men are becoming what they have decided that women should be,—are falling into the feebleness which they have so long cultivated in their companions. Those who are associated in their lives tend to become assimilated in character. In the present closeness of association between the sexes, man cannot attain manliness unless woman acquire it.—*Westminster Review.*

## HE IS SO AMIABLE.

A BEAUTIFUL girl, gay, lively and agreeable, was wedded to a man of clumsy figure, coarse features, and a stupid-looking physiognomy. A kind friend said to her one day, "My dear Julia, how came you to marry that man?"

"The question is a natural one. My husband, I confess, is not graceful in his appearance, nor attractive in his conversation. But he is *so* amiable! And *goodness*, although less fascinating than beauty or wit, will please equally at least, and it is certainly more durable. We often see objects, which appear repulsive at first, but if we see them every day, we become accustomed to them, and at length not only view them without aversion, but with feelings of attachment. The impression which goodness makes on the heart is gradual; but it remains forever. Listen, and I will tell you how I came to marry my husband.

I was quite young when he was introduced for the first time into the house of my parents. He was awkward in his manner, uncouth in his appearance, and my companions used often to ridicule him, and I confess I was frequently tempted to join them, but was restrained by my mother, who used to say to me in a low voice, 'He is so amiable!' And then it occurred to me that he was always kind and obliging; and whenever our villagers assembled together at our fetes and dances, he was always at the disposal of the mistress of the house, and was profuse in his attentions to those whose age or ugliness caused them to be neglected.—Others laughed at his singularity in this respect, but I whispered to myself 'He is *so* amiable.'

One morning my mother called me to her boudoir, and told me that the young man who is now my husband, had made application for my hand. I was not surprised at this, for I already suspected that he regarded me with an eye of affection. When I recollected his ill-favored looks and his awkwardness, I was on the point of saying, 'I will not wed him,' and I blushed for him, which is a strong proof that I even then felt interested in him; but when I recalled the many excellent traits in his character, and dwelt on his benevolent and good actions, I dismissed the idea of banishing him from my presence. I could not resolve to afflict him, and I whispered to myself, 'He is *so* amiable!'

He continued to visit me, encouraged by my parents, and cheered by my smiles.—My other admirers one by one left me, but I did not regret their absence. I repeated the expression, 'He is *so* amiable,' so often that it seemed to me to carry the same meaning as 'He is so handsome.' I loved him, and took him as my husband.

Since then I have not only been resigned to my fate, but happy. My husband loves me devotedly, and how can I help loving him 'He is *so* amiable.'"

There is something exceedingly touching in this love which beauty entertains for goodness, and there is no longer a doubt that some women love from a feeling of benevolence, or tender compassion, regulated by reason. Such an affection will know no change. It has a firm basis, and will endure through life.—*Exchange.*

## THE SOCIETY OF LADIES.

THE following pertinent remarks occur at the close of an article on the dangers of "College Life," from the pen of a New York clergyman, which appeared in the New York Times:

The society of ladies has done much for me all my life long; and it was the salutary, softening influence of such associations that with God's blessing, restrained me from many an excess into which I might otherwise have been led while receiving my education. It is a bad sign when a young man has no relish for such company. Whatever be a man's station in life, whether higher or lower, public or private, he will become a better man, and escape many a disaster, if he will listen in due season to the voice of the intelligent and the refined among the other sex. Not only do they generally excel us in their nice perception of the proprieties of life, and in their tender sense of duty to both God and man, but they are equally before us in their instinctive facility of forseeing evil before it is upon us, and of wisely discerning the character and motives of men.

It was not all a dream which made the wife of Julius Cæsar so anxious that he should not go to the Senate Chamber on the fatal Ides of March; and, had he complied with her entreaties, he might have escaped the dagger of Brutus. Disaster followed disaster in the career of Napoleon, from the time that he ceased to feel the balance wheel of Josephine's influence on his impetuous spirit. Our own Washington, when important questions were submitted to him, often has said that he should like to carry the subject to his bed-chamber before he had formed his decision; and those who knew the clear judgment and elevated purposes of Mrs. Washington, thought all the better of him for wishing to make her a confidential counsellor. Indeed, the great majority of men who have acquired for themselves a good and great name, were not only married men, but happily married—"both paired and matched."

LITTLE can be done without determination, and certainly no great acquirement can be made without patience and steady application.

IF you have to depend upon the charity of others, you are undone; therefore, always stand upon your guard.

A PLEASANT wife is a rainbow set in the sky, when her husband's mind is tossed with storms and tempests.

MOORE'S RURAL NEW-YORKER.

ROCHESTER, JUNE 18, 1853.

PUBLISHER'S NOTICES.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW-YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ ADVERTISEMENTS must be brief, appropriate to the objects of the paper, and accompanied with the cash.

## Protective Union Associations.

The finished Product, of whatever character it may be, is enhanced in cost to the Consumer by every hand through which it passes. No maxim in political economy is more self-evident than this, yet by the great body of the people, none practically is less considered in the matter of articles of every-day use and necessity. From the manufacturer to the retailer, each step adds to the price of every commercial product, and any plan which brings maker and user nearer to each other, works visibly for the benefit of the latter, and is without injury to the interests of the former.—This lessening of distance and decrease in cost, is in some degree accomplished, by what is known in New England as the "Workingmen's Protective Union," and several hundred Divisions of that Association.

This plan was started about ten years ago, by some fifteen persons, who clubbed together for the purpose of buying some articles of domestic consumption generally needed, at the wholesale prices, which were to be supplied at first cost to the members. They found that in their first purchase of only $40 worth, they had saved to themselves $10. This was so satisfactory, that the practice was continued, and spread among the working classes, so that within a few months a dozen such Unions were formed in as many villages. The idea was soon suggested of a federation of the Divisions, that the most of their purchases might be made by one general agent, or committee, and, of course, at a less price than by single Associations. The organization of the General Union took place early in 1847, but in a less effective form than at present,—though there are still serious draw-backs on the perfect success of the enterprise. The process by which these Associations, by lessening the cost of the necessaries of life, save money, may be stated as follows:

1. With their capital, made up of a stipulated sum from each member, they buy at wholesale the articles generally desired, and sell them to the members at a price just sufficient to cover expenses. A single Division can do this for itself, but by the General Union.

2. They buy through one agent, overleaping wholesale jobbers, and going back to importers and manufacturers, thus saving the profit charged by both jobbers and retailers, amounting to from 25 to 50 per cent. on the first cost of most articles.

3. They do a cash business—buying for cash alone and selling for ready pay only. Thus there are no bad debts to diminish and eat up the capital. Less capital is also required, and the rapidity with which it is turned over and over again surprises all. From the statistics published by the Central Union, and copied by the N. Y. Tribune, to which we are indebted for much of the information condensed in this article, it appears that the yearly sales amount to from ten to twenty times the capital employed. This shows the value of the system, as well as the vast amount of needless capital employed in the transfer of the product to the consumer.

There are over four hundred Divisions, numbering thousands of members and tens of thousands of purchasers, with as neat and commodious stores as can be found anywhere, now in successful operation in New England. Their aggregate trade is estimated at over four millions of dollars—saving their members at least one million of dollars per annum.

Successful as the Protective Unions have proved, it is thought that they might be made still more so. They are now mere voluntary associations from which any and every member can withdraw his investment when he pleases, thus rendering the amount of capital uncertain and liable to constant fluctuation. The investments of the members should be transferable, but not liable to be drawn out without the general consent of the Union. There are needed also legal checks against fraud on the part of the agents.—There are now none of any worth, as the only process which will hold aganist dishonesty or embezzlement is for breach of trust, the Associations being only a sort of co-partnership, with many members, and the more of them, the greater the difficulty of reaching those who have or would defraud them.

Another defect is the unsettled and constantly changing legislation of the Central Division, composed of delegates from the several divisions. An association like this is best governed when governed the least, and when invoices, and legers, and balance-sheets show that all is going on prosperously, well enough should be let alone nor made the subject of jealousy and clamor. It is true, that the members ought to be able to judge of their own interests, but they can hardly do so without a wider experience in mercantile matters than most of them possess. They are, however, learning these defects and remedying them, and the success of the principle will doubtless cause it to extend over other sections of the Union.—B.

WARM.—Tuesday, the 14th, was the warmest day of the season. At 3 o'clock P. M. the mercury stood at 91° in the shade.

## The Weather, Crops, &c.

Now is the Winter and Spring of the farmer's discontent made glorious Summer by the genuine rays of old Sol, and all the clouds and cold rains that lowered upon and prevaded his premises, have vanished in warm and *growing* sunshine.—During the past week the weather has been warm and pleasant—very favorable to the growing crops, and for farm operations. Vegetation of all kinds has advanced most rapidly.—everything seeming to rush upward and onward to size and maturity.

The grass crop will be, or is, heavy, beyond question, and the pastures are in excellent dress. The weather is very favorable for corn and other spring crops. Though corn is late, the leaves are broad and healthy, and pushing forward with a vigor that will soon atone for late planting. The same may be said of potatoes. The prospect for fruit is generally good, though the peaches are blasted in some localities. The wheat crop promises well for a fine yield—though, should the weather continue dry for two weeks, the crop on clay land will not meet present expectations.

Some ten days ago we had a glance at the country and crops in several counties of the "Wester Reserve," in Ohio; and more recently have passed through the principal farming districts of Western New York between Buffalo and Syracuse. Though we everywhere observed evidences of the cold and backward season, the recent favorable weather, and the general appearance of the country, indicated abundant crops of most kinds.

We annex sundry paragraphs from exchanges, relative to crops, &c., in different sections of this and other States:

THE Boston *Journal* says the grain crops never looked finer in Massachusetts, New Hampshire, Connecticut, and doubtless all over New England, than at the present time.

CROPS in the valley of the Hudson every where present a thriving appearance, and promise abundance. The landscape is now arrayed in its most luxuriant attire.

THE CROPS.—It is said by those who have looked over the ground, that notwithstanding the the cold, wet, backward spring, Wheat, Oats and Grass, never looked better, and that spring crops generally, are now coming on remarkably well.—*Batavia (Gen. Co., N. Y.) Times, June* 14.

WE notice accounts in a number of our exchanges of the appearance of the Hessian fly in various sections of this State. The wheat fields infested with this destructive insect present a yellow and unthrifty appearance, and the yield will be very materially shortened. In Green County they are very numerous, and we regret to hear that in several parts of Jersey they are destroying the wheat.—*Jerseyville (Ill.) Prairie State, June* 2.

THE wheat crop in this neighborhood presents a fine appearance, and promises well. We understand, however, that in many parts of Highland and Adams the fly has done great injury to the wheat: some fields destroyed, and none worth harvesting.—*Ripley (O) Bee., June* 7.

THE CROPS.—The wheat crop in this State, was never more luxuriant, and never did it give promise of a more abundant harvest than at the present time. Gentlemen we have lately met from all parts of the State, lead us to the belief that the wheat crop of Michigan will this year be the largest ever sent to market. The weather thus far has not been very favorable for the crops.—The rains have been cold, followed by a hot sun, leaving the surface of the ground hard and crusty.—*Detroit Press, 8th inst.*

THE prospect is that we shall have abundance of fruit this season, a thing which has not happened before for years. The wheat crop looks finely, and bids fair for an abundant harvest. All the spring crops were necessarily got in late.—*Huntington (Ind.) Observer, June* 7.

WE see by our exchanges that the fly is committing fearful ravages on the wheat in most of the great wheat growing counties of the State.—It is also stated that where guano has been used there is no appearance of the fly.—*Doylestown (Pa.) Dem., June.* 7.

THE Weather continues auspicious for the farmer. Great crops this season, and no mistake.—Lots of fruit, also. Many of our choice roses are now in full bloom. Great country all round, and railroads soon to be added.—*Iowa Tel., June* 4.

## The Canal Enlargement Secured.

ADVICES from Albany state that the Vanderbilt Plan, with some immaterial modifications, has been agreed to by the Committee of Conference, and it is believed both Houses will concur by a large majority. This will secure the Speedy Enlargement of the Erie Canal, and the completion of the lateral Canals.

We subjoin the substance of a despatch from Albany to the Democrat, as follows:

The Conference Committee have agreed upon a bill for the more speedy Enlargement of the Canals.

It is mandatory in terms and effect. It contemplates the enlargement and completion within four years after the amendments have become operative. It contemplates two and a half millions a year for four years. It permits, in addition, a loan of a million and a half, for the repayment of the Canal Revenue Certificates.

It contemplates loans for the entire amount, and pledges the nett earnings of the Canal Revenues, for the re-payment of the money borrowed.

It finally contemplates a re-letting of the entire work to the lowest responsible bidder; and, for greater caution, restricts the application of the money borrowed, to payments for work under the new contracts.

These will be recognized as the leading features and principles of the Senate plan, as perfected and modified by the minority of the Canal Committee of the Assembly—Speedy and self-enlargement, and completion by loans based upon the nett earnings of the Canals, and without adding to the public burthens.

THE STEAMER ADMIRAL, which plied between this port and Toronto, was burnt at her wharf in the latter city last week. A large number of emigrant were on board, and lost all their baggage, as did also the officers and crew of the steamer.

DON'T BE FOOLED.—A Circus is nothing but a Circus, even if advertised under the just now popular cognomen of "Hippodrome"—or as a "Hippodrome, Menageric *and* Circus."

# N. Y. Legislature.

## Extra Session.--Synopsis of Proceedings.

TUESDAY, June 6.—*Senate.*—Neither House transacted any business after the return from the Niagara Falls Excursion.

TUESDAY, June 7.—*Senate.*—A bill was passed authorizing the appointment of thirty-four additional Notaries Public, and several of a local character. Others were introduced and ordered to a third reading, among them one relating to Plank Roads.

*Assembly.*—The Senate's resolution for a Committee of Conference was received, and after a long debate the following members were appointed:—Messrs. Loomis, West, Champlin, Case and Littlejohn. Several local bills passed, and the House adjourned.

WEDNESDAY, June 8.—*Senate.*—Considerable business was done, but none of remarkable importance, except amending the Bank basis law so as to take U. S. stocks in full, instead of one-half.

*Assembly.*—The only bill of general interest we note as passed in the House, was one providing for the instruction of Common School teachers.

THURSDAY, June 9.—*Senate.*—The Atlantic and Pacific Railroad bill was debated nearly all day, and ordered to third reading. Private claims occupied the evening session. A resolution was proposed that members shall not take pay during recess. The bill authorizing U. S. stocks in full as Banking Basis, was received from the Senate, and referred to report complete. It was afterward taken up and debated until adjournment.

FRIDAY, June 10.—*Senate.*—Among the bills passed was one to authorize the State to contribute toward the erection of a monument in the city of Philadelphia, to commemorate the Declaration of Independence. Mr. COOLEY gave notice that he would ask leave to bring in a bill recommending a Convention of the people of this State, for the purpose of amending the Constitution in such a manner as to insure the speedy completion of the Erie Canal Enlargement, and the lateral Canals, and without imposing onerous taxes on the people. The afternoon session failed for want of a quorum.

*Assembly.*—Several reports made, and local bills passed, but nothing done of general interest.

SATURDAY, June 11.—*Senate.*—A debate in Committee of the Whole, was held on passing the bill relative to preventing cattle from running at large on Railroads, &c. Various local bills were passed.

*Assembly.*—Among the bills reported was the Militia bill complete. A variety of local and unimportant bills were passed.

# Correspondence.

## Notes from the Capital.

ALBANY, June 13, 1853.

EDS. RURAL:—The Legislative Excursion, which has been duly chronicled "by all the papers," caused a serious interruption in the progress of business in both Houses. The end—of the Extra Session—is not yet; and it is a problem to determine when it will be.

As predicted in my last, the "West Plan" for completing the Canals, passed the Assembly, and was promptly rejected by the Senate. A Committee of Conference was appointed, and it is expected that they will make a report of some kind to-day. Should they succeed in effecting a Compromise, a favorable result may be hoped for, and the business of the Session come to a speedy close, as, aside from the Canal question, there is very little to detain the people's representatives within the limits of a dirty city.

One of the most important bills now pending, is what is called the "Catholic bill," which gives to the Catholic Bishop the right to hold the property of that denomination in the name of his office, and thus have it descend to his successors. It is undoubtedly a power that ought not to be placed in the hands of any one man, yet as all other denominations have laws that enable them to hold property as they think proper, it may be necessary to grant Catholics the same privilege. The Temperance bill may receive some more attention, although it is not likely to be passed into a law.

Last Friday evening I attended a public exercise at the Normal School building, consisting of an eloquent address before the Literary Societies of that Institution, by the Hon. J. W. BEEKMAN, of the Senate, together with a sprightly poem delivered by J. FRANK WRIGHT, of the School. The Hon. Senator chose for his theme, the subject of HEALTH. He compared the pale-faced and go-aheadative Yankee with the robust Englishman, the cheerful Frenchman, and the fun-loving German, showing that one great cause of feeble constitutions in America, is the absence of proper amusements. Children should be taught as in Prussia, "to ride, shoot, and tell the truth."—Music and mirth, fun and fishing, were recommended. Americans have neither national songs nor national sports. The three great and crying wants of "Young America" were said to be, "*rest, good food,* and *play.*" As disease and insanity are fearfully increasing, he would warn them to shun "long faces, table movers, and spirit rappers," and urged them to study their Bibles as the source of truth, and the guide of their lives.

The Societies tendered a hearty vote of thanks to the speaker for his eloquent and instructive address, whereupon the large and delighted audience dispersed. Such meetings must prove highly beneficial to the pupils of this most excellent Institution, and through them to the various sections of the State which they represent. I think the Senator's address will be published.

"OWE."

## Incidents of Travel Westward.—No. 6.

*Akron, its business facilities—Much Rain—Fine prospects for wheat and grass—The "Garden of the West"—Mr. Blake and his paint—Why he has grown rich—Illustrtion of the principle that small and quick profits are the sure "road to wealth"—Meaning of the word Ohio.*

AKRON, Ohio, June, 1853.

AKRON is a village of 3,300 inhabitants, and the capital or chief town of Summit County. The name is quite apropos, being a Greek word, meaning "hilly." The village is within an ampitheatre of hills, much resembling some of the thrifty villages in the Green Mountain State,—a diversity of hill and dale, high peaks and mountain gorges, rendering it strikingly picturesque and romantic. It is situated on the Cuyahoga river, some 35 miles from its mouth.

A branch from the Cleveland and Pittsburgh Railroad extends to this place, and is to be extended to Zanesville, in the interior of Ohio, and thence to Cincinnati. Two Canals, the Ohio and Pennsylvania, pass through this place. It has five flouring mills, which do an immense business, one bank, two presses, two woolen factories, one sash and door factory, and between twenty and thirty stores.

The streams are much swollen. The month of May has been extremely wet. To use the language of a Buckeye, "it has rained all the time, and Sundays besides." The prospects for a large hay crop are very flattering. The farming country, diversified by rich bottom lands and rolling swells, orchards of apple and peach, hill-sides covered with flocks and herds, presents a charming appearance. All along the high-way the wheat fields give most abundant promise, and are literally the embodiment of the Poet's idea,

"Sweet fields, arrayed in living green."

The "Western Reserve" is termed the "Garden of the West." It is so regarded by men of the soundest judgment—the most intelligent and best informed in our country. For the production of the cereals, for nearly all kinds of fruit, or for grazing purposes, the climate and soil are eminently adapted,—and this part of the State is rapidly increasing in wealth and local prosperity. Akron is one of the numerous and go-ahead villages of the "Reserve." It has been, until recently, the residencee of Mr. BLAKE, (now of New York city,) who obtained, a few years since, a patent for the right of discovery and application of a new paint for buildings. It is called "Blake's Artificial Slate." There are vast quantities of it in the vicinity of Akron. When dug from the earth it is of the consistency of blue clay, but on exposure to the atmosphere soon becomes as hard as a stone It is then broken, ground, barrelled, and sold at about $2,50 per hundred at the mills. It is of different colors, black, chocalate, and drab. This paint is now very fashionable; hence the dingy colored houses that everywhere mar the beauty of our cities, villages and country towns. The drab color is preferable to the darker colors for houses, and when trimmed with white is not objectionable to the eye. As to the economy of its use we have no doubt. Insurance Companies here insure buildings the roofs of which are painted with this paint, at a lower rate than if not so painted. Mr. BLAKE, the proprietor of this 'right,' has now one or more heavy suits pending against those who have infringed upon his patent. A few years since his means were very limited—now he is said to be quite wealthy. The low price at which he affords his paint in the market, insured a large and rapid sale, and he is undoubtedly worth more money to-day, than he would have been had he fixed a price double or treble what he did.

The great truth is fast being established that corporations engaged in carrying passengers, increase their income or profits in proportion to their decreased rates of conveyance. This has been finely illustrated in England. A certain company were not allowed to have their profits exceed a certain per centage on the capital stock. Finding, by calculation, that their profits were likely to be too high for the law, the Company reduced the price of travel to one-half its usual rates, but this failing to remedy the matter, they reduced it again to one-fourth its customary price, and still found an increasing treasury. Finding these steps ineffectual for the accomplishment of their object, they concluded to raise the fare somewhat above all former prices, and attained their end.—Of the truth of the above we cannot vouch, but had it from a gentleman of intelligence, veracity and acknowledged worth. Most certain it is, that cheap postage is a source of national gain in England and America. Shrewed business men will act upon the principle, and enhance their gains.

In a former number we stated that the State derives its name from the noble river—Ohio—which sweeps its eastern and southern boundary for 470 miles. The term is Indian, and means "beautiful." S. B. ROCKWELL.

THE RIOTS, AND LOSS OF LIFE, in Quebec and Montreal—occasioned by the lectures of Father GAVAZZI against Catholicism—are the theme of much remark in both Canadian and American papers. The accounts are so conflicting, and incomplete, that we are unable to present the facts in detail. A despatch form Montreal, dated Saturday, 11th, states that, "so far as can be learned, after careful inquiry, the number of persons shot is about fifty, and of those killed outright or mortally wounded, from ten to twelve." GAVAZZI left the same day for New York, but was to return, in a few days, (as requested by a large meeting of citizens,) to finish his course of lectures. The city was in a state of intense excitement at the latest dates.

☞ The Portland Argus says the Eastern District in Lincoln county, Maine, has chosen a *lady* for Register of Deeds, in the person of Miss Olive Rose, formerly an assistant in the office. Miss Rose has two-thirds of the votes. The Argus remarks, "Whether a female is eligible to such an office under our laws, is the question to be settled."

# News Brebities.

—— The Adelphi Theatre at Edenburg has been destroyed by fire.

—— The U. S. Behrings Straits expedition sailed from Norfolk on the 7th inst.

—— Advices from Bermuda represent that the season is an unusually favorable one.

—— There are six thousand Frenchmen and five thousand Germans in San Francisco.

—— The Mormon elders in Persia are to be expelled from that country, according to the latest advices.

—— The Peter Funks in New York have taken to selling books, and the papers warn people against them.

—— The New York city amended charter passed by a majority of 33,121, at the recent election on the 7th.

—— During the present year 2,224 Coolies from China have arrived in Cuba; 333 died on the passage and 70 after their arrival.

—— The New York State Temperance Socicicty meets in St. John's Church, in this city, on Thursday of the present week.

—— It is reported from Havana, that the entire British fleet, the Buzzard and Medea among them, are out in pursuit of Slavers.

—— At a recent election in Washington City, there was a large majority in favor of "No License," on which a vote was taken.

—— The Westfield (Mass.) liquor agency has sold $1,700 worth of liquor during the last year—all for medicine! Sickly town, that!

—— Four thousand passports have lately been issued to Hungarians who design coming to America. Most of them go to California.

—— At the great Southern Convention, which met at Memphis on the 7th inst., one thousand delegates were present from fifteen States.

—— Allen W. Bowen, Agent of the Western Railroad at Shaker Village, Mass., was crushed to death while detaching a portion of the train.

—— One thousand acres of coal lands, situated in the George's Creek region, Md., were recently purchased by New Yorkers for the sum of $180,-000.

—— Enoch Reid, the colored man who was convicted of participation in the "Jerry Rescue" at Syracuse, died of consumption on Wednesday week.

—— The Buffalo papers notice a hog in that city, which weighs 1,109 lbs. He intends to exhibit himself at the World's Fair, as they call it in New York.

—— Rev. Horace Bushnell has just signalized the twentieth anniversary of his installation as Pastor of the Third Congregational Church in Hartford, Ct.

—— A mass meeting of the colored citizens of Chicago has been held to appoint delegates to the Colored National Convention, to convene in this city, on the 6th day of July.

—— The "Black Swan" (Miss Eliza Greenfield) has been giving concerts in England. One was at Stafford House, before the Duchess of Sutherland and a party of friends.

—— Two men were sentenced to one month's imprisonment at hard labor, a short time since, in London, for the crime of causing unnecessary pain to a cat while they were killing it.

—— The Elmira Gazette says, the Misses Mathews, daughters of our late worthy Postmaster, have acted efficiently in the capacity of Post Office Clerks for the last four years.

—— The Auburn Daily Advertiser says that Derby & Miller sold 10,000 copies of Fanny Fern's Book, the first week, and that the sale thus far beats that of "Uncle Tom's Cabin."

—— Forty-two skylarks have been brought from England, and let loose near Wilmington, Del., in the hope that they will soar and sing and multiply on this side of the Atlantic.

—— A farmer drove across from Lewiston to Canada with a load of potatoes, neglecting to pay the duties. The sharp-set officials pounced upon wagon and horses and confiscated them.

—— Forty-two skylarks have been brought from England, and let loose near Wilmington, Delaware, in the hope that they will soar and sing, and multiply on this side of the Atlantic.

—— The next Annual Convention of the Episcopal Church in the Diocese of Western New York, will be held in St. Paul's Church in Buffalo, on Wednesday, the 17th of August next.

—— The N. S. Presbyterian General Assembly recently in session at Buffalo, disposed of the niece-marrying question by declaring it contrary to the laws of God and revolting to humanity.

—— The Cleveland Plain Dealer smells gunpowder, and thus calls out:—"Boys, get up the military spirit, for another Mexican War is looming in the horizon. Hurrah for the Mescilla Valley!"

—— That part of the Northern Railroad, from Toronto, already in use, does a good freighting business, principally in flour and lumber, which is deposited upon the wharves at Toronto for shipment.

—— Rev. Miss Brown announced at the Christian Union Convention, in session at Syracuse last week, that she had just assumed the pastorship of a Congregational church at South Butler, Wayne Co.

—— An Anti-Beef-Eating Association has been formed in Philadelphia. The members pledge themselves against eating any meat which costs more than eight cents a pound. The present price is eighteen cents.

—— A white man was sold for vagrancy, for the sum of twenty-five cents, the other day, in Ogle County, Ill. His purchaser not being able to make change, the "chattel" loaned the necessary sum. The man had a family.

—— The Louisville Journal says a contract has been made for 1,000 hogs, to be delivered 40 miles from the city, between the 10th of November and the 20th of December next, and to weigh not less than 200 lbs. per weight, at $3,50 per hundred.

—— The Postmaster General, availing himself of the authority contained in a provision of the postage act of March 3d, 1821, has ordered a reduction in the rate of postage on pamphlets and magazines sent to, or received from foreign countries.

—— The State authorities of Pennsylvania, have remitted the interest on a collateral inheritance tax in a legacy of $20,000 left by a Roman Catholic lady of Pittsburg, to a benevolent institution. The interest, at 12 per cent., amounted to $625.

—— Doct. F. B. Hough is preparing a History of Jefferson County. These local histories, though too little appreciated now, will become immensely valuable. Competent men should in like manner garner up the historical memorials of every County in the State.

# Foreign Intelligence.

## Arrival of the Pacific.

The Pacific arrived at New York on Sunday P. M. (12th,) from Liverpool, which port she left on the 1st inst., with 128 passengers.

The Asia arrived out on Saturday the 28th, at 9,45 P. M.

Liverpool, May 31.—The Asia's accounts do not affect the cotton market, being counterbalanced by an unfavorable aspect of foreign affairs. Market remains with good inquiry, but without animation.

Breadstuffs have an advancing tendency.—Wheat 1d advance since Friday. Flour sells free at 3d and slowly at 6d advance. Corn active and unchanged. The weather delightful, but the rise is owing to the fears of a Turkish war.

Beef and pork very dull. Cheese brisk. Lard steady. The large imports of bacon check transactions, and a declining price is looked for.

Money in demand. Consols depressed by the Turkish news, and closed at 100a100¼. Foreign securities drooping, particularly Russian. Bank stock firm.

The English Government refused in both Houses to state whether or not the Mediterranean fleet had been ordered to assist Turkey.

Interesting discussion had taken place in the House of Lords, respecting the conduct of the Captain General of Cuba.

Spain has been remonstrated with and promised amendment, but the British fleet off Cuba will be augmented.

The steamer La Plata had arrived from Vera Cruz, with Arista on board.

Large arrivals of gold from Australia.

It was rumored as very likely that Mr. Crampton will be removed from Washington to a better mission.

Nothing about the Stowe movements, except the Black Swan's Concerts.

Nothing from France.

The Bank had agreed to make advances of three per cent on bonded grain.

The Russian army, 100,000 strong, concentrating on Turkish frontier.

U. S. Corvette and Frigate sailed from Alexandria for Europe.

Cape of Good Hope was all quiet.

The prospects of the British in Burmah look black. They had met with a repulse, and the troops had been cut off in skirmishes. A steamer has been sent to India for more troops.

The news from China is important.

Shanghai, April 25.—Nankin was infested by rebels on the 16th.

The Imperial commissioner had hired a Portuguese corchas to relieve the city by water, but was captured by the rebels. He sought aid from foreign councils. French, English and American agreed to help, and the British sent three steamers.

The American Commission Marshall undertook to place the Susquehanna before Nankin. No accounts of the result have yet been received.

There were several stories of imperial victories in the interior, but they are disbelieved.

Com. Perry, in the Mississippi arrived at Hong Kong April 7, and despatched the Plymouth to Shanghai on the 9th.

A private letter from Manchester reports, March 29th, one day later from Shanghai, that Nankin has fallen, and that the British commander refuses to permit the British merchantmen to go up the river with stores or ammunition for either party. It was expected that the Americans would back out.

---

The Maine Law in Michigan.—The Detroit Advertiser thus speaks of the approaching election in Michigan, and the vote to be taken on the new Liquor Law next Monday:

Some misapprehension exists apparently with regard to the subject of the Liquor Law in this State. It is to be submitted to the people on the 20th day of the present month; then if the people vote "Yes," the law takes effect on the first of December next, but if they vote "No," it is to take effect on the first of January, 1870. It requires no further legislation to complete it or render it operative. The very object of placing the law before the people at a Special election, divested of all other issues, was that it might have a fair field, without becoming implicated at the election of State Officers, and become lost in other issues.

---

Horrid Murder.—A horrid murder was committed at La Grange, Dutchess county, on Tuesday. A man named George Lake, killed his two children, aged two and four years, and fatally wounded his wife with an axe. He armed himself to resist capture and was shot, not fatally, before he was arrested. He had been kind to his family, and no cause is assigned for his acts.

# News Paragraphs.

☞ The Sacketts Harbor and Ellisburgh Railroad is now in successful operation. Two trains each way daily, connecting with the Lake steamers and the cars of the Watertown and Rome Railroad. We wish that road abundant success—it deserves success. The enterprise that built it has never been excelled in this country. Great credit is due the people of Sacketts Harbor for the resolute determination they have manifested. It has conquered.—*Watertown Union.*

☞ Two hundred pupils have been instructed, during the present year, in the American Asylum for the Deaf and Dumb, at Hartford. Of these, there were 38 from Maine, 15 from New Hampshire, 23 from Vermont, 83 from Massachusetts, 6 from Rhode Island and 30 from Connecticut.—There are 182 State beneficiaries, 15 paying scholars, and three supported by the Asylum.

☞ Copper ore is arriving in considerable quantities from the Lake Superior region. Over 200 tons of mass copper reached Detroit on the 22d inst. The average value of the ore is $700 per ton, and the whole is estimated to yield $150,000. The principal part of this ore was shipped to Pittsburgh for smelting. About 2,000 tons of copper ore, it is estimated, are now ready for shipment at the various mines.

☞ The Buffalo Express mentions a lot of cattle, sixty in number, recently driven into that town by John W. Taylor, Esq., of Lima, N. Y.—Their average weight is over 1000 lbs. each, and they are valued at $100 per head. There is also another drove of 121 head, nearly as fine as the above, belonging to Mr. Louis Ashbrook. The cattle are intended for the New York market.

☞ A little girl about 12 years old, in Markland, Ohio, obtained 500 names to a temperance pledge, "on her own hook." This started the "old folks," and, in a short time thereafter, nearly everybody in town petitioned the Legislature for the Maine Liquor Law. The young Buckeyes believe that the girl will make something of a woman.

# Market Intelligence.

Rural New-Yorker Office,
Rochester, June 15, 1853.

The very fine weather has given animation to our friends from the the country; they bring smiling faces with their commodities to market, and return laden with the seasonable and fashionable goods of the city, giving much briskness to the trade. A large crowd of boats consequent upon the break at Adams's Basin, have been passing eastward, and navigation may now be said to be in good order.

Flour—Recent advices from the East give the market some firmness. Mills here have been short of wheat in consequence of the break, but are now in full operation. The quotations are not changed.

Grain—Wheat has been coming in more freely, and has submitted to a very slight decline, $1.17 being the highest figures made public. Oats are in demand at 42@43c, a decline. Corn firm at 63c. In other grains no change.

Provisions—The market presents no animation. Butter is dull at 12@12½c. Eggs slow at 10c, and other eatables drooping, except Strawberries and cream, which are particularly seasonable and palatable.

Wool—The clip is beginning to come forward with freedom, for which fair prices are obtained. We learn that at Batavia, 40@51c. are paid, while here we hear 40, 50, 55, and even 60c, named as the market value. We do not advise farmers to hold on for very extravagant prices, as a few weeks will determine its market value, but would only remind them of the adage that "haste makes waste." Good wool will suffer no decline.

In other articles we have no transactions to chronicle.

### Rochester Wholesale Prices.

## NEW YORK MARKET.

NEW YORK, June 13.

FLOUR—A fair demand for Western and State. Demand for shipping restricted, in part by the late advance in freights, and there is more doing for the home trade.—Canadian quiet, $4,44@4,50, with less offering. Sales of Western Canal 5,500 bbls, $4,25@4,44 for inferior Western; $4,5-@4,68 for mixed to fancy Michigan, and common to good Ohio; $4,50@4,62 for common to straight State—closing quiet.

GRAIN—A fair demand for wheat for export, and holders are firm. The supply of prime is limited, and there is little doing for milling. Sales 6,500 bu ordinary to white Ohio, 115@120c, 1,100 bu choice Western, called Genesee, 22c. Barley inactive, 6-@67c. Oats, 44@46½c for State and Western. Corn heavy and not active Sales 20,000 bu, 56@59c for unsound; 60@60½c for Southern yellow, 63@64c for Western mixed.

PROVISIONS—Pork market steady but not active.—Sales at $15,81@15,87 for mess; $13@13,25 for prime.

BUTTER plenty and dull, 13@17c for Ohio; 17@20c for new State.

CHEESE saleable and not plenty, 8@9c.

STOCKS firm, but heavy and inactive. Money unchanged.

## ALBANY MARKET.

Albany, June 13.—Flour, &c.—Sales of the morning aggregate 1,500 bbls, at $4,37@4,62 for common to good State and ordinary Western; $4,50@4.75 for fair to good Michigan, Ohio, Indiana and Wisconsin; $4,87@5,25 for good to extra Western and fancy State; $5,37@5,87 for extra Genesee. Corn meal is steady but quiet at $4.25.

Grain—There is less inquiry for wheat with more offering, and the market is dull. Sales 1,500 bu. damaged Canadian at 72c, and 2,400 bu. good white Ohio $1,19½—Corn is dull and the market is unsettled and drooping.—Sales 1,800 bu. Western mixed at 60½c for unsound, and 62½@63c for sound. The latter an extreme figure. Oats are dull at 45@46c for State. Nothing doing in Rye or Barley.

Feed—Sales 4,000 bu. 23 lb. Feed at 18c.

Hops—We notice a sale of nine bales second quality at 16c. Prime first sort are held at 18@20c.

## BUFFALO MARKET.

Buffalo, June 13.—There is but little inquiry on the market this morning for flour or grain, and the sales are confined to small lots of Michigan and Ohio flour for the town trade at $4,25@4,37½ for choice and fancy brands.

In Wheat the only sale we note is 5,000 bu. white Ohio and Michigan at $1.03. No sales of corn.

Canal freights dull, and boats offered at 52c on flour to N. York, without takers. Corn shipped to Albany at 9½c.

## NEW YORK CATTLE MARKET.

NEW YORK, June 8—At Washington Drove Yard—The supplies have come in rather more freely the present week than for some weeks previous;—prices, however, are well maintained the extremes of the market may be quoted still as from 9@10½c. per lb. as in quality; about 300 head left over, the market closing rather dull.

At Browning's—In market 2,300 sheep and Lambs,—all sold at prices ranging from $3,50@5,50 to $8 for Sheep, and $2,75@4 to $6 for Lambs.

Cows and Calves—150 offered, and all sold at from $30@37,50 to $50.

At Chamberlain's—Offered, 275 Beef Cattle—Prices ranging from 9 to 10c.

Cows and Calves—70 on sale, and sales at prices ranging from $25, $40 to $50.

Sheep and Lambs—2,300 on sale; all sold at from $3 to $4,50@5,50 to $6.50 for Sheep, and $2,50 to $3,50@5,00 for Lambs; market firm and demand brisk.

## ALBANY CATTLE MARKET.

ALBANY, June 13.—W. W. Woolford's, Bulls' Head, Washington street.

Beef Cattle—At market, 717. Prices—Extra, $8,00; 1st quality, $7,50; 2d do, $7; 3d do, $6,50.

Cows and Calves—20 in market. Prices from $30, 35, 49, 50 to 60.

Sheep and Lambs—1,240 in market. Prices $2,50, 3, 3,-50 to 4.

## CAMBRIDGE CATTLE MARKET.

CAMBRIDGE, June 8.—At market, 622 Cattle, about 500 Beeves, and 122 Stores, consisting of Working Oxen, Cows and Calves, yearlings, 2 and 3 years old.

Prices—Market Beef—Extra, sold at $8@8 50 cwt.: 1st quality, $7,50@7,75; 2d do, $7@7,25; 3d do, $6,75; ordinary $6,25@6,50.

Hides—$4.75@5 per cwt.
Tallow—$7@7.50 per cwt.
Pelts—$1@1,50.
Calf Skins 10½@11c per lb.
Barreling Cattle—None.
Veal Calves—$2, 4, 8; 625 at market.
Stores—Working Oxen—$96, 98, 104, 111, 125@157.
Cows and Calves—$28, 31, 35, 42, 51@75.
Yearlings—$12, 12,50@13
Two years old—$32, 35, 38, 41@43.
Three years old—$42, 45, 48, 50@63.
Sheep and Lambs—1,082 at market.
Extra, $5, 5,25@7.50.
By lot—$2,75, 3,25, 3,50@4,50.
Swine—None at market.

Remarks—The market is well supplied and very largely attended to-day. It opened slow but firm, and closed very animated. Mr. Handy, from Ogdensburg, N. Y., brought 151 head of Beeves, 100 of which were remarkable fine animals. Mr. Philbrick, of Rye, N. H., also had 89 superior good looking beeves. A few large fat premium oxen, for which $9 per hundred was asked, but only $8,75 offered, were not sold when the market closed.

## BRIGHTON CATTLE MARKET.

BRIGHTON, June 9.—At market 660 Beef Cattle, 30 pairs Working Oxen, 60 Cows and Calves, 1,000 Sheep and 1,900 Swine.

Prices—Beef Cattle—A small advance was realized and we advance our quotations, viz,—Extra, $8,25@8,75; 1st quality $7,50@8; 2d do, $6,75@7; 3d do $6@6,50.

Working Oxen—Sales $75, 88, 92, 110, 125@140.
Cows and Calves—Sales $25, 29, 37, 40@55.
Sheep—Sales $4,50@5.50, 6,75, 7@8,50.
Swine—Ohio shoats to peddle 6½@7c for sows, 7½@8 for barrows; spring pigs 12@13c., lot retail 7½@8¾, pigs 14c.

Remarks—A lot of 34 fine Durham Cattle raised by Alphens Morse, Esq., of Eaton, N. Y., sold for $9 per hundred to Mr. S. S. Learned, 50 and 52 Faneuil Hall Market.

THE WOOL GROWER AND STOCK REGISTER:
A MONTHLY JOURNAL
Devoted to the Wool and Stock Growing Interests.

THIS is the *only* Journal published in America, primarily devoted to the important and profitable interests of Wool and Stock Growing, etc. It contains a large amount of useful and reliable information on Wool, Stock and kindred subjects, and should be in the hands of

Every Owner of Domestic Animals!

Whether located East or West, North or South, for much of the matter given in its pages is equally interesting in all sections of the United States, Canada, &c., and not furnished in any other publication.

The Fifth Volume, commencing July, 1853, will be enlarged by the addition of eight pages to each number, (as a cover, for notices, &c.,—making in all, 24 Large Octavo Pages,) and otherwise improved. Published in the best style, and illustrated with numerous superior engravings: embracing Portraits from life, of Sheep, Cattle, Horses, &c.,—Designs of Farm Buildings, etc. The Reviews of the Wool and Cattle Markets, given in each number alone worth many times the price of the paper, which is

ONLY 50 CENTS A YEAR!

Five Copies for $2; Eight for $3; Fourteen for $5; Twenty for $7,—*in advance.* Back vols, bound in paper, at 10 cts. each—in sheets at 35 cents. Premiums offered to those who form clubs. Specimen numbers, &c., sent free. See Premium List below.

☞ Now is the time to Subscribe,—as all subscriptions should commence with the volume. Bills of all specie paying banks, and postage stamps, received at par. Money, properly enclosed, at our risk,—if addressed to

D. D. T. MOORE, Rochester, N. Y.

To Subscribers, Agents, and Others.

During the past four months the undersigned has given in cash and other premiums, *over* ONE THOUSAND DOLLARS to persons who have generously exerted themselves in extending the circulation of the Rural New-Yorker,—and now invites the attention of Post-Masters, Agents, Subscribers, and others disposed to aid the Wool Grower and Stock Register to the following list of

LIBERAL PREMIUMS!

1st. TWENTY DOLLARS, IN CASH, to the person who shall send us the greatest number of subscribers to The Wool Grower and Stock Register previous to the 1st of November next, remitting payment according to our club terms, as given below.

2d. FIFTEEN DOLLARS, in Agricultural Books, (or extra copies or back volumes of our journals, if preferred,) to the person who shall send us the second greatest number, as above specified.

3d. TEN DOLLARS, in Books or Papers, as above, to the person sending the next (third) greatest number.

4th. EIGHT DOLLARS, in Books or Papers, to the person sending the next (fourth) greatest number, as above.

5th. FIVE DOLLARS, in Books or Papers, to the person sending the next (fifth) greatest number, as above.

6th. THREE DOLLARS, in Books or Papers, to *each* of the Five persons sending the next (6th, 7th, 8th, 9th, and 10th) greatest numbers as above.

7th. TWO DOLLARS to *each* of the Ten persons sending the next (11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, and 20th,) greatest numbers, as above.

☞ That Post-Masters, Local Agents and Subscribers, wherever the W. G. & S. R. circulates, may have a fair and equal chance to obtain the Premiums, *traveling agents, post-riders, &c.*, are not included in the offer.

SPECIFIC PREMIUMS.

In order to reward *every one* who may send, as agent or for himself, one dollar or more on subscription to the W. G. & S. R., we offer to those who do not compete for the preceding prizes, the following liberal gratuities:

1st. To every person sending $1 for two copies of the W. G. & S. R., we will forward by mail a volume of the Genesee Farmer, (bound in colored paper) for either 1848 or '49 as preferred.

2d. to every one sending $2 for five copies,—or $3 for eight,—we will send either one of the three first volumes of the Wool Grower, well bound in handsome colored paper, or one of the vols. of the Farmer above named, as preferred.

3d. To every person remitting $5 for 14 copies—or $7 for 20 copies—we will send an extra copy of the fifth and either one of the preceding volumes—*or* two copies of any previous volume—*or* three vols. Farmer above named—*or* the Rural New-Yorker for six months. And we will pay like premiums, in the same proportion, for any additional number of subscribers.

☞ Back volumes of the W. G. & S. R., bound in colored paper, will be furnished to competitors at the same rate as copies of the fifth volume—and copies counted in making out their premiums.

Competitors for Specific Premiums will please specify what they want in letters containing remittances—when the volumes will be immediately forwarded.

☞ All competitors for Regular or Specific Premiums must comply with the following

Terms, in Advance:

Single Copy, 50 Cents a Year; Five copies for $2; Eight for $3; Fourteen for $5; Twenty for $7, and any additional number at the same rate—35 cents per copy. Back volumes, bound in paper, at same prices.

☞ Bills of all specie-paying banks, and postage stamps, received at par. Subscription money, properly enclosed, may be mailed at our risk, if addressed to

D. D. T. MOORE, Rochester, N. Y.

M'CORMICK'S PATENT REAPING AND MOWING MACHINE!

WITH the advantage of large experience, for many years, in the exclusive business of making and selling these machines, I have during the last harvest, and since that time devoted much time and expense in experimenting to perfect my machine as a reaper and mower, and am now prepared to warrant this machine superior to every other as a reaper and as a mower. The attention of Farmers is called to the following Improvements for 1853:

1st. Iron Beam for combined machine, which allows the grass to pass over more freely, together with improvements in the fingers.

2d. A *self-adjusting* arrangement for mowing, by which the beam rises and falls, and thus accommodates itself to the inequalities of the ground, which is very important for mowing, though entirely unnecessary for reaping.

3d. Very fine cut sickles for grass. These improvements insuring the perfect performance of the mower.

4th Shortening the platform and placing the raker closer to his work in reaping.

5th. A new and beautiful arrangement by which the machine may be raised from the ground to any desired height in five minutes time, with the main wheel enlarged.

From the well known reputation of my machine, in the hands of more than 7,000 farmers, in this country, and that it has maintained its high superiority, wherever it has been fairly tested. Having again, after a series of trials at the last harvest in England, and after a contest with Hussey's, in a trial of nine days, upon the Royal Agricultural farm, which was the most extended contest ever made with Reapers in any country, been declared by the able jury of English farmers (see their report in my handbill,) decidedly the best machine, capable of cutting when the grain was green or ripe, wet or dry, in all weather when Hussey's could not be worked.

The verdict was that McCormick's machine is entitled to general patronage, that it was considered next to perfect in principle, such as good cutting at any pace of the horses; proper delivery at the side, and economy of both house and man labor—an implement that might be depended upon for a harvest by any farmer. Further testimonials of its superiority can hardly be necessary.

To convince such responsible farmers as are in doubt, which is the best machine, and of my entire confidence in the superiority of my own, I will permit them to take one of mine, with one of Hussey's or Burrall's on trial, to keep the one preferred.

That Manny, Seymour & Morgan, and others, who are making and selling my machine, *in a changed and injured form*, with the hope of being able to avoid the responsibility of infringing my patent, is the best evidence of the superiority of my machines. They will all be held responsible, and their infringements arrested as soon as the law, which is sure, can have its course. Those purchasing and using their machines, become jointly liable with them.

The purchaser of the Reaper and Mower will save $85 of the expense of a Reaper and Mower if purchased separately. The machines will be forwarded to any part of this State or Canada, if ordered in season of Thomas J. Paterson, General Agent, Rochester, N. Y.,—office No. 6 Burns' Building—subject to freight from Buffalo. Price $110 cash; or $115, $30 payable on delivery, and the balance on time, and $25 cash addition, or $30 on time, for mowing attachment. A Reaping machine alone, an excellent article, can be had for $100 cash or $105 on credit, for which mowing attachments will be furnished next year.

C. H. McCORMICK.
June 15, 1853. 181tf.

FIRST PREMIUM REAPER.

AT the great Trial of Reapers in the Harvest Field at Geneva, N. Y., in July last; the Burrall Reaper, in competition with eleven others, was awarded the

FIRST PRIZE OF FIFTY DOLLARS!

and also a Diploma, by a Committee of twelve, appointed by the New York State Agricultural Society. The Committee, in their Report, remark, that "T. D. Burrall's machine performed its work in the *most admirable* manner; the gavels were well laid; the *workmanship* and *materials* were *excellent;* the *circular* apron for side delivery, the *balance wheel*, and an arrangement to elevate the exterior edge of the apron, are valuable features," &c., &c.

During the last two years a large number of these Reapers have been in use, giving entire satisfaction in all cases. This cannot be said, in truth, of any other Reaper. We have received letters from more than fifty practical Farmers of Western New York, who have purchased and used this machine, and all speak of it in the highest terms of approval—pronouncing it *superior to any other* that has come under their observation. We have published the larger part of these letters in a hand-bill which we would be pleased to furnish any who may apply either by letter or otherwise.

☞ This Reaper has no hand-wheels, pullies, straps, or harness of any kind to get out of order, as is the case with other Reapers; but, on the contrary, it is simple and compact, being made of few parts, well arranged, and each part having its proper relative strength—consequently, it is durable. Its draft is light, and the grain is delivered from it with ease, and in nice order for binding. In all these respects it is superior to any other Reaper. It so struck the Committee at the great trial at Geneva, and occasioned them to remark in their Report, that "it performed its work in the *most admirable manner*, and that the *gavels were well laid*," &c., &c.

The cutting of wheat, barley, oats, rye, buckwheat and seed clover, is so important to the farmers of grain growing districts that they should see to it, that they do not get forced upon them a second or third rate machine for these purposes. No small consideration, at least, should induce them to have any thing other than the best. But how shall it be determined which is best, when manufacturers and agents each, assert the machine in which he happens to be particularly interested, to be the best? Under this state of things the question should be determined in favor of that machine, the manufacturer or agent of which can produce the largest amount of reliable evidence of its superiority. Interested persons are not always to be trusted, but generally disinterested persons are. Well, then, who can produce the best and most evidence from the class which is reliable? We claim that we can; and we will begin by reasserting that a Committee of twelve disinterested persons, after seeing all the Reapers of any note at work side by side, which was the greatest test ever had, pronounced the Burrall machine the best. *They* did not call any other best.

We also say that of all the Burrall Reapers sent out not one has been returned. All have given the most entire satisfaction, and in most cases have far exceeded the expectations of purchasers. These assertions cannot be made, in truth, in reference to any other Reaper. We are therefore, willing to leave the question, which is best, to be settled by the *disinterested;* and we would say, inquire of those of that class who have knowledge on the subject, and also examine the different machines for yourselves, and if you do not become convinced that ours is the most simple and durable—that it will cut when driven either slow or fast—that it will cut green or grassy wheat—that its draft is comparatively light—that the grain can be got off from it with ease and in nice order for binding—then don't purchase this Reaper; but if you find it equal in all these good qualities, and far superior in many, to any other Reaper, then those who have not already done so, will please hand in their orders as early as possible, either to our agents or ourselves. This will enable us more fully to supply the demand.

The undersigned have the *exclusive* sale of the Burrall Reaper in the State of New York, west of a line passing north and south through Canandaigua.—and those therefore, who desire to purchase will please hand their orders to either ourselves, or our authorized agents, who will make sales on equally as favorable terms. We also have the right of selling machines for use in any of the States and the Canadas.

[181-3t] BRIGGS & BROTHER,
June, 1853. 68 State st., Rochester, N. Y.

PALMER AND WILLIAMS' SELF-RAKING REAPER.

THIS Machine was patented July 1st, 1851, and has been thoroughly tested the two past years. It is very simple in construction, having only one entire cog wheel and one pinion in the whole machine. The driving wheel is about four feet, and the ground wheel thirty inches in diameter; are so arranged as entirely to obviate the side draft, and hence a single team can manage it with speed and ease. The knife or sickle is scolloped, and cannot be clogged in any kind of grain. The grain is raked off so as to be out of the way of the team in repassing, and is in good shape for binding. The size of the sheaf is perfectly under the control of the driver. By a simple movement of his foot, he can throw the rake in and out of gear. If, however, he pays no attention to it, then the raking off will be done at regular intervals. In backing, the entire machine is thrown out of gear, and ceases to operate. *We* are the exclusive manufacturers of this Reaper for the harvest of 1853, and have been extensively engaged for several years in the manufacture of agricultural implements, and have examined the working of several Reapers, and received proposals for building others, but consider this far superior to them all. Such is our confidence in its superiority that we now have *one hundred* of them in course of manufacture, and shall be ready to deliver them on orders by the 1st day of June. We warrant the Reaper *well made* of good materials durable with proper care, and capable of cutting better than by ordinary cradling, from 15 to 20 acres of standing grain per day, laying it in gavels for binding.

Appended are a few certificate of its operations:

Janesville, Wisconsin, Jan. 12, 1853.

Messrs. Palmer & Williams, Gents.:—After receiving your Reaper I laid mine aside, and finished my harvest with yours, (10 acres.) It is a perfect self-raker, it cuts the grain perfectly in all conditions, and rakes it off out of the way of the team in repassing. It runs lighter than any reaper I have ever used, two horses managing it with ease. Farmers can now rely upon a Self-Raking Reaper, that will work to their satisfaction. H. P. CULVER.

Batavia, October 6, 1852.

Mr. Palmer, Sir:—I have cut 70 acres of wheat with the Reaper I purchased of you. Much of it was heavy and lodged. It cut it in the neatest manner and raked it off better than it could have been done by hand, leaving the grain ready to bind. I only used one span of horses and cut nine acres and a half in 3 hours and 55 minutes. I cut nineteen and a half acres per day. I believe I can cut with one good team, 25 acres per day. I have used other kinds of Reapers, but consider yours vastly superior to all others; in a word, it is easy for a team, does the work well, and is a very great saving of labor and grain.

Yours, &c, C. R. BRINKERHOOP.

Batavia, N. Y., October 25, 1852.

Messrs. Williams & Palmer, *Gents.*:—We, the undersigned, saw the Reaper (known as "Williams & Palmer's Self Raking Reaper,") in full work in C. R. Brinkerhoof's wheat field, in the last harvest, in this town, and we are glad of the opportunity to express our entire approbation of the work done, both in cutting the grain and raking it off the machine. We were surprised with its simplicity, and could not but admire the ease with which the raking part is controlled.

H. U. SOPER, H. H. CORBIN,
JOSEPH GATES, M. U. SOPER,
JOHN DORMAN, E. HOWELL,
H. BOSTWICK. Rev. A. STEELE,
CHESTER SCOTT, R. FERREN.

Sweden, January 1, 1853.

Messrs. J. Ganson & Co.:—I have examined the Self-Raking Reaping Machine now being built by you. I have had a good deal of experience in harvesting grain with a Reaper, usually cutting my own grain, from 100 to 150 acres per year, and am free to say that I consider Palmer & William's Self-Raking Machine the best Reaper I have ever seen. F. P. ROOT.

Brockport, January 1, 1853.

Messrs. J. Ganson & Co., *Sirs:*—I cut with the Self-Raking Machine I had of Palmer & Williams, in the last harvest, about 80 acres of wheat; some of it was badly lodged. I have tried several reapers, but consider yours vastly superior to any I have ever used. The raking off was well done. It drops the grain in good shape for binding, without leaving a trail. The cutting is done without clogging and the draft I think full one-third easier for a team than the ordinary reaper. ISAAC PALMER.

Springfield, Ohio, July 2, 1852.

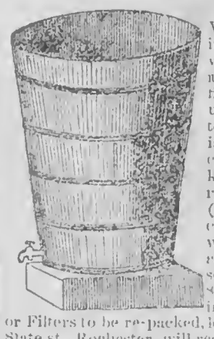
Mr. Palmer:—This certifies that we were the binders of the grain on the final trial of Reapers, by the Ohio State Agricultural Society, and that it is our opinion that Palmer & Williams' Self Raking Reaper left the grain in the best manner for binding of any Reaper on the ground, and that it done all its work equal to any of them.

SAMUEL PATTEN, JOHN MANGAN,
WM. A. REID, JOHN FARREL,
TIMOTHY MANGAN, MICHAEL HARD,
WM. FOSTER, *Owner of the Land.*

J. RAPALJE & CO., of Rochester, Agents for the sale of the above Reaper, will supply all orders at manufacturers' prices, transportation added. Machines are on exhibition at their Warehouse, No. 65 Buffalo street. 179

MONEY TO LOAN on Bond and Mortgage, on improved farms. L. A. WARD,
[169m6.] 36 State St., Rochester, N. Y.

RAIN-WATER FILTERS.



THE use of Filtered Rain-Water, for drinking and cooking purposes, has more to do with health, than most persons are aware. Hundreds of the first families in this city have used the Filter from one to fourteen years, with the highest satisfaction, and the demand increases, as their worth becomes known. As an article of luxury, aside from health, no family (living in lime stone sections of country,) ought to dispense with their immediate use. They can be safely forwarded to any section of country. Price, 5, 6, 8, and 10 dollars, each, according to size. Orders for Filters or Filters to be re-packed, left at J. Packard's watch shop, State st., Rochester, will receive immediate attention.

JOHN KEDZIE.

Rochester, N. Y., June, 1853.

For Sale, or to Lease for a term of years.

A VALUABLE FARM, and genteel residence at Wellsboro', Tioga county, Pa. The homestead of late Hon. Samuel W. Morris, containing four hundred acres, will be sold entire, or may be divided into four eligible farms. Dwelling large and convenient, (16 rooms, besides halls, pantries, and garrets,) grounds well laid out, and in order; wood and ice houses; milk and wash room—running water in each of the latter.—Comfortable new tenant's house. Barn and stabling complete. Two good orchards. A fine sheep or dairy farm; will keep one hundred cows. A plank road connects with Corning and Blossburg Railroad, and the surrounding lumber region, gives also a home market for produce.

Town lots enough remain unsold to nearly pay for the property. Title unincumbered. Possession given in September, 1853. Price, twenty thousand dollars, large part of which may remain secured on the property, if preferred.

Also, several small farms, from 1 to 3 miles from the village. For further particulars refer to Editor of the Rural; John W. Guernsey, Corning, Steuben Co., N. Y.; Jas. Lowrey, or Joseph P. Morris on the premises

179w3.

The Water-Cure Journal.—A New Volume.—Now is the time to subscribe.—Published monthly, in a beautiful quarto. Illustrated with engravings, exhibiting the Structure, Anatomy, and Physiology of the Human Body, with familiar instructions to learners. It is emphatically a Journal of Health, designed to be a complete Family Guide in all diseases.

Terms—Only One Dollar a Year, in advance. Address, post-paid, Fowlers and Wells, Clinton Hall, No. 131 Nassau Street, New York.

"The Water-Cure Journal holds a high rank in the science of health; always ready, straight-forward and plain-spoken, it unfolds the laws of our physical nature without any pretensions to the technicalities of science, but in a form as attractive and refreshing as the sparkling element of which it treats"—*N. Y. Tribune.* [178w4]

The Illustrated American Phrenological Journal—Devoted to Phrenology, Physiology, Mechanism, Education, Agriculture, the Natural Sciences, and General Intelligence, profusely illustrated with Engravings. Every family, and especially all young men and women, should have a copy. Published monthly, at One Dollar a year.—All letters should be post-paid, and directed to

FOWLERS AND WELLS,
Clinton Hall, No. 131 Nassau-st., New York

Young men about launching forth upon the activities of life, and anxious to start right, and understand their course, will find this Journal a friend and monitor, to encourage them in virtue, shield them from vice, and to prepare them for usefulness and success in life. The various occupations will be discussed in the light of Phrenology and Physiology, so that every one may know in what pursuit, he would be most likely to succeed.—Publishers.

PREPARED SUPER PHOSPHATE OF LIME,
BY THE UNION CHEMICAL WORKS, L. I.
HOYT & CO., Agents,
*No. 234 Water Street, and 122 West St., corner of Dey St., NEW YORK.*

A Fertilizer of the most approved quality, producing all the immediate effect of the best Peruvian Guano, with the advantage of being much more lasting in the soil—Thoroughly tested, and found to more than realise the expectations of all those who have already tried it. The best evidence of this is the largely increased demand it this season over the past year. Put up in bags of 160 lbs: barrels 250 lbs each. Buyers will please be particular to observe our brand upon each bag or barrel.

Also for sale, American and Foreign Field and Garden Seeds. English Ray Grass, Foul Meadow Grass, fine mixed Lawn Grass, White Clover, Osage Orange, &c.

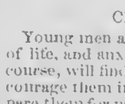
Imported Horse, "Conservation,"



WILL stand this season at the farm of the subscriber, two miles west of Syracuse and adjoining the village of Geddes. His colts and fillies are already in demand for breeding. Several have been sold during the past winter, at handsome prices, to go out of the State.

Terms.—$10 for the season, and $15 to insure; the money to be paid in advance in all cases. When a mare is insured and left at the farm of the subscriber, or regularly returned to the horse until the groom is satisfied she is in foal, a receipt will be given promising to refund the money if the mare was not got in foal. Pasturage furnished at three shillings per week. Mares to be at the risk of owners in all respects. J. B. BURNETT.

May 14. [177-tf] Syracuse, N. Y.

NORMAN HORSE LOUIS PHILIPPE!

THIS Celebrated Horse, owned by Robert B. Howland, of Union Springs, Cayuga Co., N. Y., and bred by Edward Harris, of Morristown, New Jersey, from his pure imported Norman Stock, will be kept the present season at the following places, to wit:—On Mondays, Tuesdays and Wednesdays of each week, at the stable of R. B. Robison, in Farmington, Ontario county; on Thursday, at Victor village; on Friday, at Fairport, Monroe county, and on Saturday, at Egypt.

Terms:—$8,00 for the season, and $10,00 to insure.—Mares to be returned to the Horse once a week, or until the groom is satisfied they are with foal, and to be, in all respects, at the risk of the owners. Pasturage furnished at four shillings per week. JOS. R ROBINSON.

Pure Bred Male Stock at Private Sale,
AT MOUNT FORDHAM, WESTCHESTER CO.,
Eleven Miles from City Hall, New York.

I WILL sell and let from 10 to 12 Short Horned Bulls and Bull Calves, 4 Devon Bulls and Bull Calves, and from 12 to 15 Southdown Rams. The annual sale by Auction will be omitted this year, as I wish to reserve all the Females, having recently purchased another Farm, to enable me to increase my Breeding Establishment. My Hog Stock, including all the Spring litters, are engaged.

Catalogues with full Description and Pedigrees of the above Bulls, and Southdown Rams, with the Prices attached, can be obtained by the 15th April next, from the subscriber, or at any of the principal Agricultural Stores, or from the Editors of the principal Agricultural Journals.

March 23d, 1853. 170m3 L. G. MORRIS

FODDER MAY BE SHORT!—So plant an acre or so of Carrots, Ruta bagas, Beets, and Swede's Turnips. Don't get the back-ache doing it, but use the New Hand Seed Drill, got up and sold (with the seeds for planting) at HALLOCK'S,

177tf 24 Exchange st., Rochester.

TO PRINTERS.—FOR SALE.—A quantity of good Type, consisting of about 250 lbs. of Long Primer; 250 lbs. of Bourgeous; and 150 lbs. of Nonpareil.

Also, a number of Cases, Galleys, &c., &c.

Apply at the office of the Rochester Temperance Journal. 178wtf

LOOK AT A NEW PLOW, the cheapest and best Cast Iron Plow in market, doing thorough work and of draft that takes the strain, "as easy as a small sin sits on a rich man's conscience."

# Poetical.

Written for the Rural New-Yorker.

## SPRING'S INVITATION.

Oh come, for May but blesses once the year,
And only once will follow sister June
Upon the track, before the blast will come,
To freeze out all the freshness and the glow
Of summer's reign.

It cannot be that any spirit dwells
Contented, through the spring's enticing days
To be in houses caged, when all the trees,—
The high-roofed maples and the spreading elms
Put on fresh robes, and e'en the tardy oaks
(Perchance with sly intent to stand the last
Opposed in stout resistance to the dyes
Vain Autumn introduces to the leaves
In all her bright display of fashion plates,
That mark the dying year,) array themselves,
And wave kind invitations to their shades
And still retreats.

If there are many cares
That crowd too closely in the path of life,
And gnaw too roughly on its pleasant dreams;
Come out upon the carpeted, green hills,
And bare thy scorched brow to the cooling winds
That fan the leaves; thy heart to that sweet power,
That moves unseen through all the wondrous work
Of Nature's store; or if thou hast a tear
Of any grief, o'erflowed from sorrow's cups,
Oh drop it, where the falling shower brings
As rich a blessing as the sun's glad smile.

Come out for everything;—
To laugh, till all the far surrounding wood
Shall echo and re-echo back the tone
Too loud for fashion's halls; to search in June
At leisure in the field's and forest's haunts,
For old, neglected, yet remembered, spots
Of early sports; and oh, thou child of thought,
When all the peaceful sunset's tide of gold
Goes shrinking back from tree, and shrub, and flower,
To quit the anxious, busy world of toil,
And leaving all results to him whose care
O'erspreadeth all his works, to speak the praise
The full soul renders, for the blessings given
In spring.

## THE ROYAL WHIM:

### OR THE REVENGE OF THE KING'S FOOL.

FROM THE GERMAN OF WILHELM MELNHOLD.

(*Concluded.*)

The unhappy father waited in vain for a letter from his son from one week—from one month to another. The captain had taken all necessary precaution. No one knew what had become of him, and although it was so very difficult, on this very account, to claim him, still both pastor and patron attempted it, though, as may be easily imagined, in vain. After repeated petitions to his royal majesty, they at length received a very harsh reply from the minister of war himself; that they made a most insane request in asking them to look for a recruit in the ranks of the whole Prussian army, when no one, not even themselves, knew where he was; and he must be getting on well or else he would have written to them.

Two years thus elapsed, without the disconsolate father, who had long since received a young curate to assist him, hearing the least news about his son, and therefore supposed that he died through the cold on that frightful evening, or at the halberts.

At length, when the second year had just ended, he received a message from the neighboring town to say that his son was in good health, and intended to visit him that same evening in company with the lady of the Dean of P——. When their joy at this unexpected news, which appeared to the old man almost fabulous, was moderated, and a thousand questions asked of the messenger, no one could certainly furnish any explanation as to his strange companion; but this was their least anxiety. "The dean's lady," the old mother gave it as her opinion, "will soon be tired of us." And long before evening the whole family set out to welcome their Joseph, as the old man called him. They had just arrived at the cross-road we have already visited, when a carriage drove up, out of the window of which a charming little white hand was stretched, and a silvery voice uttered the words, "Yes, yes, dear Carl, here it was that you saved me from the wolf." At the moment he looked out he recognised his parents. A cry of joy burst from him, which was echoed by the whole family. The coachman was bidden to stop, the lady and gentleman sprang out, and it was some time before the old father could say, "Now, then, tell us all, you wicked boy; you caused us much grief by not writing a single word."

"I could not, I dare not," Carl replied.—"The captain made me pledge my honor that I would not send you any news of my place of abode. If I kept my word, he promised to give me my liberty at the end of three years."

"And the worthy captain set you free at the expiration of two," his father remaked.

"Not he," Carl replied. "Death alone could have saved me from his clutches. I owe my liberty to our glorious king."

"Tell us—tell us how," all cried; let the carriage drive home."

"Yes," the patron cried who had come to share in the general joy, "send the carriage away. I must know all about it. We will take our seats on this bank."

All—among them the dean's lady, to whom no one had yet paid any attention—seated themselves on the grassy couch, and kept their eyes fixed on the young man, who wiped away his tears, and then commenced thus:

How badly I fared, and how grieved I was at not being able to send any news to my dear parents and sisters, I need not tell you. My only trust was in God; for, had I not had Him to support me, I should have acted like a hundred others—either deserted or put an end to my life. But my faith, which daily found nourishment in the beautiful text with which I quitted you on that night of terror, "We know that all things work together for good to them that love God," supported me in all my necessities.

Thus it happened that, just fourteen days ago, I stood as sentinel in the grand corridor of the royal palace at Berlin. I was thinking, as usual, of home, and as I felt very low spirited, and, besides, fancied the neighboring apartments unoccupied, I commenced singing that sweet song of Freelinghausen. "My heart should feel contented;" when I was singing the third verse, a door opened to my great embarrassment, and I saw this lady's head.

"Ah! the dean's lady," the old pastor said, as he bowed to her. "Now I am beginning to see more clearly into matters." And he straightway poured forth a multitude of apologies for not having noticed her before, through his immoderate joy at his son's return.

"But, father," the son inquired, "do you not recognise the lady?"

The old man, however, and his wife, had long forgotten the features. One of Carl's sisters at length said:

"That must be the young lady, if I am not mistaken, whom you saved from the wolf?"

"Certainly," Carl replied, "and at this very spot where we are now sitting so happily together."

But as all began crying "Proceed, proceed with your story," he continued it in the following fashion:

As soon as I saw the head I was in great fear, and ceased singing. The lady, however, came very kindly towards me, measured me from head to feet, and at length said:

"I could scarce believe my ears when I heard that voice, but my eyes cannot deceive me. Surely you are the son of the clergyman of H——, who saved me from the wolf two years ago?"

"I am that unhappy man," I said to her; and then proceeded to tell her what a frightful revenge Gundling had taken. Her eyes filled with tears, and she seemed to me like an angel sent from on high to comfort me.

"You saved me from a wolf," she exclaimed, "and I will now do as much for you;" and then hurried back into the room. I stood there with a beating heart, till a page approached me with the words:

"Sentinel, as soon as you are released from duty you must go through that door, and present yourself to her majesty the queen."

I need not say with what anxiety I waited for the hour.

At length I was relieved, and, trembling, I entered the queen's apartments. She asked my history very graciously, and when I had finished it, she added:

"I can do nothing for you, my son, but will beg the general to see that you are on duty here to-morrow morning between eleven and twelve, the hour at which the king pays me a visit. Then sing, with your clear voice that pleased me so much, any verse you like of his majesty's favorite hymn—'Who puts his trust in God alone.' I will then see what more I can do for you."

With these words her majesty dismissed me, and without the door I met this lady, who whispered to me, "Courage, courage; I trust all will be well."

As I expected, I was placed on duty before the queen's apartments the next morning at eleven o'clock. As soon as I heard voices within I commenced singing a verse of the hymn that had been commanded.—However, I expected in vain to be summond again. The hour passed, and I fancied that no attention had been paid to me; and I despaired, for I did not dare sing another verse.

"And yet," the young lady here interrupted the narrator, "all proper attention had been paid to your hymn, and I may be permitted to give an account of it, as Carl has already become my dear husband."

Another cry of astonishment was here raised; "What! what! your husband?" all exclaimed. "I fancied you were a dean's wife," the old pastor remarked. "I never heard of such a thing," the patron murmured, for he knew the lady was of a very old family, and both he and the pastor seemed scarce to know whether they were awake or dreaming.

"You must then hear my story," the young lady remarked, with a smile.

The voice delighted both their majesties greatly, and as soon as I perceived this I began saying everything I could in favor of the young man without, till the king laughed and said:

"Why, she must be in love with the fellow."

I felt that I blushed at this remark, but still answered boldly:

"Yes, your majesty, for he saved me, two years ago, from a frightful wolf."

"Diable!" the king added. "You are of a very old family, and might get a lieutenant, as far as I know."

Here the queen interposed, and begged his majesty, who was in very good humor that day, not to torment me farther. I had opened my whole heart to her, and was determined on having this grenadier, or no one else, for my husband. "I must beg your majesty to remember," the queen continued, "how carefully this good girl attended to our child in its last illness."

"Well!" the king remarked, "we'll see. The captain praises the fellow; but still she cannot by any possibility marry a simple curate. Well, as I said, we'll see. I'll examine the fellow myself; but *apropos* suppose he will not have *you?*"

I did not know what answer to make to this inquiry, save by letting my eyes sink on the ground; but the queen came to my assistance by saying, "Your majesty will be best fitted to arrange that matter."

"Well, that's very true," the king replied. "We'll see, then; the fellow will not be such a fool as to refuse." And with these words his majesty left the room, apparently in deep thought.

"That is the end of my story," the young lady said, "and my husband must proceed with his now."

Carl, therefore, continued:

I naturally believed that I had been quite unnoticed, especially as nothing of the slightest importance occurred during the remainder of the day that might nourish my hopes.

The next morning, however, at parade, the king cried out, after he had finished all other affairs.

"Where is the fellow who stood as sentry yesterday morning between eleven and twelve, at the queen's door? Let him step out the ranks."

With a beating heart I obeyed this order, on which his majesty, without moving a feature, first measured me from head to foot, and then said, "Two under-officers here—take the fellow's coat off!" I could fancy nothing else than that I was going to be tied up to the halberts for my unseasonable singing, and therefore began tremulously, "I implore your majesty, with all submission ——;" but the king interrupted me: "Don't argue—take his waistcoat off!" The under-officers did what they were commanded, and the king in the same tone, and without moving a feature, said—"Now his gaiters!"

I now fancied I was going to be impaled, at the least, and entreated in my fear—"I beg your majesty, on my knees, to be merciful to a poor fellow;" but the same answer was given me—"Don't argue."

As I stood there, in my shirt sleeves, the king ordered—"Now, bring that black chest hither to the front."

I was now certain of death when I saw this chest brought up, in which I fancied an executioner's sword, at the very least, was contained. I clasped my hands and commended my soul to God, when the king, before whom the chest had been deposited, cried out to me, "Now look in, and see how that suits you."

As soon as I raised the lid, I saw, not a sword or any instrument of torture, but a black clerical dress, and the bands laid on the top of it. The change in my feelings almost took my senses away, but the king's voice again aroused me, "Now, dress yourself immediately, and listen to what I say. Bring four drums here, and lay a dozen side arms across them, so that he cannot tumble through. The grenadier shall preach us a sermon, for I must first examine him, and see if he has learned anything. If he sits firm in the saddle, as the saying is, he can keep the black stuff, and all it contains; but if he's a stupid ass, I'll make him put the coatee on again. Now, then, up on the drums; you need not give it to us long, but it must be good."

Assuredly (the young man continued) I should have talked nothing but nonsense, through the agitated nature of my feelings; and the fact that such a terrible alternative was offered me; but to my great good fortune, during the whole duration of my wretched servitude, I had daily thought of my favorite text, and determined I would preach from it the very first Sunday after my release. In fact, from continually thinking on the subject, I had the whole discourse long before ready in my mind. I therefore boldly mounted the drums, and began immediately with the words—St. Paul says, in Romans VIII. 28, "And we know that all things work together for good to them that love God;" after which I gave a detailed account of my own misfortunes which had worked together for good by the confirmation of my faith, and then made an universal and particular application of it.

I noticed that the king, who stood next to me, and never once took his eyes off of me, could not keep the tears from pouring down his cheeks; and I had scarce uttered the word "Amen," when he said to me, "Now, come down from your pulpit; you can keep the black coat and all it contains. You had better inspect the pockets, and see what you have got in them."

During my discourse, I had noticed that one of them seemed heavier than the other. I therefore put my hand into that one first, and who could picture my astonishment, when I drew out a gold *tabatiere* filled with ducats. I was silently regarding it, when the king said—"That is a present from my wife; but now look and see whether there is anything in the other pocket;" and, not yet able to utter a word, through surprise, I drew out my appointment as dean, signed by the king's own hand.

"How is that possible?—such a thing was never heard of!" the old pastor exclaimed, as he raised his hands to heaven. "My son a dean? A candidate and private in the grenadiers a dean? Yes! now I understand why you sent to tell us you would visit us in company with the dean's lady. But not to ask your poor old father to the wedding,—as if you were ashamed of him,—that is unpardonable."

"Did I know anything about my marriage?" the son continued; "but listen, father."

I naturally tried, after all these fabulous events, to murmur out my thanks, but was interrupted by the king, who said—"Now, come up to the palace; you can eat your soup with us, and the regimental chaplain must accompany you."

Giddy with the thought of all that had happened, I followed with the chaplain, who was hardly less astonished than I was, the king and his suite to the palace; and as soon as we entered the audience room, where all the court was assembled, together with her majesty and this young lady, the king advanced, and asked me:

"Whom does he think he has to thank for all this?"

I answered, with a low bow:

"Besides God, my most gracious king and his most illustrious consort."

To which his majesty remarked:

"There he's right; but look ye here, this young and charming woman did the most for him. Has he nothing to say to her? She is not proud, and I know not married. What does he think of it; he's now a dean, and has his pocket full of ducats. Will he try his luck, and fancy he is all alone with her?"

Half mad with joy and hope, I raised my eyes and looked at the poor girl, who was blushing and trembling before me, and who could not raise her eyes from the ground.

All were silent, though at intervals a slight sound of laughter could be heard in the room. In spite of all my good fortune, I was even more embarrassed than I had been an hour before, when forced to mount the drums; but I collected myself, and in a few moments said:

"His majesty, the king, to whom I owe all my good fortune, has inspired me with courage to ask you before this great assembly, whether you will accompany me in my wanderings on the troubled path of life, like the angel Raphael formerly guided the youthful Tobias?"

She immediately gave me her hand, silent and trembling, which I pressed with ardor to my lips, and her majesty had scarcely bidden God to bless us, when the king added:

"Regimental chaplain, come hither and marry them. Afterwards we'll have our dinner; but I must get them off my hands to-day."

The chaplain, with a deep bow, remarked:

"It is impossible, your majesty; the young couple have not been asked in church."

"Nonsense!" the king objected; "I *asked* them myself, long ago. Come, and marry them as quickly as you can, for I am hungry. Next Sunday you can ask them in church as many times as you like."

Although the chaplain urged various reasons, all was of no avail. The marriage took place that very hour, and my parents can now see why it was impossible for me to invite them.

"I really must be dreaming," the old pastor now said; "why, it's stranger than any story in the 'Arabian Nights.' A grenadier made a dean! But what did the members of the consistory say to it? I cannot imagine."

"*They* kept me so long," the young man replied, "or I should have come to share my joy with you eight days ago. I had scarcely announced myself, and handed in my diploma with a request to be ordained, when the gentlemen, as may be easily conceived, declared the whole affair impossible, and sought to demonstrate this to his majesty in a long petition. The king returned it with these words, written with his own hand, on the margin:

"I have examined him myself. If he does not understand Latin, he can afford to keep some one that does. I do not understand Latin myself.

"FREDERICK WILLIAM."

"As they did not dare to trouble the king again in the matter, they proceeded to ordain me, after an examination, to which I voluntarily submitted."

The young man thus ended his story, and our kind readers can easily imagine the rest. We need only add that our hero made an excellent dean, and for many years held the living of P——.

In conclusion, we are bound to state that the above anecdote is historically true, and that we have merely repeated the family tradition. Still we thought it better to refrain from giving the real names, as the descendants of our illustrious grenadier might not desire the story to be publicly known in connection with themselves.

GOOD ADVICE.—A lawyer in one of the newly settled Western States was so extremely metaphorical upon an occasion, when the stealing of a pig was the case in point, that at last he got to "corruscating rays." The judge (who appeared equally metaphorical himself) thought proper to pull him up, by saying: "Mr.——, I wish you would take the feathers from the wings of your imagination, and put them into the tail of your judgment."

## GEOGRAPHICAL ENIGMA.

I am composed of 21 letters.

My 10, 17, 8, 5, 20, 5 is a country in South America.

My 6, 3, 8, 16, 19 is a river in France.

My 5, 13, 11, 8, 10, 17, 5 is one of the West India Islands.

My 4, 5, 6, 2, 8, 20, 10, 1, 12, 9 is a country in Texas.

My 17, 13, 8, 15, 20 is a town in Missouri.

My 4, 7, 8, 21, 3 is a river in Michigan.

My 14, 5, 8, 16, 3 is one of the United States.

My 15, 6, 6, 5 is a mountain in Turkey.

My 18, 3, 5, 11, 2 is a county in Ireland.

My whole is the greatest architecture of the age.

E. H. B.

Murray, N. Y.

**IMPROVED SWINE FOR SALE.**

THE Subscriber having been engaged twenty years in rearing and breeding swine, has finally produced a breed equal, if not superior, to any in the United States, for both pedigree and quality. They are bred from the best specimens of Leicestershire, Lincolnshire and Byfield,—the last cross from a pure Suffolk. A description of them would be—a pure white, having not a particle of black scurf on the skin, great length of body, holding their size well from end to end, small heads and legs, the pork of the finest texture, having very thin, tender skin. With regard to fattening, they are always ready to kill from three weeks old; if well fed they attain a weight of from two to three hundreds pounds at nine months old.

The numerous applications for my stock of hogs for several years past, has induced me to breed largely the past year. I have about one hundred pigs at present for sale, and shall continue to breed them at all seasons of the year, having conveniences for so doing. I will ship them to any part of the United States, by railroad or canal, carefully boxed and labeled, with sufficient feed. The prices will be from ten to fifteen dollars each, at from six to ten weeks old. GEORGE SHEFFER.

Scottsville, Monroe Co., N. Y., May, 1853. [178w4]

**GARDEN AND FIELD SEEDS**

*From the New Establishment of Van Zandt & Bowdish,*
No. 111 State street, Rochester, N. Y.

CAN be purchased of the merchants generally throughout the country, in Papers or Packages, on the most reasonable terms. Also at the Agricultural Warehouse of E. D. HALLOCK, No. 24 Exchange street, near the Clinton Hotel, Rochester, N. Y.

The Seeds from this establishment can be relied on as being of the very best quality. They are mostly imported, or grown by the EASTERN SHAKERS, and are warranted.—Full directions for cultivation printed on each Paper and Package. VAN ZANDT & BOWDISH.

Rochester, N. Y., 1853. 170m6.

**FERTILIZERS.**

PERUVIAN GUANO,.....$15 per ton.
Super Phosphate of Lime,.....2¼ cents per pound.
Bone Sawings, or Meal,.....$2.50 per barrel.
Turnings and Crushed,..... 2,25 " "
Pulverized Charcoal,..... 1,00 " "
Plaster, Ground,..... 1,12½ to 1,25 do.

Rochester, April 15, 1853.

**MARSHALL'S BOOK BINDERY,**

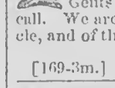
BURNS' BLOCK corner of State and Buffalo street, over Sage & Brother's Bookstore, Rochester, N. Y.

Music Books, Pamphlets, Periodicals, &c., bound in plain and fancy bindings; old books rebound; Blank Books ruled to any pattern, and bound to order; Public and Private Libraries repaired at short notice. Packages containing directions for binding, punctually attended to.

N. B.—All work warranted, and done at low prices.

April, 1852. [122tf] F. H. MARSHALL.

**MORGAN HORSE "GEN. GIFFORD."**

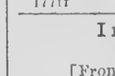


THIS justly celebrated horse will be kept the present season at Lodi Village, Seneca Co., New York.

Gen. Gifford received the 1st Premium in the class of Morgans at Rochester, in September, 1851, and is regarded by experienced horsemen as the best living specimen of this invaluable breed;—is a perfect model in form, a sharp goer, and style and action unsurpassed. Terms of insurance, twenty dollars. CHARLES W. INGERSOLL.

Lodi, April, 1853. 174w8

**GREAT PRIZE MEDAL.**



THE WORLD'S FAIR AT LONDON, awarded us a MAMMOTH SILVER MEDAL for the BEST HATS.—Gents wishing the Spring and Summer style, will call. We are prepared to serve you with a superior article, and of the most becoming style.

CLARK & GILMAN, 23 State St.,
[169-3m.] Rochester N. Y.

WHEN CORN'S PLANTED, WEEDS BEGIN TO START.—Get a good Cultivator, made to expand or contract to suit the times. They are death on weeds; and without elbow grease, will keep the soil mellow, and fill the crib in Autumn. Sold at

177tf HALLOCK'S 24 Exchange st., Rochester.

**Important to Farmers**
**PORTABLE MILL.**

[From the Ohio Farmer, December 2, 1852.]

ROSS' IMPROVED PATENT CONICAL BURR MILL STONES.—Our readers will many of them remember that Ross Portable Burr Stone Mill took the First Premium at the Annual State Fair, held in this city a few weeks since.—This admirable invention must commend itself to every one who has witnessed its operation. In the first place it is easily portable, simple in structure, does not easily get out of order, and does its work with great rapidity and perfection. It may be used for grinding the coarsest food for cattle, or the finest meal for family use. It is also well adapted for grinding wheat, rye or buckwheat. It is indeed a perfect grist mill in miniature, and we would advise every farmer, if possible, to procure one. The expense of one of these mills, with the apparatus for horse power, can not be very great; or a number of farmers might club together and procure one, which would be sufficient for all.

Mr. Ross is, we believe, a resident of Rochester, N. Y.

N. B.—Any further information relative to the Conical Mill can be obtained by letter, post-paid, or by calling at the factory of CHARLES ROSS,
2d story Phenix Building, Aqueduct-st.,
151-tf opposite the Arcade, Rochester, N. Y.

**MOORE'S RURAL NEW-YORKER:**
A WEEKLY HOME JOURNAL,
**For both Country and Town Residents.**

PUBLICATION OFFICE,
BURNS' BLOCK, CORNER STATE AND BUFFALO STS.,
ROCHESTER, N. Y.

**TERMS, IN ADVANCE:**

TWO DOLLARS A YEAR—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club.) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

**Terms of Advertising**

ONE DOLLAR per square (ten lines—100 words, or less,) for each insertion,—*in advance.* ☞ The circulation of the NEW-YORKER is much larger than that of any other newspaper published in the State, out of New York city. Only a limited space, however, is devoted to advertisements, and hence preference is given to those most appropriate—such as the cards and notices of dealers in Agricultural Implements and Machinery,—Horticulturists and Seedsmen,—Booksellers and Publishers,—Inventors, etc. All orders by mail should be accompanied with the cash.

To enable us to accommodate as many as possible, brief advertisements are preferred. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

**THE WOOL GROWER AND STOCK REGISTER.**

THIS is the only American Journal primarily devoted to the interest of Wool and Stock Growers, and should be in the hands of *every owner of Domestic Animals.* It is ably conducted, published in the best style, and finely illustrated. Each number contains a careful Review of the WOOL and CATTLE MARKETS, and much other *useful* and *reliable* information which can be obtained from no other source. The Fifth Volume commences with July, 1853.

TERMS:—FIFTY CENTS A YEAR; Five Copies for $2; Eight for $3; Eleven for $4. Back volumes, bound in paper, at 40 cts. each,—unbound at 35 cts., or three for $1.

Published monthly, in octavo form. Specimen numbers sent free. Money, properly enclosed, at our risk.

Address D. D. T. MOORE, Rochester, N. Y.

### Progress and Improvement.

### CORN CULTURE.—STIR THE SOIL.

THOUGH corn planting was somewhat delayed, in many instances, by the long continued May rains, it has since sprung up vigorously, and, by its rapid growth seems to promise a good crop of this important cereal. A few suggestions as to its cultivation are now in order, though the "first hooing" will probably be accomplished before this reaches our readers. No plant better repays constant and thorough cultivation, hence a new reminder to this effect may not be useless.

Hilling corn has nearly gone into disrepute, but it is still sometimes practiced.—As good crops, however, can be raised by flat culture as by the more laborious and expensive process. Let the field be carefully planted in rows each way, and nearly the whole dressing may be given with the horse cultivator. It should be passed between the rows as near the hills as possible, crossing both ways, and the field will be left level and mellow. A man following with a hoe can rapidly straighten or uncover the stalks which are disturbed, and an acre can be thoroughly weeded sooner in this way, than in any other.

In flat culture but one set of roots is produced, and these grow long and large, so the stalks are as well or better supported against the effects of wind than by raising a few inches of earth about the roots. The growth is more steady also, as the vigor of the plant does not need to be expended in producing new roots, at a time when all its energies should be given to extending those first produced, which are amply sufficient for the support and growth of the plant.—It seems reasonable also, that a flat, mellow surface will enable it better to withstand drouth than one ridged and hard, and less absorbent.

It is sometimes desirable to seed a corn field immediately to grass, for meadow or pasture. In flat culture this may be done readily,—sowing the grass seed after cultivating the last time, in July, and cutting the stalks as near the ground as may be when gathering the crop. A good growth will follow the next year, as thrifty as when seeded upon any other grain. Thus it will be seen that flat culture is preferable for facility of seeding down; for steady, vigorous, and productive growth; for security against high winds; for resisting the effects of drouth; and above all, for economy of labor.

Our heading contains an injunction to "stir the soil." This should be done often and thoroughly in the first stages of the growth of the corn crop. In the first place, clean culture is particularly indispensable. Weeds and grass should not be allowed to waste the elements of fertility, which the corn plant would so readily appropriate.—When the soil is well prepared and kept mellow, the roots reach far and wide for food—the plant being a rapidly growing and hungry one. Secondly, frequent culture promotes the growth of the plant by increasing the power of the soil to absorb moisture, and other needed stimulants from the air. The aid derived from this source can scarcely be overrated. In the heaviest dew a hard dry path will remain dry, while the grass or light soil at its side will be full of moisture. In garden culture, to "stir the soil" is a prime article in the creed of the practical gardener. He finds it of the utmost importance to keep the soil fresh, porous and light for the production of all rapidly growing vegetables. In the last place, a mellow soil has a greater capacity to resist drouth than any other. This has already been shown, and no one who looks at the subject for a moment, will fail to see in these and many other respects the wisdom of the injunction to "stir the soil."

### IT PAYS TO USE MANURE.

THAT it pays to use manure, the success of a farmer in Centreville, Md., abundantly proves. He purchased a farm in 1844, which had previously produced scarcely enough to support a family, and in the nine years which have since elapsed, he has used 10,998 bushels of ashes, 17,865 bushels of stone lime, and 9,700 of shell lime, besides street manure, in all costing $3,224 68. In 1844, the produce of the farm sold for $491,58, and it was gradually increased until 1852, when it sold for $3,504 47. The sales of the nine years amount to $16,215 20, or $12,390 52 over and above the cost of the manure. At the rate of the yield of 1844, the aggregate sales of the 9 years would have amounted to only $4,424 22, so that he has a clear gain from increased produce of $8,566 30, by the application of manure for nine years. The increase of labor employed should also be taken into account, but even then, a handsome profit is shown from the use of these fertilizing materials.

These figures speak for themselves, and render comment scarcely necessary. An increase of over $3,000 in the produce of a single farm, from the addition of manure, is certainly a convincing argument.

### MR. REDPATH ON DRAINING.—THE CORRECTOR CORRECTED!

I'll teach you differences.—*Shakspeare.*

MR. EDITOR:—Your correspondent 'HIEL, whilst he reads a pretty homily on the "correction of mistakes," both in theory and practice, finely illustrates the truth of the old adage, that it is easier to find fault than to correct errors. The whole drift of his diffuse letter is to prove that I am in error in stating, that the roots of wheat will penetrate to the depth of 6 or 7 feet below the surface. His own opinion is, that "it must be utterly impossible that a weak plant having a 'natural' life of only 10 or 11 months, could strike down its roots more than a *fourth*, and most probably not more than a sixth or seventh part of six or seven feet."

Your correspondent's deliberate opinion then is, that wheat plants cannot possibly strike down more than one foot from the surface, and this idea (for it is not a fact*) he endeavors to bolster up from analogies drawn from forest trees and the Canada thistle. The comparisons are utterly inapt, and the conclusions drawn are ridiculous. A tall forest tree of a hundred years growth and a slender wheat plant, are made to undergo a kind of arithmetical operation, thus:—If a forest tree 100 years old only strikes down its roots the half of six or seven feet, how deep should a wheat plant strike down its roots in 10 or 11 months?—Answer, according to 'HIEL's arithmetic, 12 inches. Such a demonstration is worthy the attention of Vegetable Physiologists.—If the analogy between the roots of the forest tree and the roots of the wheat plant hold true, it follows very naturally that a corresponding ratio may be established between the trunk and branches of the one and the stalks of the other. Assuming five feet as an average height to which it will attain during the "natural life of 10 or 11 months, the operation might be conducted as follows:—If a wheat plant rise in ten months to the height of five feet, to what height ought a forest tree to rise in 100 years? Answer—600 feet! Both conclusions are erroneous, because both are based on false data.

That the roots of wheat penetrate to the depth of 6 and 7 feet below the surface, according to the kind of grain, or the quality of the soil, I have been convinced of for more than 20 years; and so late as 1850, I verified it by actual measurement, when I found roots penetrating through a stiff clay, such as is used in making bricks, as deep as *ten feet below the surface.* Why your correspondent, being, as he says, a practical man and of considerable experience, should be ignorant of this well established fact, is a matter of wonderment to me, as its announcement was matter of astonishment to him. But why this astonishment, sir, in your correspondent? If farmers, young or old, would only take the advice of the poet and

"STUDY NATURE; nature is a friend to truth,"

and avoid all guesses and surmises, wonder would give place to devout admiration of the wisdom and goodness of Him who has "done all things well"—who has caused a slender plant, producing the staff of life, to penetrate its tender roots to an inconceivable depth, thence to draw its nourishment in a season of drouth—when "the earth becomes as iron, and the heavens as brass."

But why this astonishment, as if I had propounded some new disclosure? There is no novelty in the matter; it is as old as ADAM. If your correspondent will examine the Genesee Farmer, page 302, Vol. XII, and an article in the RURAL, Sept. 9th, of last year's issue, by LINUS CONE, Esq., he will see how his ideas and Mr. CONE's agree with regard to deep tillage, &c. In the Farmer, it is stated that "the depth to which the roots of wheat, corn, clover, &c., penetrate the earth under favorable circumstances, is much greater than is generally supposed. We have seen roots of wheat, under ordinary cultivation, that were upwards of nine feet long; and it is supposed that clover roots descend lower than wheat, though on what evidence we know not."

The strawberry, according to the testimony of the late Mr. DOWNING, (I quote from memory,) penetrates downwards no less than 10 feet. And even the Canada thistle (whose monthly decapitations afford so much employment to your correspondent,) roots penetrate to the depth of from 14 to 18 feet; hence its "tenacity of life." This is a fact from actual measurement.—By the way, in thinking of eradicating the Canada or common thistle, I have seen salt used as a means of destroying these farmer's posts. When the top was cut off, about a table spoonful of salt was dropt on the root, which generally causes it to rot and die. It is not expensive, and might be tried on a small scale, as an experiment.

In conclusion, your correspondent says: "I believe it is generally understood that, in the ordinary soils of the Genesee country, neither root nor seed ever die, or would grow if buried to the depth of 6 or 7 feet below the surface," &c. Yes, indeed, any man may believe that, not only in the Genesee country, but in any other country, without overstraining his credulity. Did your correspondent never hear of what may be called VEGETATION POINT?—a point beneath which if seeds, &c., are placed, they will neither germinate nor grow. This point is generally considered to be about 18 inches beneath the surface.

Thus, I have written in justification of the doctrines propounded, incidentally, in my Essay on Draining. I have no wish to go astray myself, far less to lead others, especially the young or the inexperienced. To them we would cordially recommend the study of Dr. ROGET's valuable work on Animal and Vegetable Physiology, wherein the wisdom, goodness, and power of GOD are strikingly illustrated as displayed in the works of Creation. Yours, &c.,

N. DAVIDSON REDPATH.

Michigan, June, 1853.

*Your correspondent either does not know, or at least makes no distinction between a *statement* and a *fact*. After making some of the most erroneous assertions regarding vegetation, he sums up by saying, "These *facts*," &c. The least consideration will convince any one, that whilst every *fact* is a *statement*, every *statement* is not necessarily a *fact*. A fact is an incontrovertible truth; a statement may be either true or false. It is related of Charles II., of England, of detested memory, that on one occasion he exclaimed, "I deny the *fact*!" Now, Mr. Editor, I deny 'HIEL's *facts*, simply because they are no facts, but erroneous statements, founded on false notions of the very first principle of Vegetable Physeology. To him, we would recommend (although, "to teach a teacher, ill becometh me,") CRABB's ENGLISH SYNONYMS EXPLAINED, as a guide to his English; and LEIBIG, JOHNSTON, ROGET, or any other available works on Agricultural Chemistry and Vegetable Physiology, as instructors in these important branches of Rural Economy.

### CLIMATE.—NO. IV.

IT is generally much easier to expose an existing evil than to show how to remedy the evil, or even how to mitigate its effects. And in giving my opinion in regard to this matter, I shall only attempt an approximation to a systematic course of prevention in certain specified cases. In truth, the difference of soils, climates, aspects, &c., &c., of the various parts of the country are so great that it is impossible to indicate any general system which will be applicable in any considerable number of locations. A course of farming which would produce the best possible effect in one case, in all probability, would utterly fail in another, *even upon an adjoining farm.* A highly recommended (and no doubt a successful,) remedy in one instance, frequently entirely fails in producing the same result, in any other instance. A late most eminent chemist, says:—"In devoting the different parts of an estate to the necessary crops, it is perfectly evident, from what has been said, that no general principle can be laid down, except when all the circumstances of the nature, composition, and situation of the soil and subsoil are known. The methods of cultivation likewise must be different for different soils. The same practice which will be excellent in one case, may be destructive in another." If he is correct, (and I know, from more than *forty* years experience, that he is,) how absurb to suppose that a "pattern farm," in any part of the State would be of the least possible service in indicating the proper course of farming in other parts of the country, not one of which would probably be in consonance with the "pattern," to climate, aspect, or "composition of soil, or subsoil?"

Having previously mentioned peach orchards, &c., I will give the results of my observation (and I might also say, my *experience,*) in regard to them and a few other products of the farm. In planting an orchard, since the face of the country and the climate have become so materially changed, I have observed that a "*ridge*" was a better site for it in general, than a *flat*, the fruit being much less liable to be injured by frosts. The trees are more certain to grow well, and to remain in bearing much longer, if the seeds are *planted where the trees are to remain, without transplanting.* The *north* side of a wall, or *fence,* is a better location than the *south* side; because the buds are not so apt to be brought forward so early as to be destroyed by winter or spring frosts. A high and steep hill, on the north side, however, may form an excellent shelter for an orchard. The exhaustion of the vegetable mould of the soil requires that a much more energetic practice in cultivating and manuring the ground should be adopted than was formerly necessary.

It may seem to be an act of presumption in a "clod-hopper" to differ with learned "savans" upon the subject of the "Potato Rot." Having, however, some *practical knowledge,* which few (if any,) I conclude, who have promulgated their crude hypotheses have had, "I, also, will show mine opinion." From many and laborious investigations in my own potato grounds, I am perfectly satisfied that the cause of the "Rot" is an unusal degree of heat (during the time of the growth of the plant, thereby making it *more tender,* and therefore much more easily destroyed than when the plant is of more slow growth,) and more particularly, at the time when the plant is elaborating the sap, and forming the tubers. The objection that "in northern climates, such as that of Russia, &c., the "Rot" prevails as well as in this country, "is of no force; for it is well known that, in those northern countries, the heat is, oftentimes, more severe, in the summer, than it is in more southern latitudes. And of course, unusual degrees of heat would as certainly produce the "rot" there, as in countries farther south. As in the human body, where the blood may be vitiated and corrupted, and yet the person may continue to *live and grow,* and even sometimes to outgrow" the diseased state of the blood:—So in the potato, the sap of the plant is, to a certain degree, fermented and soured, by the excess of heat; the top dies, but the circulation of the vitiated sap from the dying top is sufficient to swell out the tuber, at the same time that it predisposes it to rot. If the excess of heat continues long enough it heats the potatoes in the earth, and they are destroyed; those *nearest the surface first,* and then those more deeply imbedded. Neither change of seed, nor reprodution from the balls, can have any effect upon a cause which thus operates *while the plant is growing, and perfecting its fruit.* 'HIEL.

### A PLEA FOR FARM LABORERS.

I PEN this evening, a few words in behalf of a class for whom thus far agricultural papers have said very little. Of the soil and animals, the sons, daughters, and wife of the farmer, we hear much—much to improve, benefit, cheer and encourage—yet, of his *hired man* we hear nothing. Nothing has been said to cheer his toil—nothing to encourage him on, and point him aright. No, nothing! And yet we can but believe that as a class, these men are as worthy of honor as many farmers' sons whom chance has shielded from such a position. When we inquire into the early biography of the wealthy farmers surrounding us, we find that many of them were once farm laborers by the month. Go into our legislative halls—inquire of our most successful merchants—of our D. D.'s—our LL. D.'s—and all others in honorable stations in society, how they commenced their career in life, and the answer will come from a respectable majority,—"*as laborers by the month,*" in shops, and on farms.

In view of these circumstances, is the position of the farm-laborer an honorable one? Many such are in the employ of men who themselves have been laborers by the month. Why then should they not be shown as much respect as their employers, or, as his sons and daughters? Who, I would ask, are their superiors? And I answer—none, but those who have made superior attainments—none merely from station in life.—And yet, some pretend to look down upon them.

How is it, brother? Do you and your family treat your hired man with proper courtesy, or do you leave him to gain the civilities his right, as best he may, wondering meanwhile that his manner is awkward and unpolished? Remember that aside from our boasted freedom, there are few things in the social condition of our country, upon which we may look with more pride, as having advanced beyond the mother country, than the elevation of the laborer in the scale of respectability. Shall we seek again to depress him? Shall we have *caste?* Are we, in republican America, to fall back upon the "time-honored," "long-hated usages" of the old world? Is the possession of wealth to constitute a superiority? Let me, then, fix the boundaries:

All who produce for their fellows, are coworkers with the Almighty, and are aiding in carrying out His plans for the general weal. They are therefore the highest class, or number one. Those who do not labor to produce any article for their own or others sustenance, or use, are the drones of the human family—a sort of worthless fungi; eating the produce of the workers and acting contrary to the will of God, His designs and commands,—these, if of moral character, belong to class number second. There is another class composed of dissipated idlers who live without work, and almost invariably mimic, hiss and sneer at young men who work by the month. This is the lowest class, or number third.

Perhaps you think I use too bitter language—language more severe than my subject would call for. Let me say to you, open your eyes! I have been a farm laborer,—I know how the thermometer ranges—I can remember when my proffered hand was not received—when my nod of recognition was unreturned. I have treasured memories of slights shown, and thrusts given, when I was only John, *our* hired man.

Then need we wonder longer, that young men are unwilling, unless necessitated so to do, to enter the service of farmers? Think you that they are destitute of pride? Then continue on in the course too many have adopted, and you will have the satisfaction ere long, of seeing that you have driven from the ranks of "month laborers" all young men of spirit, ambition, and trust.—Situations in stores and shops—any situation that is respected — California's and Australia's golden sands will be sifted—any occupation will be sought rather than serve as a menial. FARMERS, DO YOU HEAR!

What has been, will doubtless be again. From the ranks of our present bright-eyed, broad-shouldered, strong-limbed farmer boys, will go forth the first men of our nation—first in respectability—first in talent, and greatest in genuis, energy, and influence. Then I ask why trample upon them? Why not show them due courtesy and politeness? It will encourage and strengthen them to go on.

"The Jews would not willingly tread upon the smallest piece of paper in their way, but took it up; for possibly, said they, the name of GOD may be written upon it.—Though there was a little superstition in this, yet truly, there is nothing but high motives if we apply it to men. Trample not on any; there may be some work of grace there that thou knowest not of." Genius may have marked him as hers. We can not divine, when we look upon the ruddy countenance, and into the bright eye of the farmer boy, what may yet be his station, influence, and success in life? Who would have predicted that "the mill boy of the slashes" would move a nation—gain the attention of a world—and be admired and loved by millions of people, and yet this HENRY CLAY accomplished. It has been stated that of the fourteen whom our nation has honored with the highest office in our government, that twelve have made their way upward, depending upon their own resources. Be this as it may, we are surrounded by abundant evidences of what farmer boys have become, and we have but to encourage them—to respect them—to bid them press on—and we will see them enter the field joyfully—and triumphant success ere long crowning their efforts.

To my young friends, who, employed as month hands, are laboring for hire, I would say, your position is an honorable one.

"Sages and patriots in these ways have trod."

Go on then!—weary not—let idlers sneer—you are above them—are more honorable. Thousands have gone before you to stations of the highest respectability and trust.—Maintain a proper self-respect—for the sake of company, associate not with the idle nor profligate. "If sinners entice thee, consent thou not;" value a good character above rubies. Be patient—persevere, and though now poor, ere long you will have attained a position to the occupant of which they who now deign not to notice the "vulgar month hand," will be looking for an example and influence.

Take courage then my young friends—and go on—gain knowledge as it may be in your power, and when a few more years shall have passed away, you will realize in its fullest sense the grand result of being industrious and improving your early years.

By an old month laborer,

JOHN SANFIELD.

Hill Farm, N. Y., 1853.

## CONDENSED CORRESPONDENCE.

### Management of Milch Cows.

MESSRS EDITORS.—This is the first time I ever attempted to write for publication, but seeing often in the RURAL, statements about the care of cows in winter and summer, the different kinds of grain that make the most milk, &c., I have concluded to send you an account of our mode of management, which you can publish if you think it will prove beneficial to do so.

My father and I have usually kept from fifteen to twenty cows for the last six years. In summer they have nothing but good pasture day and night. In the day time we think it best to keep them in a pasture where there is running water; in the night we turn them to the dry lots, as it is not as warm, and the dew affords considerable moisture. We milk in the morning before it is too warm, as the cows stand more quietly, and about half past six or a little later in the afternoon. This does not divide the time very well, but it is better than to milk before sunrise and after dark, as this makes the time between milking twice as long in the day as at night, which must be unpleasant and injurious to the cows.—We always have the milkers pick their cows in the spring, and each one milk his or her cows the season through. It is a bad plan to change milkers, for the cows will not give down as well to a strange hand.

As soon as winter sets in we feed on hay, adding corn stalks if we have them, until, they are dry—the last of Dec. or thereabout, as we like to have them go dry three or four months. About the middle of February we commence feeding hay and meal; we have had corn in the cob mixed with rye, ground, which is very rich, but I think buckwheat is better for milk. In feeding corn and cob meal, our cows got fat and did not clean well which as all dairymen know, hurts them very much. The plan we now adopt, is, as soon as the cows begin making bag, to commence feeding them raw oats, about two quarts per day until they come in, which will loosen and clean them well. Oats will not raise their milk, so there will not be any danger of caking in the bag. We then commence feeding something to increase the milk. One more remark—we never allow a calf to suck the cow, because they will hold up their milk if we do.—S. LEHMAN, *Sharon Centre, Scho. Co., N. Y.*

### "The Birds."

"THEIR wise Creator formed them for an important use; if you destroy them, you frustrate this plan—and nature always suffers when the laws and plans of God are disregarded."—(RURAL, Vol. IV. p. 129.)

I read the RURAL with undimished interest, and no portions of it interest me more than those indicating the progress of the human mind towards what I consider a right state of feeling in regard to the "The Birds," as well as its progressive knowledge and improvement. "How do you know," asks the writer from whom "my text" is taken, "but their quick eye perceived a worm in the very cherry you grudge them?"—Two years ago I stated an incident which to my mind confirmed, or at least answered, this same inquiry, (it was published, I believe, in the RURAL,) and suggested the propriety of further observations on the same subject. I am happy now to find my opinion confirmed by the observations of T. C. PETERS, in an interesting article from his pen in No. 20, of the present Vol. of the RURAL.

"Nature always suffers," &c. I will add but two brief remarks: 1st. There is reason to believe, that although most birds live on a variety of food, yet each particular species of birds has a greater partiality, or fondness, for some particular kinds of insects or reptiles. Many examples occur, but I omit them for the present. This evinces *a plan.*

2d. Many species of birds follow civilization. The same may be said of several species of insects; or, at least, they multiply under its influence. Hence a necessity that the birds should follow, in order to reduce the number of the insects. This also evinces *a plan.* Let us, then, study and observe. No man can study "Nature's works and ways" without becoming a wiser, and a better man.—*Out West*, May, 1853.

### Draining.

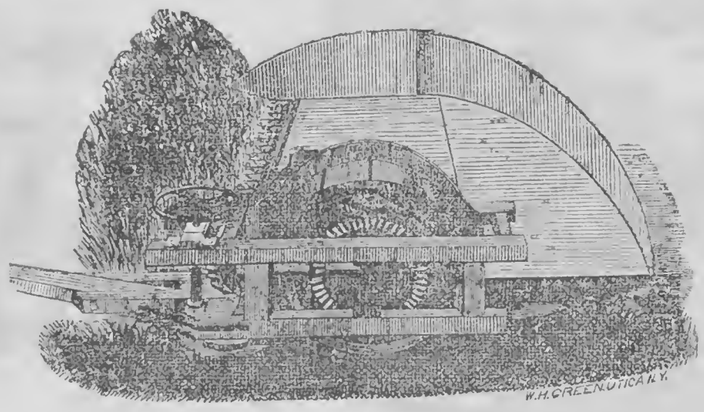
THIS is a subject of great importance to this, as well as other countries, where it has been proved. The experience of many years has satisfactorily shown its benefit to them and that it ought to be adopted by us.

There has been enough said on the subject of stone and tile drains; we have had the statements of well experienced men, and I would now introduce a substitute where these materials are hard to be got. Take oak boards, one inch thick, and six inches wide; nail two boards together in the shape of a sheep-trough. The bottom board ought to be left about six inches longer at one end, in order to break joints to keep them straight. Every three boards will require about nine nails; the bottom board may be omitted if the bottom of the drain is hard and but little water to discharge. The drains ought to be one foot wide and over two and a half feet deep; the deeper the better. I should prefer laying tiles on a board to the sole pieces generally used. I think board drains will last from 20 to 30 years. My stone drains do not last but a few years, when they get filled with quick sand, and moles are doing much damage to them. I think board drains will be very beneficial to those living on low lands where stone are scarce and timber plenty, and tiles not convenient to be had.

D. M. H.

### New Material for Roofs.

FRIEND MOORE:—On reading the article on tiling for roofs, in the RURAL, it brought to mind a calculation on roofing with bookboard, painted heavy with mineral tar and sprinkled well with sand; to which add another coat, or to any required thickness. It will become as solid as slate, not only water tight and snow tight, but air tight and warm in winter. If our calculation was correct, the expense would be a trifle less than with shingles at two dollars per thousand, allowing for the difference in nails. The joints need lapping but little, and painting between the laps, then fastening with light tacks. We should like to hear, through the RURAL, some remarks from an abler and better informed person on this subject.—D. M, *Sandy Creek, Oswego Co.*, June 4th, 1853.



BURRALL'S GRAIN REAPER.

AMONG the many Reaping Machines now before the public—each of which is claimed to possess peculiar merits—the one above represented has achieved an enviable reputation. Without disparagement to other machines manufactured and sold in Western New-York, and which we have heretofore noticed, we may here repeat what we have heretofore said of BURRALL'S Reaper, after witnessing its operation:—"We expected, from what we had previously heard, to see a good machine, but did not anticipate witnessing one so complete and perfect in its practical operation. It was not a highly finished and painted concern, but DID THE BUSINESS most effectually—and that, we take it, is just what farmers want at harvest time. Neither was it rigged for visitors, and certainly not for us, for our call at the field was unexpected—and we found it cutting oats as fast as the team could walk, and saw it operate while the horses were trotting. It runs easily, cuts every straw, is subject to little jar and noise—and is altogether creditable to the inventive genius of Mr. BURRALL, who is a genuine Western New-Yorker."

For particulars as to price of this Reaper, and where obtainable, see advertisement in this paper.

## THE AGRICULTURAL PRESS.

### Sowing Corn for Fodder.

WE find the following article in the *Albany Cultivator.* It is valuable as furnishing very complete directions on the subject:

We have cultivated corn for fodder for many years, and find it, all things considered, the most profitable we can raise. It may be sown during the comparative season of leisure just after corn planting, and secured at the next season of leisure just after haying and harvesting. After repeatedly cropping the same ground, we are satisfied that it rather enriches than impoverishes the land, no grain being framed, and a vast bed of roots remaining. Nothing is equal to it for reducing rough, turfy, weed land, to a state of cleanliness and good tilth. We believe it the best fallow crop in the world to precede wheat.

It should never be sown broadcast. The imperfections of this mode are the chief reasons that the crop has not become more generally introduced. It requires more seed, and leaves the ground in a fouler condition, than when sown in plowed drills.—We have tried both ways, to our entire satisfaction, as to the comparative value of each. The following is the best mode for sowing, cultivating, and securing the crop:

Plow and harrow the ground as for any other crop; furrow it with a one-horse plow, three feet apart; let a man pass along one of these drills with a half-bushel basket on his left arm containing shelled corn, and strew the seed in the furrow at the rate of about 40 or 50 grains to a foot, which will be about two and a half or three bushels per acre. He will do this evenly, with a little practice, as fast as he can walk. If sowed thinner the crop will be smaller.—We have found, by accurately weighing and measuring, that twenty grains to the foot yield only two-thirds the crop afforded by forty grains to the foot. Immediately after the sower, follows a man with a one-horse harrow or cultivator, or with a two-horse harrow, *lengthwise* with the furrow, and covers the seed. Two men will thus plant six or seven acres in a day.

When the corn is six inches to a foot high, run a one-horse cultivator between the rows. This is all the dressing the crop needs. No hoeing is necessary, for the dense growth soon smothers down all else; and in the autumn, when the crop is cut off, the earth is left as clean as a newly plowed field.

It is to be harvested about the first of autumn. If the crop is heavy and much "lodged," it is cut by reaping. If straight and even, a common scythe will answer the purpose, a little practice enabling the operator to throw it smoothly with the heads in one direction. After partly drying for a day or two, the best way is to tie it in bundles, and put it up in large shocks although raking by a horse into winrows for cocks, might answer well for large fields. It must dry for some weeks.

It can never be safely put into large stacks. The most perfect way would be to place it in small stacks or long upright rows, under a large shed. Even if the stalks appear perfectly cured after several weeks exposure, they will certainly heat and spoil if stacked in the ordinary way. Hence, the stacks must be quite small, freely salted, and well ventilated by means of three or four poles placed upright in the centre. We have found the stalks to retain a good condition when left in large well made shocks on the field, till wanted in winter. Curing is the only difficulty with this crop, and this ceases when understood.

Land that will yield thirty bushels of corn to the acre, will afford about five tons of dried fodder. Moist land is better than very dry, as it is more affected by drouth than ordinary corn crops. We have not found the cost, including interest on the land to exceed $1,50 per ton for the dried fodder.

For soiling, or feeding green, corn fodder, often proves of the highest value, when pastures are burnt by drouth. For this purpose, it may be sown at different periods till midsummer.

### Time for Cutting Hay.

THE *Germantown Telegraph* has the following article on this subject:

Meadow hay, if intended for winter food for stock of any kind, should never be allowed to stand until fully ripe. By remaining in the field till it becomes mature, it acquires a hard and wirey character, which ensures its being rejected by most animals when not actually compelled by hunger; and is, indeed, fit for little else besides *litter*, or bedding. By cutting—the period of inflorescence, perhaps, indicates with sufficient general accuracy, the most suitable season for harvesting—making thoroughly, and salting with from one to two pecks of salt per ton, (the quantity in all cases to be graduated in conformity to the use to which it is to be applied,) a very excellent and salutary winter food will be secured.

Sheep do well, perhaps in *most* cases much better, on this than on any other hay. They partake eagerly, and are seldom sick. In marshes appended to most of the farms, or where salt-hay can be obtained in almost any quantity, and at a merely nominal price, the wild grass of meadow and fresh bog land, possess less intrinsic value; but even then it is not by any means to be thrown away. Even if you have no use for it in your barn, it will be found an excellent article for manure. When used for this purpose, cart it into your yards green, or in a partially made condition, and spread over the surface, or else pack it away, after "making it" as hay, in some convenient and unoccupied out-building, to be thrown out occasionally during the winter, or to supply bedding for your horses, sheep, swine and other animals, and thus be mixed up with the manure for future use. But there are few places where a good crop of wild hay, will not be valuable to the farmer for feeding. In the interior, it is eminently so, and there is generally a demand for a much larger quantity of it than most farmers find it practicable to obtain. In such places, the most imperfect of the wild grasses, if properly salted, will be found to possess a high value. It is an error to suppose that long standing improves the quality of this description of hay. The earlier it is cut, after the season of haying commences, the better.

### Weeds and Weeding.

The *Working Farmer* has a chapter on the destruction of weeds by other means than plowing and hoeing:

The remedies proposed for doing away with weeds, are only exceeded in number by weeds themselves—but among the many methods some may be adopted with propriety. Some weeds of the smaller kinds are destroyed by burning a slight coating of litter on the surface of the soil, in early spring, and market gardeners so prepare soil for raising cabbage plants. Many kinds of the smaller weeds are destroyed by a coating of six bushels of common salt per acre after plowing, and a few days before planting. Some weeds, embracing quite a large class, may be done away with, by two plowings at a few weeks apart, and when the field is intended for late crops, this may readily be done.

Where a neglected corner is so full of weeds, that they cannot be got rid of by ordinary means, then salt the soil so heavily as to destroy all growth, and by losing the use of it for one year, and adding lime with with a full plowing, such salted soil will be found clear of weeds the following season and of improved fertility. The ultimate constituents of salt (*chlorine and soda*) are not unfriendly to vegetation, and they soon separate in the soil by chemical influences, and thus cease to be salt.

Root and other hoed crops enable us to get rid of many weeds, when the crops receive proper attention—thus a carrot crop, if properly attended, will secure the removal of weeds. The use of properly constructed cultivators among root crops, if used sufficiently often, will save much labor in the removal of weeds, for they will turn out every weed between the rows, leaving those only in the rows to be removed by hand or by the hand-hoe. The use of the *push* or *scuffle* hoe in skillful hands, will do much to save the soil from weeds; if applied to a proper depth in a well disintegrated soil, it cuts off the weeds, and in the back action draws them above the surface, to decay without replacing the roots. Horse-hoes are also constructed so as to cut weeds deeply, and to leave the entire weed, root and all, on the surface to decay.

Never leave weeds a few days longer, because, they are not going to seed. Large weeds seldom come forth with so much of their roots as small ones, and then their increased size robs other plants of their proper food, nor will their decay on the surface restore all they have robbed, again to the soil, for a large part of the nitrogeneus portion of their constituents will be lost in the atmosphere. Salt and lime mixture, used in composts, destroys the accidental weed seed from the stable, by assisting in their more perfect decomposition. Hog-pen manure will decompose with such violence as to destroy many, and when the divisor used is decomposed muck or charcoal braze, the ammonia is not lost even by so violent a decomposition.

### Brady's Address.—Chess and Wheat.

THE following is an extract from the interesting address of Joseph Brady, before the Franklin County (Ind.) Agricultural Society:

"It is now more than fifteen years since my father determined to raise pure wheat, instead of having it intermingled with cheat, rye, and sometimes even cockle, as he and his neighbors had been doing, and as some farmers, I am sorry to say, even yet do.—The rye, being taller than the wheat, was easily destroyed by cutting it out before harvest, and the cockle was not difficult to overcome. As to destroying cheat, many only laughed at him, assuring him that the first hard winter would undo all his labor, even if he should gain a partial victory.—Nevertheless, he was determined to make an experiment at least. I was then a youth at home, and much interested in the experiment. We picked our seed, not as one who has written in favor of the changing theory, that he did his, in a somewhat similar experiment,—"in bunches of two or three hundred heads," but head by head.—Lest a single grain of cheat might have fallen into it, we ran it two or three time thro' a fanning-mill containing a good screen, being careful that none of the screenings should be sown. We then sowed the seed, thus prepared, on the cleanest ground that we had. We went throught a similar process the two succeeding years. If a single stalk or grain of cheat was found in harvesting, threshing, or winnowing, it was carfully pocketed and burned. By that time our wheat was almost perfectly clear of it, and would have been entirely so, I have no doubt, had there been none of it in the ground from year to year. Since then it has only been necessary to exercise prudent care in the preparation of the seed to insure a crop of almost pure wheat. There was no longer any need of picking it head by head, or subjecting it to any tedious process. When we wished to cultivate a new variety, or make an interchange of seed, we had only to carefully prepare that which we sowed to insure a crop of all wheat.—Many years have passed since then, and I am confident that I may safely say, that there never has a grain or stalk changed on that farm; and, I will venture the further assertion, that there never will. It has been exposed to all the causualties that have been supposed to produce the change, but without producing the slightest visible effect.—From that day to this the same care has been exercised, and with the same success, and so careful is my father that he would at any time stop the most important farming operation to destroy a stalk of cheat. Our neighbors, seeing the result, adopted a similar practice, and with the same unfailing result;—so that the opposite theory, once generally entertained, has now few advocates among them."

He that by the plow would thrive,
Himself must either hold or drive.

HORSES IN NEW YORK.—We copy the following paragraph from the *New York Herald:*

"We find the number of horses at present in the city is 22,540, and their value $2,495,000. The number in 1825 was 5,634, when the population of New York was 166,086. This gave a proportion of one horse to every thirty inhabitants, while the proportion at present is one to every twenty-three, showing a large increase. This proves that the application of steam to the different mechanical inventions which have since been made has not had the effect either of diminishing the value of horse labor, or reducing the number, as they might naturally be supposed to have done."

AGRICULTURAL COLLEGE IN OHIO.—The friends of practical education, in Clermont county, have been moving in the matter of establishing an Agricultural and Teachers' College. The enterprise meets with decided favor among the leading citizens of the county, and we may yet be happily disappointed in seeing a truly Agricultural Institution spring up among the thriving farmers of Clermont. The undertaking is one of no small magnitude if our friends propose to establish a permanent and living school, and we hope they will sufficiently count the cost, and not add another to the whited sepulchres, with great sounding names, signifying nothing.—*Ohio Cult.*

# Orchard and Garden.

### APPLE TREE BARK-LOUSE.

This troublesome insect and its habits are not extensively well known, though many people have observed the curious appearance of the limbs upon which they are found, looking very much like a part of the bark itself. Harris, in his excellent treatise on insects, speaks of it as follows:

"Young apple trees, and the extremities of the limbs of older trees are very much subject to the attacks of a small species of bark-louse. The limbs and smooth parts of the trunks are sometimes completely covered with these insects, and present a very singularly wrinkled and rough appearance from the bodies which are crowded closely together. In the winter these insects are torpid, and apparently dead. They measure about one-tenth of an inch in length, are of an oblong oval shape, gradually decreasing, to a point at one end and are of a brownish color, very near to that of the bark of the tree.

These insects have now become extremely common, and infest our nurseries and young trees to a very great extent. In the spring the eggs are readily to be seen on raising the little muscle-shaped scales beneath which they are concealed. These eggs are of a white color, and in shape nearly like those of snakes. Every shell contains from thirty to forty of them, imbedded in a small quantity of whitish friable down. They begin to hatch about the 25th of May, and finish about the 10th of June, according to Mr. Perley. The young, on their first appearance, are nearly white, very minute, and nearly oval in form. In about ten days they become stationary, and early in June throw out a quantity of bluish white down, soon after which their transformations are completed, and the females become fertile, and deposite their eggs. These, it seems, are hatched in the course of the summer, and the young come to their growth and provide for a new brood before the onsuing winter.

Among the natural means which are provided to check the increase of these barklice, are birds, many of which, especially those of the genera *Parus* and *Regulus*, containing the chickadee and our wrens, devour great quantities of these lice. I have also found that these insects are preyed upon by internal parasites, minute ichneumon flies, and the holes (which are as small as if made with a fine needle,) through which these little insects come forth, may be seen on the backs of a great many of the lice which have been destroyed by their intestine foes. The best application for the destruction of the lice is a wash made of two parts of soft soap and eight of water, with which is mixed lime enough to bring it to the consistence of thick whitewash. This is to be put upon the trunks and limbs of the trees with a brush, and as high as practicable, so as to cover the whole surface, and fill all the cracks in the bark.—The proper time for washing over the trees is in the early part of June, when the insects are young and tender. These insects may also be killed by using in the same way a solution of two pounds of potash in seven quarts of water, or a pickle consisting of a quart of common salt in two gallons of water."

### GOOSEBERRY CULTURE.

The qualities of this fruit are too generally and fully known to need commendation. The great obstacle to its general cultivation appears to be its liability to mildew, when the fruit is one-half or two-thirds grown, a misfortune which, when it has once fallen upon it, renders the fruit entirely worthless. Yet, it is a matter of congratulation that this evil, in most cases, is not without a remedy, and arises, probably, oftener from over exertion in cultivation than from any natural cause. We infer this from the fact that the shrub is found growing spontaneously in nearly all the northern parts of the Union and in the Canadas; and that, when found so growing, the evil we lament is not to be met with. When growing wild, it is often found in cool, moist places; consequently giving it a locality similar has a tendency to prevent disease. We have found proof to sustain this fact in our own experience.

Some dozen years ago, a friend gave us some bushes of a very fine variety, which he was about to remove from his garden on account of mildew. They were placed by us in a moist, cool soil, and the second year produced an abundant crop of large, delicious berries. Such crops were given for some seven or eight years, when the mildew again attacked them. Supposing an exhaustion of soil might have something to do in the matter, we gave some a liberal supply of well-rotted manure, forking it in; and others we restored by giving a heavy mulching of leaves around the bushes in autumn. Others were removed and placed the north side of a board fence, where they were shaded from the sun from nine o'clock A. M. to three o'clock P. M., and where, of course, the ground was always moist, and comparatively cool. In each experiment we succeeded in restoring our bushes.

We would recommend the shady yet airy locality as the first best; and for the second specific, mulching every fall. If a handful of salt is applied round each bush in the spring, a good effect will be visible. We know of no cultivated variety exempt from this plague. "Houghton's Seedling," so loudly applauded as mildew-proof with us, is no more exempt than the "Roaring Lion," "Crown Bob," or any other variety. The same cause produces it on that, and the same preventives save it.—*Cor. Conn. Valley Farmer.*

### TOWN HORTICULTURAL SOCIETIES.

——"To deck the shapely knoll
That softly swell'd, and gaily dress'd appears
A flow'ry island from the dark green lawn
Emerging, must be deemed a labor due
To no mean hand, and asks the touch of taste."

Mr. Editor:—Conversing with a friend in Massachusetts, a few days ago, I was much interested with his plan for the formation of Town Horticultural Societies. Through his agency, such a society exists in Andover, Mass., which has been found both useful and pleasant to its members.—Before the existence of this society, little interest was felt in ornamental flowers and shrubs or in scientific gardening. Through the agency of a single individual, Dr. Eastman Sanborn, of that village, a warm interest has been awakened in horticulture. Dr. Sanborn is enthusiastic in the culture of fruits and flowers; and like every other earnest and true patriot, he imparts both of his zeal and his choice flowers to others.—When his neighbors see the beauty and inhale the fragrance of the beautiful products of his industry and skill, they admire his plan of creating comfort and happiness at home, and "go and do likewise." It is not enough to *see* and *smell* a beautiful flower while it lasts, one likes to have it with him; and when a person has enjoyed the society and sweet language of a single flower, he, like Oliver Twist, always "asks for more."

The Andover Society holds regular meetings, and furnishes occasional exhibitions of fruits and flowers. Each member saves seeds from his own garden, for exchange with other societies and with the Patent Office at Washington. Thus they secure to themselves the most valuable specimens of flowers, fruits, plants, shrubs, and edible roots, which the gardens of the world afford.

They may make horticulture a source of income, if they choose; they cannot fail to make it a source of pleasure. The love of flowers is one of the most innocent, pure, and healthy affections of the human soul.—There is no rivalry or loss of love in it.—The passion never decays, but actually "grows by what it feeds on." It interferes with no duties, domestic or public, but adds a new charm to both and gilds with "the purple light of love" all the asperities and inequalities of life.

The biographer of the Empress Josephine mentions it, to her credit, that she was fond of flowers; and adds that this passion in females usually indicates a gentle temper and a loving heart. If this be the fact, in relation to females, the cultivation of flowers may have very important bearings upon their prospects in life.

The formation of village societies for improvement in experimental gardening is, certainly, worthy of consideration. If our citizens are indifferent to the ornamental part of horticulture, they cannot be so, with reference to the *useful and productive* department. The berries, fruits, plums, currants and edible roots of a well cultivated garden add very essentially to the substantial enjoyments of life. They also contribute greatly to the ordinary support of a family.

The *quantity* and *quality* of these comforts of a farmer's life may be materilly improved by skill and industry. The skill may be acquired by comparing notes at a horticultural meeting and by personal experiments. The reward is certain. Let those who feel any interest in the welfare of their respective communities, consider these suggestions and resolve to act.—*Granite Far.*

### CULTURE OF BLACKERRIES.

In New England they are making a great deal of the blackberry, which bids fair to take a high rank among the smaller fruits. Hovey's Magazine, in treating on this subject, says:

Since the introduction of the improved variety, about six or seven years ago, of which we have heretofore given several accounts, and whose cultivation has been so well detailed in our last volume by Captain Lovett, who has been one of the most successful growers of the fruit, it has been very generally disseminated, and, the past year, many remarkably fine specimens were exhibited before the Horticultural Society.

The liberal premiums offered for this fruit, by the Society, have had the good effect of producing very general competition; and so superior have been some of the specimens, so much larger than when first exhibited, evidently showing what care and attention will do for this as well as other fruits; that the society have deemed it advisable to offer a high prize for a seedling, with the hope of a still further improvement, for although what few attempts have been made in this way have not been attended very favorable results, there is still good reason to believe that it will yield to the ameliorating influences of cultivation, as well as the strawberry, the goosberry, or the raspberry.

So productive is this variety that, according to the authority we have quoted, a dozen of plants, when well established, yield sufficient fruit for a family of the ordinary number. Among the berries exibited in public by Captain Lovett and others, were some over an inch and a half long."

### DECAY IN FRUIT TREES.

We have often heard the practice recommended of driving nails into decaying fruit trees, to restore their vigor. But we have never seen the result set forth so strikingly as in the following from the Southern Planter:

A singular fact, and one worthy of being recorded, was mentioned to us a few days since by Mr. Alexander Duke, of Albemarle. He stated, that whilst on a visit to a neighbor, his attention was called to a large peach orchard, every tree in which had been totally destroyed by the ravages of the worm, with the exception of three, and these three were probably the most thrifty and flourishing peach trees he ever saw. The only cause of their superiority known to his host, was an experiment made in consequence of observing that those parts of worm eaten timber into which nails had been driven were generally sound.—When his trees were about a year old, he had selected three of them and driven a tenpenny nail through the body, as near the ground as possible; whilst the balance of his orchard had gradually failed and finally yielded entirely to the ravages of the worms; these three trees, selected at random, treated precisely in the same manner, with the exception of the nailing, had always been vigorous and healthy, furnishing him at that very period with the greatest profusion of the most luscious fruit. It is supposed that the salt of iron afforded by the nail is offensive to the worm, whilst it is harmless, or perhaps even beneficial to the tree.

A chemical writer upon this subject, says: "The oxydation or rusting of the iron by the sap evolves ammonia, which, as the sap rises, will of course impregnate every part of the foliage, and prove too severe a dose for the delicate palate of intruding insects." This writer recommends driving half a dozen nails into the trunk. Several experiments of this kind have resulted successfully.

### POTTING STRAWBERSIES.

Mr. Rivers, in London, raises strawberries in pots by a peculiar process, thus desribed:

About the second week in July, he says, he filled a number of six inch pots with a compost of two-thirds loam, and one-third rotten dung, as follows: three stout pieces of broken pots were placed in the bottom, and a full handful of the compost put in; a stout wooden pestle was then used with all the force of a man's arm to pound it, and then another handful and a pounding, and another, till the pot was brimfull, and the compressed mould as hard as a barn floor. The pots were then taken to the strawberry-bed, and a runner placed in the center of each, with a small stone to keep it steady. They were watered in dry weather and have had no other care or culture. For two or three years, I have had the very finest crops, from plants after this method, and those under notice promise well. If the pots are lifted, it will be apparent that a large quantity of food is in a small space. I may add that from some recent experiments with compressed earth to potted fruit trees I have a high opinion of its effect, and I fully believe that we have yet much to learn on the subject.

# Domestic Economy.

### TO PREVENT MILK FROM SOURING.

A correspondent of the *Ohio Farmer* gives the following plan:—Agreeable to your request I will give you an account of our experience in the dairy business, with regard to preserving milk from becoming sour. We have kept from fifty to a hundred and fifteen cows for several years, and have milked seventy-two the past season. We strain the milk at night into a tin vat set in a wooden one, into which we pump cold water for the purpose of cooling it. Thus it is kept sweet until morning, with very little trouble, when we strain in the morning's milk, which is warmed sufficiently by heating the water in the wooden vat. Thus we proceed until Saturday night, when the milk is set and the curd made which is kept until Monday morning and made into cheese. Sunday morning the milk is strained into wooden bowls, which are painted inside and out with a thick coat of paint, smooth and hard, and set in a cool place on the cellar bottom where it keeps sweet until Monday, when it is skimmed and made into cheese. The result has been that we have not lost a bowl of milk the past summer."

### TO PREPARE RENNETS.

When taken from the animal, empty and rinse them carefully in *pure* cold water, then fill them with salt, and pack them away in a close earthern jar—covering them with fine salt. When wanted for use, take two or three of them, and place them in an earthen vessel of the capacity of two gallons or more, and pour in sweet whey till it is full. Allow the rennets to remain submerged for two hours and a half, and the liquor will be fit for use. It must, however, be kept *very* salt. As fast as the liquor is used out, its place should be supplied by sweet whey. After awhile the liquor will become so reduced as to require three times the quantity originally required to produce the desired effect. The old rennets should then be thrown away, and new ones placed in steep.—Francis Anne, *in Germantown Telegraph.*

To Preserve Strawberries.—Look over with care. Weigh a pound of sugar to each pound of fruit. Put a layer of fruit on the bottom of the preserving kettle, then a layer of sugar, and so on till all is in the pan. Boil them about fifteen minutes. Put them in bottles, hot, and seal them. Then put them in a box, and fill it in with dry sand. The flavor of the fruit is preserved more perfectly, by simply packing the fruit and sugar in alternate layers, and sealing the jar, without cooking, but the preserves do not look so well.

Saleratus is said to be injurious to the human system, and that it destroys thousands of children and some adults every year. In New Brunswick, contiguous to Maine, the physicians are wont to say that half the children are killed by the use of saleratus. The evil is fast spreading throughout the Union. Families of moderate size already use from ten to twenty-five pounds yearly.

# Mechanic Arts, &c.

### LIST OF PATENT CLAIMS

ISSUED FROM THE UNITED STATES PATENT OFFICE
For the week ending June 14, 1853.

Charles B. Fitch, of Galena, Ill., for Improvement in mode of Cutting Tenons.

Wm. G. Huyett, of Williamsburg, Pa., for Improvement in Harvesters of Grain and Grass.

Sherman S. Jewett and Francis H. Root, of Buffalo, N. Y., for Improvement in Stoves. Antedated Dec. 14, 1852.

Harvey Murch, of Lebanon, N. H., for Improvement in Mop Heads.

Geo. F. Muntz, Jr., of Birmingham, England, for Improvement in the Manufacture of Metal Tubes. Patented in England, May 8, 1852.

Lea Persey, of Patterson, Pa., for Improvement in Self-waiting Dinner Tables.

Fergus Purden, of Baltimore, Md., for Improvement in Mortising Machines.

Alexander A. Sampson, of New Orleans, La., for Improvement in Brick Machines.

E. H. Smith, of New York, N. Y., for Improvement in Copying Presses.

John H. Sturgis, of New York, N. Y., for an Improvement in Type-casting Machines.

Giles F. Filley, of St. Louis, Mo., for Improvement in Cooking Stoves.

Jas. M. Brookfield and Ephraim V. White, of Honesdale, Pa., (and Jacob Faatz, having been decided to be a joint inventor with said White,) the said Faatz and White, assignors to Andrew K. Hay and James M. Brookfield, for Improvement in Manufacturing Glass.

John L. Kingsley, of New York, N. Y., for Improvement in Moulding Gutta Percha Stereotype Plates.

John J. Greenough, of Boston, Mass., for Improvement in the Manufacture of Plate Glass.

RE-ISSUE.

Patrick S. Delvan, of Reading, Pa., for Improved Lubricating Compound. Patented Jan. 16, 1849.

James A. Bowie and Charles Carr, of Philadelphia, Pa., assignees of Robt. B. Goodyear, of same place, for Improvement in Apparatus for Operating Shuttle-boxes of Looms. Patented March 13, 1849. Ante-dated Sept. 13, 1849.

### THE FRESNEL LIGHTS.

In a recent letter from Europe, Mr. Bryant says:

I have just returned from a visit to one of the government offices, in which the Fresnel lights, designed for the light-houses on the French coast, are deposited. The invention of Fresnel is one of the most beautiful examples we have of that skill by which the apparently barren phenomena of science are forced into the service of man.

Light, you know, radiates in all directions. Place a lamp in a tower on a sea-coast, and a part of its rays are wasted on the clouds above it, part on the earth below, and part streams to the right and left where they are not wanted. By a most ingenious arrangement of prisms, Fresnel collected these useless rays and sent them forward in a horizontal direction, parallel with the surface of the ocean, where they must meet the eye of the mariner. An intense light, by this concentration of its beams, is obtained from a single lamp. I desired to see an example of the effect produced, and a lamp was placed within one of Fresnel's circles of prisms, while I stood at the distance of twenty feet or more. It blazed into my eyes like the rising sun, and I could not bear to look at it.

Lieutenant Bartlott, of the United States Navy, is now in Paris, superintending the purchase of two or three of these lights, for which appropriations have fortunately been obtained from Congress. One of them is shortly to be sent out to America, and will, it is expected, be exhibited for a time at the Crystal Palace. I hope it will be so placed that everybody may see it without cost; for I regard it as a matter of great importance that the perfect manner in which the invention fulfils its purpose should be generally known and acknowledged. The want of good lights on our coast is a scandal to our country. France, with a much smaller marine commerce than ours, has erected Fresnel lights at every part of her borders on the Atlantic and the Mediterranean, where the seaman needs the least notice of danger. These strong rays, piercing the fogs and storms, give the necessary warning in any state of the weather. England, with a commerce but little larger than our own, has also adopted the Fresnel lights. We, on the other hand, content ourselves with putting up a few lamps which glimmer feebly when the air is clear, and are of no use in thick and foggy weather, that is to say, when the light is wanted. We might nearly as well let our light-houses fall to ruin, and imitate the example of Turkey, which leaves its whole coast in entire darkness.

One or two of the French lights have already been set up in America, but they are of the original early pattern—before Fresnel and his brother had perfected the invention. I saw one of these at the repository of which I am speaking, and the difference between it and those which are at present used in France, is very great. In that model, Fresnel employed only prisms with straight sides; he had no apparatus for making any other; they were put together in small pieces; the light was obstructed by the cement used to confine them in their places, and the stray beams of light which escaped through the space between the prisms, were caught upon mirrors and reflected in the desired direction. But, in the new Fresnel lights, the mirrors are laid aside as no longer necessary; the prisms have taken a curved shape; they are larger and less numerous, and the sphere of glass which they form, enclosing the lamp, is of a far simpler and more solid construction, and a more perfect transparancy.

I was taken afterwards to the work-shop where these prisms are made, and whence the western coast of Europe is supplied with the apparatus for its light-houses.—Here large wheel-shaped masses of glass, fixed upon tables revolving horizontally, were ground with sand to the proper angle, and then finally polished. In another part of the building artisans were at work framing the turrets of metal and glass, in which the apparatus of Fresnel is enclosed. These are roofed with copper, and the iron ribs in which the glass is set are covered on the outside with thin copper bars, so that no part of the iron is in danger of corrosion by being exposed to the external air.

The great advantage of Fresnel's apparatus lies in the strength of the light which it throws in the direction where it is wanted, but it has two other important recommendations—its economy and the ease with which it is kept in order. With a single lamp it does what in the old method required thirty, and it dispenses altogether with the clumsy contrivance of reflectors, which are constantly becoming tarnished and wearing out. The supply of oil which is needed is, of course, comparatively trifling. I hope, for my part, that no time will be lost in lighting the whole coast of the United States, through all its degrees of latitude, on both sides of the Atlantic and Pacific, with the apparatus of Fresnel. The outlay at first would be considerable, but it would be soon made up to the treasury in the diminished expense of maintaining the lights. A liberal appropriation for the purpose made at once, would be an act of the highest frugality for the public treasury, to say nothing of the lives it might preserve, and the cargoes it might save from wreck.

I have been told that Captain Forbes, of Boston, not long since took out with him to America, two ship-lanterns constructed on Fresnel's plan. They were found to answer their purpose admirably, as I hear, but the Yankees, with their usual dexterity in applying such resources as they have at hand, immediately hit upon a substitute for Fresnel's prisms, of cut-glass, which is a great deal cheaper and succeeds almost equally well. They form the glass into prisms, with the necessary curve, by pressure, and in this way construct a lantern but very little inferior in the strength of its light to those made in the French way.

### TO LIGHT GAS WITH YOUR FINGER.

The Philadelphia Ledger suggests another way of lighting gas by electricity, in addition to that before mentioned.

The gas can be lighted, says that paper, by frictional electricity, excited by a lady's ordinary fur muff. Thus, place four tumblers upside down upon the floor or carpet, and upon these lay a board, or other substance to stand upon, within reach of the burner. Upon this insulated board let a person stand, and the second person take the muff and rub it a number of times down the back of the coat of the first, by which he or she (if it be a lady with a woolen shawl on,) will become charged with electricity sufficiently to light the gas with the tip of a finger as effectually as if done with an ignited match. To perform the experiment well requires three persons, one to turn on and off the gas, for if done by the person insulated and charged, he will not only catch a shock, but discharge the electricity before applying it to the gas. A number of persons can participate in the amusement at the same time, by insulating themselves and joining hands. Let the friction of the muff be applied to the person furthest from the burner, until all become charged, and the person at the other extreme can light the gas, all feeling a sensible shock at the time of ignition or discharge of the fluid.

### NEW INVENTION FOR BLASTING ROCKS.

A correspondent well qualified to judge of such matters, sends us an account of a new invention for blasting rocks. He writes, after an examination of the process:—"The apparatus is the invention of Mr. A. Stickney, of Norwich, Vermont. It is a platinum tube about ten inches in length, with holes in its side. Connected with this is an iron tube of any required length.—This is the apparatus now in operation. A hole is drilled in the rock to any depth; this tube is filled with charcoal, and ignited in the platinum, and inserted in the drill hole. A blacksmith's bellows is applied to the upper end of the tube, and the most intense heat is forced through the small holes upon the sides of the rock, scaling it off in fine powder at a rapid rate. When the heat is sufficient, the tube is withdrawn, and water poured in, which enlarges the hole at the bottom. The effect of powder upon a rock when confined in such a way must be tremendous. The experiment has been tried with the most perfect success.—*Boston Transcript.*

If you wish to drive a cut nail into seasoned oak timber, and not have it break or bend, just have a small quantity of oil near by and dip the nail before driving, and it will never fail to go. In mending carts and plows, this is of great advantage, for they are generally made mostly of oak wood.—In straightening old nails before using, let it be done on wood and with easy blows.

That faculty of the mind which men call Reason is not able to make us *do* what it *forces us to approve.*

It is better to sit down with honor, than to attend the changes of an inconsistant fortune.

# Educational.

## THE PEOPLE'S COLLEGE.

It may not be generally known to the readers of the RURAL, that an Act was passed at the last session of the Legislature of this State, incorporating an institution by the above name. The trustees named in the Act have had a meeting and organized, and nothing now remains but to raise the funds, to go on with the project.

As this is to be emphatically the People's College, it has got to depend in a great degree upon the farmers and mechanics for its endowment. It is for their benefit, and they must put their shoulders to the wheel and set it in motion. We want $50,000 at once, before any thing can be done towards locating; and we must have it too. The shares are at one dollar. Let, therefore, every man, woman and child subscribe.—And let us show to the world that the Farmers and Mechanics of this State are not only able, but willing to endow a College, as no other institution has ever been endowed.

It is proposed to make this an institution where every one who desires it, can obtain an education, however humble their means, and at the same time fit themselves for some mechanical business, that will insure them employment the moment they leave the College. All the means will be furnished that can be found at any other College, for a thorough and finished collegiate education, while at the same time the body and hands will be educated as well as the mind. For instance there will be a shop for the manufacture of steam engines, and at the head of it will be a man thoroughly versed in every thing pertaining to that very important motive power. There will be a railway and a model locomotive upon it, and every thing relative to running railways will be on the grounds. A student is required to labor a certain number of hours, and wishing to become an engine driver, he is permitted to go into the shop, and to become thoroughly acquainted with the whole subject of the steam engine, by actual labor upon its various parts. Nor will he be permitted to receive a diploma until he has thoroughly mastered the subject. He will be required to be able to take any part of a locomotive or other engine, assign its place and tell its use, and the reason for its occupying its appointed position. He will be required to know how much pressure can be carried with safety, at what point there is danger, and how to obviate it; in fine, he must know all that is known, and can be taught. While he is obtaining this knowledge, he is also obtaining a thorough education in the other and usual branches taught at Colleges, and in such a course as his time will permit him to master. For the student can, at entering, select his studies, or the course he wishes to take, but he will be required to master it.

Suppose the student to have properly graduated, and received his diploma as master of the art of steam engineering. That diploma is a fortune to him, and he need not be twenty-four hours out of employment. Such young men would be sought with avidity by all the first class railroads, and steamers, and their fortunes are made at once. What is true in regard to the steam engine, will be also true in regard to all the other leading branches of mechanical skill, as well as to Farming and Gardening, and Horticulture. Equal facilities will be given to girls for a useful and cheap education, if required.

Do you not see then, fathers and mothers, that, however humble your position, here is a chance to give your children a good education? Boys, now is the time for you. Put in your mite, be it a month's or a week's wages, and get your parents to put in liberally to this great work. Girls, give us your help. If you cannot give us the dollars, you can give to the work your smiles and influence. Let us have this great and glorious institution in full operation within another year. We have only to will, and it's done.

Mr. H. HOWARD, of Lockport, is the general agent, and young gentlemen or ladies who are willing to canvass their town or county, can apply to him, and he will furnish them with instructions. Heaven prospor your efforts. T. C. PETERS.

NORMAL JUBILEE.—We learn from the New York Teacher, that the biennial gathering of the "Association of Normal Graduates" will be held at the Normal School building, Albany, on Wednesday, July 13. All the old teachers are expected and invited to be present, and the prospect is favorable for the attendance of most of the members of the Association. The business meeting will be held in the forenoon and the public exercises, consisting of poems, addresses, music, &c., will take place in the afternoon of the same day.

## LEARNING TOO SOON.

At sixteen, the girl's education is often considered finished. At the very age when, if a right system of physical and mental discipline had been pursued, she would have been prepared, with a strong mind in a strong body, to commence serious study, her education is pronounced finished, and she willingly lays aside her task to enter society more fully than was possible during the period of schooling. Henceforth, pleasure is the chief object—for the plans that, perhaps, were formed on leaving school, for reading and study, are never executed; the mind is not prepared to exert its power alone. The knowledge already acquired has no connection with her present life; her social nature needs companionship; and the temptations of society are too strong to be long resisted.

And what has been gained during those long years of school, at such a sacrifice of physical strength? The logic has not taught her to reason well on any subject; the mental and moral philosophy will furnish her no guide to goodness or happiness; the chemistry will never aid her in the preparation of wholesome food, or taking stains out of her furniture; the botany will not render more interesting the country rambles that she does not care to take.—She will never use her natural philosophy to make the fire burn, or ventilate her house. Those studies will be completely dropped and soon forgotten—for they were learned too soon; the mind could not retain them: they were acquired too superficially, too unpractically, to be of any use in strengthening the understanding or aiding in daily life.

The music may be useful in society, if there is any natural taste for it; if it is simply acquired with much drudgery, it will be at once dropped. The French will be of doubtful service; the young lady is too shy to speak it, if the occasion should present itself; if natural taste or circumstances induce her to persevere in its study it may prove an elegant accomplishment—but in general that, too, is dropped. What, then, is made serviceable out of the long list of studies? A little reading and writing (for it is very rare to find an elegant writer, still rare one who can read well aloud,) some arithmetic, and the general outlines of history and geography—this may be retained for life, and this is about all! Little real knowledge is gained but an evil habit of mind has been acquired;—a habit of careless, superficial thought, and inability to apply the mind closely to any subject; and this habit, unfortunately, cannot be dropped with the superficial acquirements which produced it. What a result is this for years of time spent and much money!—surely we may call it a criminal waste of life.

## COURTESY.—THINK OF THIS.

The power of diffusing happiness is not the exclusive power of the rich. All are capable of it. The poorest man can cheer me by his affection, or distress me by his hatred or contempt. Every may is dependent on another. A piece of neglect, even from the lowest and most contemptible of men, is fit to ruffle the serenity of my happiness; and a civil attention even from the humblest of our land, carries a gracious and exhilarating influence along with it.

Let me never hear, then, that the poor have nothing in their power. They have it in their power to give or withhold kind or obliging expressions. They have it in their power to give or withhold the smiles of affection and sincerity of tender attachment. Let not the humble offerings of poverty be disregarded. The man of sentiment knows how to value them; he prizes them as the best deeds of beneficence. They lighten the weary anxieties of this world, and carry him on with a cheerful heart to the end of the journey.

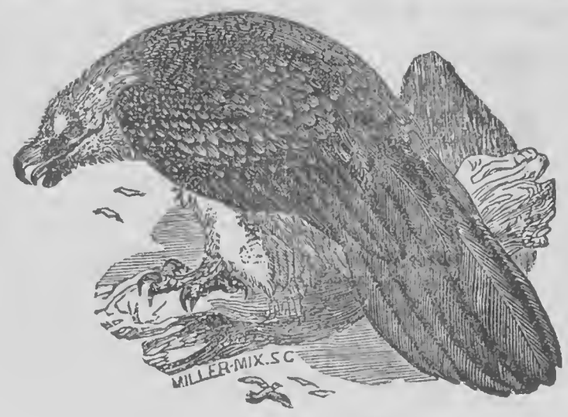
## NOTHING IS LOST.

The drop that mingles with the flood—the sand dropped on the sea shore—the word you have spoken, will not be lost.—Each will have its influence and be felt, till time shall be no more. Have you ever thought of the effect that might be produced by a single word? Drop it pleasantly among a group, and it will make a dozen happy, to return to their homes and produce the same effect on a hundred perhaps. A bad word may arouse the indignation of a whole neighborhood; it may spread like wild-fire, to produce disastrous effects. As no word is lost, be careful how you speak—speak right—speak kindly. The influence you may exert by a life of kindness—by words dropped among the young and the old—is incalculable: it will not cease when your bodies lie in the grave, but will be felt, wider and still wider as year after year passes away. Who then will not exert himself for the welfare of millions?

## A BUSINESS GIRL.

We are acquainted with a girl, says the accomplished editor of the Merchant's Ledger, who has the principal charge of a large mercantile establishment in a flourishing country town, who visits different cities alone, stops at hotels, purchases supplies of dry goods, hardware, china, groceries, shoes, nick-nacks and multifarious saleables, which make up "stock" in a miscellaneous store. She gives notes, make scontracts, and does all such business as belongs to her; and we have never yet learned that she has sacrificed one iota of the dignity, admiration and respect which are her just due, as a young, amiable, and very pretty woman.

THE elder brother "is one who made haste to come into the world to bring his parents the first news of male posterity, and is well rewarded for his tidings."—*Fuller.*



## THE LAMMERGEYER.

In its attitudes this bird resembles the eagles more than the vultures, its confident and sprightly bearing strongly contrasting with the crouching and suspicious postures of the latter. Like these, however, it generally retains its wings in a state of half expansion when at rest, and its neck more or less retracted within its shoulders. Its food, is more frequently sought in a living prey than on a putrefying carcass; and for this reason it is not often found, like the vultures, assembling in considerable troops.—The increased curvature of its talons also contributes to the same object, by enabling it to carry off its prey, whether living or dead. A careful comparison will show how nearly this bird holds the middle station between the two large groups to which it is almost equally related.

In size it is the largest of European birds of prey, measuring, when fully grown, upwards of four feet from beak to tail, and in the expanse of its wings no less than nine or ten. M. Fortis indeed asserts that he had seen an individual in Dalmatia, the expanded wings of which measured twelve feet.—The general color of the upper part of this remarkable bird is a dull brown with a mixture of gray; its wings and tail are of a grayish ash color; the upper part of its head is a dirty white; a black band extends backwards from the base of the beak across the eye, and joins a narrower stripe of the same that passes upwards to unite with its fellow on the back of the head; and the neck, breast, and under parts are white with a shade of reddish brown or orange, which is deeper on the breast and throat, and gradually becomes less distinct on the abdomen and legs.

In its habits this bird combines the audacity and cruelty of the eagles, with the appetite for carrion which distinguishes the vultures. It seizes by preference living victims, chiefly quadrupeds, and especially those which are incapable of making an effectual resistance, such as rabbits, hares, sheep and lambs, or even young goats and calves; and thus proves an extremely dangerous neighbor to the peaceful flocks which graze on the declivities of the mountains inhabited by it, or in the intervening valleys. Sometimes, when rendered desperate by a long fast, it is said to attack the chamois, or even man himself, choosing for the scene of its exploits the brink of a precipice, and descending upon its victim with such an irresistible impetus as to precipitate him headlong into the abyss below. But such bold attempts as this, although spoken of by many writers, are foreign to its usual habits, and may rather be regarded as traditions handed down from generation to generation, than as a common or every day occurrence. In the same manner it is probable that the stories current in the Alps, of children carried off by vultures to be devoured, are rather the expression of a natural dread of what might happen, than a relation of actual events. We are not aware of any authentic testimony in proof of the fact, which may therefore be classed with the narratives of the same description with reference to the condor.

It is from the character in which it is best known to them, as the spoiler of the fold, that this bird has received from the natives of the German Alps its title of Lammergeyer, the Lamb Vulture. But although this is its food of choice, it feeds also upon carrion; and as when in pursuit of a living prey, it emulates the eagles by soaring alone or in company only with its mate, so in its attack upon an unburied carcass it imitates the vultures by congregating in bands upon the spoil. In such circumstances it does not usually descend from aloft, but sweeps slowly along the ground towards its expected banquet. Bruce relates, in his Abyssinian Travels, a remarkable instance, illustrative at once of its boldness and voracity. His servants were preparing for dinner on the summit of a lofty mountain, when a bearded vulture, attracted by the smell of the goat's flesh, which they were cooking, slowly made his advances towards the party, and at length fairly seated himself within the ring which they had formed. The affrighted natives started up and ran for their lances and shields; and the bird, after an ineffectual attempt to extract a portion of their meat from the boiling water, seized a large piece in each of his talons from a platter that stood by, and carried it off slowly along the ground as he came.—After an interval of a few minutes, the vulture returned for a second freight, but was shot by the traveler before it could carry its purpose into effect. The manner of its flight in this instance, as well as in many others, may be taken as an indication that this species does not usually make its prey of birds, which it is rarely if ever known to attack.—*Library of Natural History.*

## THE GREAT GRAY OWL.

Two specimens of this magnificent bird, (*Syrnium cinereum,*) have, this season, been shot, within a few weeks of each other, at the Helderberg mountains, about 12 miles distant from our city, and are at the present time, beautifully preserved in the collection of James A. Hurst, the able Taxidermist to the State of New York. This fine grey owl is considered the largest species of the family to which it is attached, and has been chiefly confined in its wanderings to the Arctic regions of America; we therefore take great pleasure in connecting this interesting bird to the fauna of our State, as it has never before been positively determined to have had a residence within its limits.—They are generally to be found in pairs, and feed indiscriminately on mice, hares, and other similar animals, which they are known to seize with so much vigor, as sometimes to bury themselves a foot beneath the surface of the snows during the pursuit; they have also frequently been seen to bear off with ease, in their powerful claws, the large Alpine hare in a living condition.—*Country Gentleman.*

## ETHIOPIA.—THE HIPOPOTAMUS.

BAYARD TAYLOR, writing to the New York Tribune from Khartoum, the capital of Egyptian Soudan, describes his ride down the Nile. He says:

Here, where I expected to ride through a wilderness, I find a garden. Ethiopia might become in other hands the richest and most productive part of Africa. The people are industrious and peaceable, and deserve better masters. Their dread of the Turks is extreme, and so is their hatred. I stopped one evening at a village on the western bank. The sailors were sent to the houses to procure eggs and fowls, and after a time two men appeared, bringing, as they said, the only chicken in the place. They came up slowly, stooped and touched the ground, and then laid their hands on their heads, signifying that they were as dust before our feet. Achmet paid them the thirty paras they asked and when they found the supposed Turk had no disposition to cheat them, they went back and brought more fowls.—Travelers who go by land route, give the people an excellent character for hospitality. I have been informed that it is almost impossible to buy anything, even when double the value of the article is tendered; but by asking for it as a favor, they will cheerfully give you whatever they have.

On the third day I saw the first hippopotamus. The men discerned him about a quarter of a mile off as he came up to breathe, and called my attention to him.—Our vessel was run toward him, and the sailors shouted to draw his attention, "How is your wife, old boy?" "Is your son married yet?" and other exclamations. They insisted on it that his curiosity would be excited by this means, and he would allow us to approach. I saw him at last within a hundred yards, but only the enormous head, which was more than three feet across the ears. He raised it with a tremendous snort opening his mouth at the same time, and a more frightful monster I never saw. He came up in our wake after we had passed, and followed us for some time. Directly afterwards we espied five crocodiles on a sand bank. One of them was a grayish color, and upwards of twenty five feet in length. We approached quietly to within a few yards of them, when my men raised their poles and shouted. The beasts started from their sleep and dashed quickly into the water, the big yellow one striking so violently against the hull that I am sure he went off with a headache.

## A RAP AT THE RAPPERS.

A LONG article in Blackwood, for May, upon "Spiritual Manifestations," thus humorously and caustically closes:

"Keep your mind easy, dear reader! You are not one whit more likely to be disturbed by ghosts than your fathers or grand-fathers were, and you may set them thoroughly at defiance. Comfort yourself well, and you may be assured that neither your shaving brush nor razor will spontaneously smash the window—go to church regularly, and we give our guarantee against your being affixed to the ceiling. Be easy on the score of your furniture, until you observe it to be inconveniently locomotive, in which case, no doubt, you will be able to dispose of it to some Railroad company.—And above all things, despise humbugs, and do not follow in the wake of men who are called, or call themselves, philosophers. Many scientific men, in matters of reasoning, are asses; and it is a mercy that it is so, since, otherwise, through their crude conceits, they would destroy the equilibrium of the material world."

BEFORE the occurrence of an earthquake animals become uneasy. In that which took place in Calabria in 1783, it was noticed by Bartel that the sea fish were disturbed, and were taken in vast numbers; many birds fluttered about distressed in the air; dogs ran about howling; the horses and oxen trembled, pawing the ground and snorting as if in agony; and the cats slunk about with their hair bristled up.

## REFLECTIONS IN A CHURCH YARD.

BY J. D. KONKLE.

Beneath these turfs and hillocks green,
Oh! think what mouldering bodies lie,
Which once, like us, alive were seen,
To lightly laugh or sadly sigh.

How many here the dead among,
Have moved amid these silent tombs,
With rosy cheek and flippant tongue,
Unthoughtful of their certain doom.

But now promiscuous side by side
The gay, the grave, the vile and vain,
Lie still, and still they must abide,
As well the pious as profane.

Alike in dust they mingle here,
Greatness has now its power forgot,
The low no more the lordly fear,
Alike their lone, unchanging lot.

Enfield, Tompkins Co, N. Y., 1853.

## CONTENTMENT.

It happened once, in a hot summer's day, I was standing near a well, when a little bird flew down, seeking water. There was, indeed, a large trough near the well, but it was empty, and I grieved for a moment to think that the little creature must go away thirsty; but it settled upon the edge of the trough, bent its little head downwards, then raised it again, spread its wing and soared away singing; its thirst was appeased. I walked up to the trough, and there in the stone-work I saw a little hole about the size of a wren's egg. The water held there had been a source of revival and refreshment; it had found enough for the present and desired no more. This is contentment.

Again I stood by a lovely sweet-smelling flower, and there came a bee humming and sucking; and it chose the flower for its field of sweets. But the flower had no honey. This I knew, for it had no nectary. What, then, thought I, will the bee do? It came buzzing out of the cup to take a further flight; but as it came up it spied the stamens full of golden farina, good for making wax, and it rolled its little legs against them till they looked like yellow hose as the bee-keepers say; and then, thus heavily laden, flew away home. Then I said, "Thou camest seeking honey, and finding none hast been satisfied with wax and hath stored it for thy house that thy labor might not be in vain. Thou likewise shall be to me a lesson of contentment."

The night is far spent—the dark night of trouble—that sometimes threatened to close around us, but the day is at hand, and even in the night there were stars, and I have looked on them, and been comforted; for as one set, I could always see another rise, and each was a lamp showing me somewhat of the depth of the riches both of the wisdom and the knowledge of God.—*Parable from the German.*

## BEAUTIFUL EXTRACT.

We find the following rare gem in a southern paper. It bears the appearance of an extract from some sermon, and is worthy of a careful and attentive perusal:

Have you made one happy heart to-day?" How calmly can you seek your pillow, how sweetly sleep. In all this world, there is nothing so sweet as giving comfort to the distressed, as getting a sun-ray into a gloomy heart. Children of to-morrow meet us wherever we turn. There is no moment that tears are not shed and sighs uttered.

Yet, how many of those sighs, those tears, are caused by our own thoughtlessness!—How many a daughter wrings the soul of a fond mother by acts of unkindness and ingratitude. How many husbands, by one little word, make a whole day of sad hours and unkind thoughts? How many wives, by angry recriminations, estrange and embitter loving hearts? How many brothers and sisters meet but to injure and vex each other, making wounds that no human heart can heal!

And if each one worked upon this maxim day by day—striving to make some heart happy—jealousy, revenge, madness, hate, with their kindred evil associates, would forever leave the earth. Our minds would be so occupied in the contemplation of adding to the pleasure of others, that there would be no room for the ugly fiends of discord.—Try it, discontented devotees of sorrow, self-caused, it will make that little part of the world in which you move, an Eden.

THE MEMORY OF THE DEAD.—It is an exquisite and beautiful thing in our nature, that when the heart is touched and softened by some tranquil happiness or affectionate feeling, the memory of the dead comes over it most powerfully and irresistibly. It would seem almost as though our better thoughts and sympathies were charms, in virtue of which the soul is enabled to hold some vague and mysterious intercourse with the spirits of those whom we loved in life. Alas! how often and how long may those patient angels hover around us, watching for the spell which is so seldom uttered and so soon forgotten!—*Dickens.*

THERE is something higher in politeness than Christian moralists have recognised.—In its best forms as a simple, out-going, all-pervading spirit, none but the truly religious man can show it. For it is the sacrifice of self in the little habitual matters of life—always the best test of our principles—together with a respect, unaffected for man, as our brother under the same grand destiny. In its lower and more common development in every-day life, we have very much to learn of the Europeans.

# Miscellaneous.

## MY MOTHER.

BY N. P. WILLIS.

My Mother's voice! How often creeps
Its cadence on my lonely hours,
Like healing on the wings of sleep,
Or dew on th' unconscious flowers.
I might forget her melting prayer,
While 'wildering pleasures madly fly;
But in the still, unbroken air,
Her gentle tones come stealing by;
And years of sin and manhood flee,
And leave me at my mother's knee.

I have been out at eventide,
Beneath a moon-lit sky of Spring,
When earth was garnished like a bride,
And night had on her silver wing;
When bursting buds and dewy grass,
And waters leaping to the light;
And all that makes the pulses pass
With wilder fleetness, thronged the night;
When all was beauty, then have I
With friends on whom my love is flung,
Like myrrh on winds of Araby,
Gazed up where evening's lamp is hung—

And when the beauteous spirit there
Flung over all its golden chain,
My mother's voice came on the air,
Like the light dropping of the rain;
And resting on some silver star,
The spirit of a bended knee,
I've poured a deep and fervent prayer,
That our eternity might be—
To rise in Heaven, like stars by night,
And tread a living path of light.

## A JOURNEY ACROSS THE PRAIRIES.

One who has never seen a Prairie, must necessarily form very inadequate, if not very erroneous, ideas concerning this remarkable phenomenon of the Western world. A vast extended plain, bounded on all sides by the blue sky, or at most, by a narrow horizontal line, or belt, of a darker blue, rising but little above the plain of the sensible horizon, indicating the distant range of woodlands which seem almost to diminish or recede as you approach them, is not all that is meant by a Prairie. Several other items must be taken into account, some of which may be understood by a perusal of the following thoughts, that involuntarily suggested themselves to the mind of the writer while crossing the Prarie (from Northville to Ottawa) that covers a large portion of the North part of Lasalle county, Illinois.

[This Prairie, like most others, is not entirely level, but presents here and there gentle swells, or risings, which in some places were sufficiently extensive and elevated to answer the purpose of sites for buildings. There are also many depressions, or basins, generally of small depth and extent, which in wet weather are filled with water, many of which can frequently be seen from the same point; the more distant exhibiting a mere line of water on the surface of the ground. These, communicating with each other, and their waters settling away into the lower parts of the Prairie, form what are called "sloughs," (here pronounced *sloos*,) which often increase to streams of considerable size.]

But that which appeared most singular to the writer, was, that in journeying across the Prairie in any direction, whether north, south, east, or west, we always appeared to be *ascending* a hill of very gentle elevation. This, I am informed, ceases to be the case when persons become familiar with Prairie traveling.

Another thing which I could not avoid noticing, was the *rounded appearance* of what is generally considered a plain. In every direction there was the appearance of looking *over a hill*. This was, perhaps, in part caused by the "curvature of the earth's surface," which is known to be about eight inches to a mile, and which becomes very manifest on a plain of several miles in extent.

Another phenomenon equally remarkable is, the deception in regard to distances. An object that appears to be distant perhaps two miles, is found to be more than twice that distance; and the traveler often becomes impatient, as he finds the object of his pursuit more remote at the end of a given time, than he supposed it to be at the beginning.

Another phenomenon equally observable, is, the Prairie wind. To one accustomed to an uneven, or hilly country, it may seem strange that the winds on the Prairies are often stronger, as well as more bleak and severe, than in a hill-country. Yet such is the fact; (at least so it appeared to me;) for meeting with nothing to intercept their progress, they often sweep the Prairie, as they lash the Ocean, with tremendous fury.

Further, standing alone in what appears to be an almost boundless expanse, without a single object of any kind near to break the monotony of the scene, the mind becomes sensibly oppressed with a sense of loneliness, or *desolateness*. Add to this the fact, that with nothing to divert time, the traveler is every moment in danger of losing the points of compass, (and most certainly does, if the day be cloudy, or the night dark,) and we can hardly conceive of a condition more sad and gloomy. Hence the idea of being overtaken by darkness or a storm, in such a place, is fearful in the extreme. There is nothing to which he can run for shelter, no place where he can hide from the peltings of the storm.

Again, the reflecting mind feels its littleness—its insignificance. In the presence of the mighty cataract, it is overwhelmed with a sense of majesty; while here, on the vast Prairie, it is almost swallowed up with a sense of infinity. There it is awed into silence by a display of power; here, by the idea of immensity.

Everything here becomes an object of interest. A solitary shrub, a stone, (some of these are sometimes found,) a bird, a reptile, or even a flower, acquires a degree of importance unperceived before; and the first impulse is to wonder, if not inquire, how it came here! H.

Out West, May, 1853.

## A MAINE LAW ARGUMENT.

A few years ago, says a correspondent of the National Intelligencer, I was in company with a gentleman who had just returned from the city of L., in New England.—He said he put up at a hotel, and for a time took his seat in the bar-room. The door opened suddenly, and a female stepped in. She was the very picture of agony—her hair dishevled, her dress negligent, her eye unsteady, and her movements eccentric.—She seemed to hesitate at first, but at length, gathering courage, she moved up to the bar, and said: "Landlord, don't sell my poor husband any more rum. You have already ruined us! You know that before he began to come to your bar, he was a sober man. He was as kind a husband as any woman ever had. We had a good home, a good farm, and every comfort. But you sold him liquor until he had no more money to pay. Unbeknown to me, you got a mortgage on his farm; you sold it, and turned me and my helpless children out of doors! My husband has lost his health, his character, and his reputation. He became cross and abusive to me, whom he once tenderly loved. He turns me out of our wretched hovel into the cold and the storm! He comes home from your tavern infuriated like a demon. My once kind and amiable husband and the tender father is a madman when he is in liquor. He beats me and my children cruelly, and threatens to murder us! Oh! don't give him any more liquor!" and the tears gushed from her eyes, while the landlord stood speechless.

In the midst of these entreaties, which should have broken a heart of adamant, a man stepped into the bar-room, and, with the vacant stare of an inebriate, moved toward the bar. Instantly the pleading wife threw herself between the man and the bar, and, with one hand against his breast, and the other stretched out imploringly to the landlord, she said, "Oh don't! my dear! don't drink! You'll break my heart;" and bursting with agony, she turned to the landlord, and said, "Oh, don't let him have it! don't! don't!" And while this scene was passing, heart-rending and awful beyond the power of description, the landlord walked out from behind the counter, and taking the woman rudely by the arm, said, "This is no place for women;" and violently tore her from her husband, and, pushing her out, shut the door against her. He then went behind the counter, and placed a bottle of liquor upon it. The wretched inebriate staggered up and drank his dram, placed a piece of money upon the counter, the landlord wiped it off complacently into the drawer, and the drunkard passed out, maddened with the draught, to renew his brutal attacks upon his defenceless wife and children.

Nobody defends such barbarous cruelty as this. No one apologizes for it. All agree to pronounce the landlord a brute. But there was one fact deserving special attention. The whole transaction was under sanction of law! For the sale of every glass of that ruinous liquor, which reduced an honest man and a good citizen to the lowest degree of suffering and infamy, he could show a "*license*" from the officers of justice, under authority solemnly convoyed by grave senators and assemblymen, signed by the Governor and bearing the seal of the State!

There was no redress in law for this suffering lady. She had been robbed of her home, of her comfort, of her husband, and the blight of despair had been thrown over her whole family; but the law protected the destroyer, and left her to endure her anguish without the hope of relief!

The people of that State have changed the law on that subject since; so that the rum-seller cannot take away the home of the helpless, and ruin a man with impunity. *Have they done right?*

## THE AUTHOR OF "SWEET HOME."

As I sit in my garret here (in Washington,) watching the course of great men and the destiny of party, I meet often with strange contradictions in this eventful life. The most remarkable was that of J. Howard Payne, author of "Sweet Home!" I know him personally. He occupied the rooms under me for some time, and his conversation was so captivating that I often spent whole days in his apartment. He was an applicant for office at the time—Consul at Tunis—from which he had been removed. What a sad thing it was to see the poet subjected to all the humiliation of office-seeking. Of an evening we would walk along the streets, looking into the lighted parlors as we passed. Once in a while we would see some family circle so happy, and forming so beautiful a group that we would both stop, and then pass silently on. On such occasions he would give me a history of his wanderings—his trials, and all the cares incident to his sensitive nature and poverty. "How often," said he once, "I have been in the heart of Paris, Berlin, and London, or some other city, and heard persons singing, or the hand-organ playing "Sweet Home," without a shilling to buy the next meal, or a place to put my head. The world has literally sung my song until every heart is familiar with its melody. Yet, I have been a wanderer from my boyhood.—My country has turned me ruthlessly from my office; and in my old age I have to submit to humiliation for bread." Thus he would complain of his hapless lot. His only wish was to die in a foreign land, to be buried by strangers, and sleep in obscurity.

I met him one day looking unusually sad. "Have you got your Consulate?" said I.

"Yes, and leave in a week for Tunis; I shall never return."

The last expression was not a political faith. Far from it. Poor Payne; his wish was realized; he died at Tunis. Whether his remains have been brought to his country, I know not. They should be, and if none others would do it, let the homeless throughout the world give a penny for a monument to Payne. I know him, and will give my penny, and for an inscription the following:

HERE LIES
J. HOWARD PAYNE,
*The Author of "Sweet Home."*
A wanderer in life; he whose songs were
sung in every tongue, and found
an echo in every heart,
NEVER HAD A HOME.
HE DIED
*IN A FOREIGN LAND!*

## REMARKABLE PHYSICAL PHENOMENON.

A SLEEPING GIANT—A RIP VAN WINKLE.

Our attention was called yesterday to a most extraordinary phenomenon. A full grown man, six feet and two inches tall, 37 years of age, has slept for nearly five years, with only occasional and brief intervals of wakefulness. The name of this man, subject to so remarkable a suspension of the ordinary faculties of the race, is Cornelius Broomer. He is the son of a farmer living in the town of Clarkson, in this county, in whose family only this singular instance of prolonged somnolency has ever occurred. The subject of our notice first fell into this long sleep on the 19th June, 1848, and since that time has been awake at different periods, from a few hours to four months at a time. It is remarked that when he comes out of this catalepsy, he appears to have no knowledge of the lapse of time, or circumstances taking place while he sleeps. The fit comes upon him instantly, without, so far as is known, any warning. His eyes close, his jaws are set, his muscles contract, and his whole form is rigid, so that if he is standing, he continues in that position partly bent over; and it is not easy to pull him down. He has continued in this condition for months together, unable to speak or move.

Various experiments have been tried to restore him to consciousness, but without effect. A seton has been inserted in the back of his neck, without producing any apparent effect, and on one occasion cayenne pepper, moistened with spirits of turpentine, was put into his mouth, and no visible emotion was caused by the caustic dose. Physicians have seen and wondered, theorized and experimented in vain. The man sleeps on, lives, eats, retains perfect health, with a pulse at 80, and without variation. When asleep, he may be placed upon his feet, and he will stand for days together, as he has been known to do for three days and nights in succession. In order to feed him, it is necessary to pry open his firmly set jaws; and in this manner, but little food is introduced into his stomach. He is not, however, much emaciated, keeps his natural color, and appears entirely without disease, excepting that which produces his strange sleep. When he awakes, he comes out of his trance suddenly, his rigid muscles relax at once, he asks for meat or drink, and falls to voraciously. If asked why he sleeps so much, he appears to regard it as an imposition, just as an active man would receive an intimation that he was considered sluggish.

The last time he was awake was about five or six weeks since. He was left nearly alone at home; and on coming out of sleep, he got up and went to the lake shore where his brothers were; going into a grocery, he called for liquor, and asked the company to drink with him. On such occasions he is not violent or angry; appears strong and in the full possession of his mental faculties. A slight indication that he is not entirely unaware of what is transpiring about him, was given recently, by his asking his father if he intended to allow him to be taken to New York? Several parties had been endeavoring to get permission to exhibit him, and he appears to have become aware of it by some means; perhaps by hearing conversation about him. This was the only instance of the kind, we believe. The fact that the eye-lids are in a constant tremor, favors the idea of his semi-consciousness.

This man is now in charge of Mr. Gardner Davis, of Brockport, who intends to exhibit him to the public, so that a thing so wonderful may be seen by all the world. A brother of the remarkable somnambulist accompanies him—a healty, strong man, six feet and two inches tall. Many of our Physicians have visited the man, at the place where he is lodged,—Mr. Demarest's Commercial Hotel, Front street. Efforts have been made to waken him, recently, so that the Faculty, who are deeply interested in the matter, may see him in his waken mood. It is a little singular that whiskey will have the desired effect, if it is possible to get enough down his throat. But he resists the introduction of the liquor, and it is very difficult to get it down in any quantity.

# For the Ladies.

Written for the Rural New-Yorker.

## LITTLE COUSIN CLARA.

BY M. AUGUSTA BRAINARD.

What a lovely little Fairy,
Art thou, gentle cousin Clara!
With thy ways so mild and winning,
Sure, thou never thought'st of sinning!
Blue as violets in the meadow,
Is thine eye beneath the shadow
Of the lids so gently sleeping,
Watch above them ever keeping,
Ever changing their expression,
Beaming now Love's sweet confession,
Trembling then, in childish sorrow,
Followed by the smiles that borrow
Half the beauty they inherit,
From thy sinless child-like spirit.

Well thy mother loves the twining
Of thy hair so soft and shining,
Parted smoothly from thy temples,
Or in curls concealing dimples
That in either cheek are hiding,
When she gives thee gentle chiding.
Little mouth so "wee" and bonnie,
Sweet its kiss as golden honey;
Lips as red as bursting cherry,
Wearing smiles so arch and merry.
Blessings on thee, priceless treasure!
Spring of deepest, purest pleasure,
Promise, every sorrow cheering,
Rainbow, brightest tokens bearing.

E'er, as now, thou happy creature,
Health and joy deck every feature,
Purity make thee her dwelling,
Every ruder passion quelling;
Then with parents' fond caressing,
They will feel thou art the blessing
Dearest, from the Heavenly Giver
Whose protection's o'er us ever.
Short and fleeting be thy sorrow,
Grief, like night, soon fade to-morrow
When still brighter is the dawning,
From the clouds its bright forewarning.

Were it mine to give thee pleasures,
Mine to guard thy mother's treasure,
Sickness ne'er should fade the roses,
Which thy rounded cheek discloses;
Care should pass thee bright and youthful
And thy spirit free and truthful,
Few the trials that surround thee,
Many, dear, the friends around thee;
Truth, the angel of thy bosom,
Love, its purest, earthly blossom,
Innocence, thy footsteps guiding
Ever smooth thy days be gliding,
To those scenes so bright and vernal
In the beauteous land eternal.

Poolville, N. Y., 1853.

## THE OLD LETTER-BOX.

BY A FARMER'S WIFE.

Did any of the readers of the "Rural" ever encounter a *May-day* as connected with the custom "more honored in the breach than the observance," of pulling up stakes and removing to a new residence?—the time that tries all the domestic virtues of a house-keeper, the time when long-lost things are brought to light, and many more are forever lost. The season for a general overhauling and setting in order of chests, trunks, drawers, bundles, bags, and last comes the old Letter-Box—the contents of which are to be sorted over, and the least valued to be consigned to the kindling-basket, to make room for more; a part, still precious for sake of old associations, are to be preserved a little longer.

Ah! here is a bundle too precious to consign to the flames. They were written many years ago, during a separation of young hearts that were sanguine of a happy future, quite sure that *they*, at least, should escape the rocks and shoals in the sea of matrimony, where so many barks, deep-freighted with heart treasures, had been so fatally wrecked. Though the writers have often sat in the shadow of "Adversity's dark wing," they have ever retained a confidence in each other that has blunted its arrows so that none have pierced their souls. At the bottom of a letter written a short time previous to their marriage, I find the following, written by the same hand nearly twenty-five years later:

Though silver threads bedeck my brow,
And youth hath *lang syne* fled,
My heart beats warmly for thee now,
As when we first were wed.

But let us lay these aside, and explore still further.

Here is a confidential letter from one of the sterner sex, who had been unsuccessful in his efforts to gain the affections of my friend J. He loved with all the enthusiasm of a Klopstock; like him he thought his bleeding heart could never heal, and like him, too, at length found another Meta that eclipsed the first. Such are young men's hearts, and seldom are they broken by one failure.

Here is another letter, that calls up so many emotions and recollections that I must linger awhile over its contents; it is from a pure-hearted country girl, who had been superseded in the affections of a student, whom she had been attached to from childhood, and to whom she was engaged to be married. The young lady who stepped between her and the object of her attachment, was one whom nature had endowed with personal attractions, and a gifted mind, cultivated in the best schools of the times—in short, one every way qualified to captivate the heart of a devoted student. This letter, it will be seen, was written the day before James Warner's marriage:

"Yes, my dear friend, the die is cast, and he by whose side I expected to stand and take upon myself the solemn responsibilities of a wife, is to be married to Jenny Carlton. I do not blame James for loving her, for she is beautiful and learned;—he has a profession, and perhaps thinks he ought to have a wife to preside at his fireside who is more beautiful and accomplished than your very plain friend, Susan. Jenny possesses superior attractions, but my mother has always taught me that genteel accomplishments alone, will not make a family comfortable—that a wife, no matter how intellectual she may be, should possess a tolerable knowledge of house-keeping, in order to make her husband and family happy. Of domestic affairs Jen y knows nothing;—with the habits James has formed in his mother's well-ordered home, I fear for his happiness. Do not think, dear M., that, keenly as I feel this crushing of long-cherished hopes and expectations, I shall sit down supinely and grieve over my heart's sorrow. No—I still have duties to perform, and must seek in employment of mind and hands, a balm for the wound that I feel must be long in healing. Pray excuse my selfishness in troubling you with my griefs, but I feel to-day as though I must seek sympathy, for I know not how to bear my sorrows alone,"

And nobly did she bear her sorrows.—She did not sit down and repine, but determined to live a life of usefulness. Some friends urged her to prosecute the recreant lover for a "breach of promise." Such an idea she indignantly repelled.

Of all the social sins of which young men are guilty, it has always appeared to me there is none for which they are surer to meet with a speedy retribution, than that of trifling with the holiest affections of a trusting heart. When a young man has, by kindness and assiduity, secured to himself such a treasure, let him be careful how he casts it lightly from him, lest he plant thorns in his pillow that will pierce his temples, when whitened locks warn him that his lamp of life will soon go out, and he would fain look back on the past without remorse.

The subsequent life of James Warner fully illustrates this idea. I will, therefore, for awhile lay aside the Letter-Box, and relate some incidents that may serve to impress on young minds the importance of a faithful adherence to plighted vows. Unromantic as is his story, I think you will find in it one more example of the truth, "He that soweth the wind, will reap the whirlwind."

## FEMALE DELICACY.

Above other features which adorn the female character, delicacy stands foremost within the province of good taste. Not that delicacy which is perpetually in quest of something to be ashamed of, which makes merit of a blush, and simpers at the false construction its own ingenuity has put upon an innocent remark: this spurious kind of delicacy is as far removed from good taste as from good feeling and good sense; but the high-minded delicacy which maintains its pure and undeviating walk alike amongst women as in the society of men—which shrinks from no necessary duty, and can speak, when required, with seriousness and kindness of things at which it would be ashamed to smile or blush—that delicacy which knows how to confer a benefit without wounding the feelings of another, and which understands also how and when to receive one—that delicacy which can give alms without assumption, and which pains not the most susceptible being in creation.

## A PARAGRAPH FOR THE LADIES.

Female education now-a-days, often fails the mark, and *Misses* are so both in name and nature. Hear what a Connecticut contemporary has to say:

"Is housekeeping an essential part of female education? Undoubtedly it is. For a young woman in any situation of life to be ignorant of the various business that belongs to good housekeeping, is as great a deficiency as not to understand accounts, or for the masters of a vessel not to be acquainted with navigation. If a woman does not know how the various work of a house should be done, she might as well know nothing, for that is her express vocation; and it matters not how much learning, or how many accomplishments she may have, if she is wanting in that which is to fit her peculiar calling."

Marriage.—When youth weds youth for love, it is beautiful; when youth weds age for money, it is monstrous, and only hate, misery and criminality can come from it.—Of those "thrice sodden fools" who marry their grandfathers and grandmothers, old Thomas Fuller says with equal truth and wit—"They that marry ancient people merely in expectation to bury them, hang themselves in hopes some one may come and cut the halter."

It is a miserable state of mind to have few things to desire, and many things to fear.

MOORE'S RURAL NEW-YORKER

ROCHESTER, JUNE 25, 1853.

PUBLISHER'S NOTICES.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW-YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ ADVERTISEMENTS must be brief, appropriate to the objects of the paper, and accompanied with the cash.

### A New Half Volume.

A NEW half volume of the RURAL NEW-YORKER will be commenced next week. Those whose subscriptions expire with our present number, are reminded of our terms and rules—that we require advance payment, and discontinue the paper in all cases at the end of the term paid for. An invitation to continue the RURAL—and we trust all interested will extend such—will be cheerfully accepted, and meet prompt attention.

The present is a favorable time to subscribe for either six months or a year. The paper will be furnished six months to single subscribers or clubs, at the same proportional rates as for the full year. We shall add to our present edition, in order to furnish new subscribers for some weeks from the commencement of the new half volume. Agents, and friendly readers all, will please bear this in mind—remembering that they can materially aid in extending the circulation of the RURAL, by exhibiting specimens, and "a word fitly spoken." Will our readers do us and their well-to-do (as well as newspaper-borrowing) neighbors, the favor to act in accordance with this suggestion?

### Ruralizing in Southern New York.

RURAL READERS, you have abundant cause for thankfulness, that during all these hot summer days you are not pent up among the heated walls and cheerless pavements of a crowded, dusty city, but can snuff the pure air of heaven as it passes hill and dale, perfumed with the odor of the flowers of a thousand hills, and lave your fevered brow and weary frame in the pure and limpid water of some tiny lake, babbling brook, or deep flowing river. All these are rural delights, the enjoyment of which you may well be envied, for they are the sure sources of health, virtue and happiness.

Early last week we hied us out into the country, with "Express" speed—stopping to enjoy the beauties of Clifton Springs, and the luxurious hospitality of our friend PARKE, and then hastening on through the length of Yates county, one of the finest and richest in all this Empire State, dotted with villages whereof Penn Yan is chief, and interspersed with well cultivated farms, the superior of which is hard to be found. We enjoyed the beautiful landscape around Seneca Lake, and the hill-bound valley on the route from the head of the Lake to the enterprising village of Elmira.

Of villages we desire not now to speak. Ours has been a ramble in the country,—viewing the rich valleys of the Chemung, Tioga, Susquehanna and the Chenango rivers,—enjoying the refreshing breeze from those bright, green hills, and communing with Nature in her lovely and majestic moods. The hills and valleys of Old Steuben, though not among the richest in the world, are cultivated by the hands of skillful farmers, whose toil is rewarded by bountiful crops, and who enjoy as many of the rural joys and blessings as many who feel themselves more highly favored.

We have before had occasion to remark of the valleys of the Tioga and Chemung, as well as of the Susquehanna, and the beautiful country round about Athens, Penn., where the waters of the Susquehanna and Chemung, uniting, pass the villages of Sheshequin and Towanda, and pursue their steady way into the classic valley of Wyoming below. The North Branch Canal is nearly completed, opening a direct communication from Athens, which is four miles from the New York and Erie Railroad, to Philadelphia, and to the inexhaustable supplies of Anthracite coal, with which the Wyoming valley abounds. A private company are now constructing a Canal from Athens to Elmira, connecting the North Branch with the Chemung Canal at the latter place.—This Canal will be in readiness as early as the other Canal is completed, thus opening a communication to the rich coal fields of Penn., so that coal can be loaded directly from the mines and unloaded on the New York State Canals without breaking bulk. Hardly any section can be more benefited than Rochester and Western New York.

Every year shows improvement in that portion of Southern New York along and contiguous to the New York and Erie R. R. The completion of the Buffalo and New York City Road, connecting with the Erie at Hornellsville, has added more to the passenger business than any other branch, the trains coming from Buffalo conveying more passengers than any other train on the Road, not excepting the Cincinnati Express. The number of passengers on all the trains fall far short of those conveyed over the Central Road, and the effort to run trains from Buffalo or Dunkirk to New York without change of cars, and as one continuous train, has the effect to keep the whole line of the Road in uncertainty and confusion, causing vexatious delays. This must continue to be so until they have a double track the entire length of the Road.

The building of the Elmira and Williamsport Road is going on briskly. The distance is some seventy-five miles, and will connect the New York and Erie with the main central lines in the interior of Pa. It will prove an important auxiliary to the trade and business of Elmira, already becoming an important point in the Southern part of the State. Other and important improvements are projected, the most important of which is the Syracuse and Binghampton Road, which the contractors are pushing forward with much energy. The whole farming country keeps pace with the towns in improvement and business. Increased facilities for sending to market, have stimulated production until what has heretofore been considered a poor part of the State, bids fair to rival the most favored in the amount and value of its productions.

In all the valleys along the line of the Erie Road grain is grown to a great extent, and we noticed the wheat as looking very fine and promising, and the corn and other spring grains as much more advanced than with us. Much attention is given to the diary, more especially to making butter, in which the farmers of Broome, Tioga and Chemung are little if any behind those of Westchester or Orange counties. Of their butter making we have ample notes for future use.

The lumber interest of this section is immense. Thousands of loads find their way to New York by the Railroad, and a much larger amount goes down the Susquehanna in the shape of rafts and arks; while from Corning, Elmira, and the smaller villages in that section, lumber goes down Seneca Lake, and finds a market along the Erie Canal and at Albany and Troy. The immense resources of Southern New York have been but scantily developed, but that little is sufficient to insure for it, at no distant day, a rank equal to that of any other part of the State.

### The Weather, Crops, &c.

DURING the past week the weather has been unusually warm,—the thermometer marking over 90° in the shade on several days—and generally favorable for the growing crops. The wheat crop is being more or less injured by insects in this and other States, and may fall far short of former anticipations. An intelligent correspondent, writing from Wayne county, June 20th, speaks of the weevil in that section, and adds:—"I fear this insect is doing much more damage this than in any former season. The wheat crop looks very promising, but when you see the weevil as I have seen it, you will be ready to drop 50 per cent from your expecations."

We give a few paragraphs relative to the crops in other and distant sections:

INDIANA AND OHIO.—The Indiana State Sentinel says: "Wherever we have traveled in Indiana and Ohio, the prospect for the wheat crop is not favorable. It is everywhere more or less injured by the Hessian fly. The Mediterranean wheat has escaped with less injury. In some places we have seen whole fields that will not yield the seed. There is very little old wheat in the country, and the new will fall far below an average crop."

VIRGINIA.—The Richmond Enquirer, of the 17th, says: "Judging from the tone of our exchanges the prospect for the forthcoming wheat crop is less favorable than it was a few weeks ago. This is owing chiefly to the appearance of the fly and joint worm in various places, by which extensive injury is said to have been committed. In some of the Southern States the cotton and other crops have suffered from drouth."

CONNECTICUT.—The crops in this region are usuusually forward and promising. Corn never looked better. Many farmers are busy getting in their hay, even thus early in the season. Laborers are in great demand. Many of the apple trees in this county and, indeed, more or less throughout the State, are suffering from the ravages of the worm. —*New Haven Journal*.

MAINE.—The Portland Advertiser, of the 18th, says: "The crops in this State are now generally in a very flourishing condition, and afford bright hopes of plenty."

IN this vicinity the canker-worm is committing great ravages on the apple tree. Trees which a few weeks since were covered with blossoms, are now blasted, and have the appearance of having been partially burnt.—*Boston Traveler*.

WE have made diligent inquiries as to what are the prospects of the wheat crop in our vicinity, and find that while there are some fields, and even some considerable sections which are injured by the fly, the majority of the crop is very superior and large.—*Wheeling Gazette*.

THE grass and grain crops never looked finer in this State, New Hampshire, Connecticut, and doubtless all over New England, than at the present time.—*Boston Journal*, June 16.

THE Southern papers very generally complain of the backwardness of the cotton crops, owing to the unfavorable weather and drouth.

THE farmers in the vicinity of Louisville commenced cutting their wheat on Friday, the 10th inst. The grain is large and full, and of the finest quality.

AN EXHIBITION of Flowers, Strawberries, Cherries, &c., is open in Corinthian Hall, this (Tuesday) P. M., under the auspices of the Genesee Valley Horticultural Society. The display is very creditable,—but as this number of our paper was nearly ready for press before the exhibition opened we are unable to particularize. By the way, why did not the proper officer furnish a notice of the time of holding this show, for publication in the RURAL? We wish to ascertain, and so do other members of the Society.

LOCOMOTIVE EXPLOSION.—A locomotive exploded on the New York & Erie Railroad near Susquehana station on the 16 inst.—killing several persons and severely wounding others. The engine was engaged in pushing a heavy freight train up the grade, and had run almost half a mile when the dome of the boiler exploded. The persons killed and wounded were laborers on the double track, with their wives, who had been allowed by the engineer to ride on the engine, in violation of the express regulations of the road.

BLACKWOOD'S MAGAZINE, for June, contains a choice variety of original articles, among them a poem from BAYARD TAYLOR. New York: L. Scott & Co. DEWEY, agent.

## Correspondence.

### Notes from the Capital.

ALBANY, June 20, 1853.

EDS. RURAL:—The past week has been one of unusual activity and interest in the three Houses of the Legislature. (I presume that all know that the *Lobby* is called the third house.)

First in order and importance is the passage of the Resolutions to amend the Constitution, for the purpose of bringing the public works to a speedy completion. The Conference Committee, referred to in my last, agreed upon a plan which is supposed to combine the advantages of both of the previous propositions, without any of the objectional features of either. This conclusion seems to be warranted by the fact, that the Resolutions reported by the Committee were, with the exception of a single vote, (that of Mr. JONES, Senator from Orange Co.,) unanimously adopted by both Houses. The present condition of Canal matters, may be understood by the readers of the RURAL from the following items:

1. The Constitution adopted in 1846 prohibits the Legislature from borrowing money, (except in cases of invasion, and the like,) to exceed, in the aggregate, the sum of $1,000,000.

2. The same instrument sets apart the surplus revenues of the Canals as an especial fund for enlarging the Erie Canal, and completing the lateral Canals.

3. The increasing demands of commerce seem to require a more speedy completion of these great improvements, than could be effected by the gradual application of these surplus revenues.

4. In 1851, a law was passed *supposed* to meet these exigencies by anticipating the fund set apart by the Constitution, and thus by a loan based on said fund, to complete the Canals without violating the provisions of said Constitution.

5. After $1,500,000 had been borrowed by virtue of the law, and the the contracts for finishing the entire enlargement had been made, the law was declared to be *unconstitutional* by the highest judicial tribunal of the State, which at once stopped all proceedings, and rendered the whole contracts *null* and *void*.

6. The present Legislature, at an Extra Session, called by the Governor almost expressly to consider this great and important public measure, have unanimously recommended, by the adoption of these resolutions, that the Constitution should be amended so as not only to enable, but actually to *compel* the Legislature to borrow enough to pay the $1,500,000 received into the Treasury under the law of 1851, and a sum not to exceed $2,500,000 per annum for four years after the amendment takes effect, which is presumed to be sufficient to accomplish the desired object.

7. Before these Resolutions can become operative they must be re-passed by the next Legislature, and the proposed amendment must be voted on by the people at the next general election of 1854.

In this statement, I have endeavored to present the naked facts, uncolored by party prejudices or predilections. Should the amendment prevail, the work will undoubtedly be prosecuted with all prudent dispatch, and it is to be hoped that the Canals of this great State, which add so much to its wealth and influence, will cease to be political hobbies for any and all designing demagogues, whatever be their party or their pretensions.

The law for suppressing the traffic of intoxicating drinks, has passed the Senate, and is now pending in the Assembly. It contains a clause submitting it to the people for approval, and it is among the probabilities that it will pass into a law.

The Catholic bill has been farther discussed and amended, but its fate is yet uncertain.

The case of impeachment is absorbing much interest. Warm words are used on both sides. A resolution has been introduced, having in view the impeachment of other members of the Canal Board, but judging from the way political hucksters play around such questions generally, it is not to be presumed that any one will be impeached, even if there be plansible grounds for so doing. O, that the *People*, the SOVEREIGNS of our Republic, would decree that THERE SHALL BE HONESTY — *even in politics*.

Other matters are transpiring of more than ordinary interest, such as the commencement exercises of the higher institutions of learning, the trial of Hendrickson for the alleged murder of his wife, and the preparations for the anniversary of Independence,—but my time and space are exhausted. More anon. *OWE.*

### Letter from Yates County.

PENN YAN, June, 1853.

FRIEND MOORE:—In my last from Indiana I expected you would hear from me again in Ohio, but I passed through the State with such haste it was impossible for me to learn any thing very definite and interesting in regard to the crops, and agricultural matters. But from the general appearance of growing grain, I should think the yield of all kinds of produce would be great.—Wheat I noticed, looked remarkably well in the northern and central sections. Grass, the greatest product of Ohio, presented a luxuriant growth, and will be a heavy yield, the season being wet, and better adapted to its rapid growth than grain.

I passed through Oberlin, at which place is located the "Oberlin College," a flourishing institution, and noted for its long and permanently established influences in the education of its members. There are now over six hundred students, receiving their last Collegiate instructions at this institution. This is a fine town too, for the location of such an institution. It contains about two thousand inhabitants.

BROWN, of the "Ohio Farmer," is laboring for the good of the agricultural community of the State very zealously, and the missions of his paper, I should judge, result in the fullfilment of its design. Notwithstanding the "Farmer," there are many copies of the RURAL NEW-YORKER taken in the State, and there is room for many more.

When I reached Western New York I was somewhat surprised to see the rapid advances crops, and vegetation of all kinds, had made. I have passed through many localities of this, and adjoining counties, and I invariably find the wheat crop, in growth and general appearance, to look remarkably fine—seldom better. Spring grain of all kinds are coming on very rapidly indeed. Wheat is now in blow, and will be in advance of the usual season of harvesting, if no impediment attend it.

The agriculturist's hopes cannot be otherwise than exalted, and gladdened from the cherished remembrance of the great Giver, for His continued bounties, in the bestowel of abundant success for the toil of his hands. Respectfully,

C. W. HOBART.

## N. Y. Legislature.

### Extra Session.--Synopsis of Proceedings.

MONDAY, June 13.—*Senate*.—The Maine Law bill, after considerable sparring, was referred to a Committee to report complete. Nothing else of importance accomplished.

*Assembly*.—The Canal business was made the order of the day for Tuesday. Some talk and progress in various matters, but nothing finally perfected.

TUESDAY, June 14.—*Senate*.—The Maine Law, with the clause submitting it to the people, was passed by a vote of 17 to 13. Bills were passed to allow the Pennsylvania Railroad Co. to construct a road in this State; to incorporate the Pacific Railroad Co.; to continue the Staten Island Co. Favorable reports were made upon several less important bills.

*Assembly*.—The Canal Compromise was *adopted* without opposition. The vetoed Banking Basis bill was tried again and lost—Ayes 37; Nays 55. The Senate bill to extend Banking Basis was taken up, but not voted upon. The Niagara Ship Canal bill passed—68 to 28, but the vote was reconsidered, and the bill is yet open.

WEDNESDAY, June 15.—*Senate*.—The Canal Compromise passed 29 to 1. Various other matters were debated.

*Assembly*.—A debate on the impeachment case occupied the most of the day. Thirteen bills of a local character were passed however.

THURSDAY, June 16.—*Senate*.—There was a long and rather personal debate, upon an application by Mr. Taber, to have his name recorded in favor of the Canal Resolutions. The Catholic Church Property bill was also discussed in Committee, and so amended that no corporation can be made under the Act, unless two-thirds of the Corporation be neither bishops, priests, nor ecclesiastics. The bill was subsequently laid over, until Mr. Taber should be well enough to be present. The General Life Assurance act was passed.

*Assembly*.—Several bills were reported, and the special order—the Impeachment case—pretty extensively debated.

FRIDAY, June 17,—*Senate*.—A debate on the catholic bill occupied the greater part of the morning. In the afternoon the same was continued and the bill amended and ordered to a third reading by a vote of 16 to 8. Adjourned to Monday noon.

*Assembly*.—The Impediment question was debated somewhat in the House and laid over to Monday, to which time the Assembly adjourned.

Monday, June 20,—*Senate*.—No quorum. Adj.

*Assembly*.—Ten present and nothing accomplished.

## Literary Notices.

DR. GRANT AND THE MOUNTAIN NESTORIANS.—By Rev. THOS. LAURIE, surviving associate in that Mission. With Portrait, Map of the Country, Illustrations, etc. Boston: Gould & Lincoln. 1853.

THIS volume supplies a want long felt, for a full and suitable record of the eminent worth, devoted life, and arduous labors of this celebrated Missionary physician. His labors in Persia, are everywhere known, and his memoir must meet with a ready sale among his many admirers. Those who have not heard of him will read to venerate his worth. Sold by SAGE & BRO., Rochester.

MEMORIALS OF THE ENGLISH MARTYRS. By Rev. C. B. TAYLOR, M. A. New York: Harper & Brothers. 1853.

THE localities hallowed by the blood of martyred saints—WICLIFFE, LATIMER, RIDLEY, CRANMER, and many others—have been visited by the author of this volume, and he has interwoven, with sketches of their present condition, the memories which they recall, making a very readable book of some 400 pages. It is well illustrated also. Sold by SAGE & BRO., Rochester.

ARTHUR'S HOME MAGAZINE, for July, commences a new volume of this excellent periodical. Each number contains Eighty Octavo pages, and to the reading matter which these contain are now added, the additional attractions of fine steel plates and many wood engravings. This is a good and cheap family Magazine. Price $2 a year—four copies $5. Address T. S. ARTHUR & Co., Phiabelphia. DEWEY, Agt., Rochester.

ARTHUR'S HOME GAZETTE, published as above at $2 a year, is a very superior Literary and Family Newspaper.

THE NORTH BRITISH REVIEW, for May, should have been noticed before, but it may not now be too late to say that it commences the nineteenth volume of that able quarterly. New York: L. Scott & Co., $3 per annum. DEWEY, agent.

## News Brebities.

—— Ripe peaches were among the luxuries at New Orleans on the 6th inst.

—— Gavazzi did not return to Montreal to finish his lectures as he announced.

—— The Elmira Republican goes in for a Convention of Editors in Western New York.

—— Patrick Fitzgerald was executed on Friday last, in New York, for the murder of his wife.

—— A fire occurred in Cincinnati on the 10th which destroyed about $50,000 worth of property.

—— Foreigners arrived at New York during a portion of last week at the rate of about 3,000 a day.

—— They are successfully trying the experiment of running steam barges on the Schuylkill Canal.

—— The epauletts worn by Prince Albert, when in full costume are worth five hundred pounds.

—— Ninety free colored persons, from Tennessee arrived at Savannah last week, to embark for Liberia.

—— Under the late decree of the Mexican Government, twenty-six newspapers have been suspended.

—— The owners are confident that the Ericsson will be in readiness for sea the last of September next.

—— T. H. Hyatt, Esq., editor of the Rochester Daily Advertiser, has been appointed Consul to Amoy, China.

—— Counterfeits on the Hudson River Bank of New York, are said to be in circulation and good imitations.

—— A new bank has been organized at Auburn, under the name of the "Auburn City bank." Capital $200,000.

—— The penny subscriptions in England to be placed in the hands of Mrs. Stowe, already amount to $6,000.

—— For three hours in the middle of the 9th day of June the mercury, in Hartford, Conn., indicated 89½ degrees.

—— Several of the leaders in the late revolt at Vera Cruze have been publicly shot, among them Gonzales and Centeris.

—— Every Cuban slave-holder pays a tax of one dollar per month for every slave he owns.—This is the Queen's tax.

—— Unusual sickness prevails at Alexandria D. C., including, as is reported, several decided cases of Asiatic Cholera.

—— 10,000 copies of Fanny Fern's Book have already been sold, and 2,000 more ordered. A slight sign that it takes well.

—— It is thought by French physicians that Louis Napoleon cannot survive much longer than a year. He is in very ill health.

—— There are about 1,999 men employed on the Williamsport and Elmira Railroad, which force is to be doubled in a short time.

—— Mr. Wilson, the Mayor of Montreal, has been arrested and held to bail at the instance of the late Mr. Peter Gillespie's friends.

—— Another wife has been murdered in New York, and the brutal husband, James Sally, who committed the act, has been arrested.

—— Accounts from Arkansas represent the excitement at Camden, in consequence of the recent reported gold discoveries, as very great.

—— Barnum (*the* Barnum) lost his temper, threatened to lick an Editor, and as a consequence, gets into the Newspaper Police Reports.

—— A young man has been fined $10 and cost in Cincinnati, for refusing to work at a fire. The case is to be carried to a higher tribunal.

—— Mrs. Stowe presented the Black Swan with a splended dress of moire antique, trimmed with bugles, which she wore at a concert.

—— The new stamped envelopes and postage stams are finished, and have been inspected and approved by the Post Office Department.

—— The law of Indiana, with reference to free persons of color, is so severe, that it has caused large numbers of blacks to leave the State.

—— The "Friends of Freedom" will celebrate the Fourth of July at Medina. Hale and Giddings are expected to be present and speak.

—— The first railway in Asia was opened at Bombay amid a vast concourse of people, and unprecedented rejoicings, on the 16th of April.

—— The Episcopal Convention of Rhode Island adjourned on the 16th, without electing a Bishop. The Clerical House could not agree.

—— GOV. Seymour has granted a respite to Bieler, who was to have been hung at Buffalo on Friday, 24th inst., until the 5th day of August.

—— A Russian Imperial Ukase obliges all young men to enter the army at the age of 18, those only excepted who are noble by descent.

—— Homer Ramsdell, Esq., of Newburgh, has been elected President of the New York & Erie Railroad, in place of Benj. Loder, Esq., resigned.

—— The celebrated temperance orator John B. Gough, has been engaged to deliver a course of lectures in England, during the month of August next.

—— The whole number of vessels that have been sent at various periods to look after Sir John Franklin, the missing navigator, is about thirty.

—— Daily Evening Watch-Tower is the title of a new paper published in Adrian, Michigan, from the power-press of R. W. Ingals. It is Democratic in politics, and exhibits considerable enterprise.

—— Five dollar counterfeit bills of the Ilion Bank, Herkimer, are in circulation. It is supposed that there is a good deal of this spurious paper in circulation.

—— On the 13th, a train was run from this city to Lockport in one hour and eleven minutes, running time, equal to a mile in one minute and thirteen seconds.

—— A California correspondent of the Salem Gazette says that the potato rot has made its appearance in Sonoma Valley, and done considerable injury to the crops.

—— A correspondent of the Littleton Reporter saw the other day Mr. Jonathan Kimball of Lisbon, aged 87, holding a breaking up plow, while his son aged 67, drove the team.

—— A train composed of 70 loaded cars, containing each ten thousand feet of lumber, drawn by one engine, passed over the N. Y. & Erie R. R. last week, making regular time.

—— The Springfield Republican says they have had a direct importation of seventy-three Scotch girls, at Holyoke, all of whom are employed as operatives in the mills at that place.

—— Rev. Mr. Magoon, of the Baptist Church, has been invited to deliver the annual oration before the Literary Societies of Brown University, at the Commencement in September next.

# Foreign Intelligence.

## Arrival of the Asia.

The Steamship Asia arrived at New York on the 16th inst. Her news dates June 4th at Liverpool.

Markets.—Cotton steady during the week; sales 50,790 bales; speculation, 9820; export 3470. Wheat advanced 2d and Flour 1s in the week: an active consumptive and speculative business. Money scarce. Bank of England had advanced the lowest rate of interest to 3 1-2 per cent. Consols closed at 99 1-2 for opening, ex div. American securities steady.

Summary.—The political intelligence by this arrival is of a more peaceable nature, and there is now every probability that the difficulty between Turkey and Russia will be amicably adjusted. In Switzerland, however, the signs are warlike. Extensive preparations were making to resist the encroachments of the Austrians. Cuban affairs were still the theme of discussion in Parliament. The Bank of England had advanced the rate of discount to 3½ per cent. The quotations for cotton were unchanged, and breadstuffs were active.

## Wool Clip, and the Prices.

The Wool Clip of the United States is a very important portion of our products, and is continually receiving, as it deserves, increasing and enlightened attention. The Clip is coming forward freely, for which fair though not extravagant prices are obtained, with strong indications that no permanent decline may be anticipted. The following notes of transactions at different points may prove interesting to our readers. Comparatively little wool has yet been sold in our own market, but this is not a wool growing region:

The Cleveland Herald, of the 17th inst., says:—"Contrary to expectations, the local markets have thus far shown less than the usual fluctuations in price. The system of contracting which was entered into largely during the months of January and February throughout the west, was a new feature in the trade—and was cut short by the money panic at that period. The "high contracting powers" about those days were very anxious to sell out, as our market reports for the period showed, but they were unable to do so.—It is hinted that the agent came into the field in May, uncertain whether to meet the enemy and "foot up," or lose the advance made on the contract purchases; but the prices then made have been more than supported, and we consider prices in comparison with last year from 15 to 17 cents above what was then paid for the clip of Ohio, and the same will hold good for the whole West, with little variation. The contracts and purchases made so far, we think, are full three-fourths of the clip of this State, at 40 to 65 cents for the different grades, and it must be very welcome to our growers to take the money at such prices for their Wool."

The Lancaster (O.) Gazette, of recent date, remarks: "We learn that Messrs. J. M. Ashbrook and James T. Church, of Pleasant Township, recently clipped 1,425 sheep, yielding some 4,275 pounds. They sell 1,100 fleece at 55 cents per lb; and the balance for 50 cents. Wool is now retailing at high figures and no fears are entertained, we believe, of a decline in the price."

The Warren (O.) Transcript says: "A large amount of fleece has been brought in during the week, and disposed of to purchasers at from 40 to 50 cents for common, according to quantity and condition. It is thought, however, that such prices cannot long be maintained. If so, farmers who have not yet disposed of their clip, would do well to hurry it in."

The Steubenville (O.) Union says, that 45 to 50 cents is offered for three-fourth and full blood. Sellers ask 55a60. This varience induces growers to hold on to their clips. We learn that the same diversity of views prevails generally throughout that section.

From other points in Ohio we hear the clip comes forward freely, though there are some instances where for want of satisfactory prices wool is withheld.

The Detroit Advertiser, of 16th inst., says:—"The receipts to-day, have not been quite as heavy as they were yesterday, not reaching over 9,000 lbs. Washed wool has ranged all day at prices varying from 43 to 56 cents, according to quality. Several of the lots brought in, weighed from 288 to 420 lbs.

The Wellsburg (Va.) Herald, remarks: "It may not be generally known that there is no better market, especially for fine wool, in the Union, than Wellsburg, yet such is the fact. Wool raised within scope of our circulation, compares advantageously, as a staple, with any raised in the world. 75 cents to $1 per pound is no unusual price."

From the Philadelphia North American we learn that "The new clip comes in slowly, and the market remains quiet, with rather a better feeling to notice on the part of holders, who are firm in their views. The weeks sales reach some 50 or 60,000 lbs., mostly in small lots and at full prices. among which 12,000 lbs. No 1 pulled at 40c.; a lot of Western do at 43c, and a small lot of fleece hardly full blood, at 60 cents, all on the usual credit."

The Poughkeepsie Eagle says: "The market for wool is improving in various sections of the country. Sales have been made from 50 cents to 62½, according to value, and a few sales of superior as high as 65. It is said the demand is increasing."

Wool.—Wool came in very freely last week, and was sold at prices varying from 45 to 56c.—On Saturday, the prices went down 6 to 8 cents per lb.; on Tuesday, the prices ranged from 45 to 53, but many farmers feeling disappointed at the fall drove, there fleeces home. There was purchased last week in this village, 17,038 lbs.—*Jonesville* (Mich.) *Telegraph*, June 15.

The Strawberry Trade.—One hundred and fifty country wagons crossed the Hoboken ferry on Wednesday evening last, loaded with strawberries for our city markets; and the average for about every evening in the week, and nightly, all last week, is full one hundred. The yield of this delicious fruit this season is said to have been prolific beyond all precedent, and the profits of course, are proportionably increased. One gardener who has a patch of ground on the Hackensack, informs us that he will clear $400 this season, and we have heard of several others from the same district, who expect to exceed that sum. The fruit is selling in the markets at very low prices—that is to say, often at four baskets for a shilling for fair qualities; but the best go as high as six cents, and sometimes a shilling, the basket.—*N. Y. Express.*

## N. Y. State Agricultural College.

This Institution was chartered by the Legislature of the State of New York, for the purpose of presenting to Agriculturists the means for acquiring a knowledge of the Arts and Sciences appropriate to their vocation; to prepare Students for practical, active labor, by training the mind in a system which shall inculcate an intimate acquaintance with the sciences essential to agricultural success.

To insure the development of principles and their application to the soil, the Legislature has required the purchase of not less than three hundred acres of land.

The Trustees, having accepted the trust confided to them by the Legislature, organized the State Agricultural College, by the following appointments:

JOHN DELAFIELD, President of the College.
Hon. JOHN A. KING, Ch'n of the Board of Trustees.
JOEL W. BACON, Secretary.
N. B. KIDDER, Treasurer.

At a meeting of the Board, on the 4th of June, a Report was presented by B. P. Johnson, from a Special Committee, on the Location of the College, declaring "that after an examination of the Oaklands Farm in Seneca County, they are entirely satisfied that the price asked for it, is its fair value in the market, for farming purposes; that it is, by previous preparation, by position and variety of soil, in every respect adapted to the objects of the Institution; that the title is perfect, and recommend that the chain of title be entered at large on the minutes of the Board," &c. This farm is situated midway between the market towns of Waterloo and Geneva, and in full view of the Seneca Lake, and overlooking the village of Geneva; elevated about 125 feet above the lake, it is free from causes disturbing health; its soil varies from a strong clay to a sandy loam, presenting varieties sufficient for testing by experiment every doubtful question in relation to soils, and to exhibit the most approved system of cultivation.

The Trustees are prepared to receive from Farmers and friends of agriculture, proposals for the Capital Stock of the Institution, which will be distributed in shares of fifty dollars each, payable

10 per cent on Subscribing.
40 " 1st July.
50 " 1st October.

The Trustees may be addressed (post-paid) at their respective residences, as follows:

Hon. John A. King, Jamaica, Queens County.
Henry Wager, Westernville, Oneida "
B. P. Johnson, Agricultural Rooms, Albany.
Wm. Kelly, Rhinebeck, Duchess Co.
N. B. Kidder, Geneva, Ontario Co.
Joel W. Bacon, Waterloo, Seneca Co.
Tallmadge Delafield, Geneva, Ontario Co.
Wm. Buel, Rochester, Monroe Co.
John Delafield, Oaklands, Seneca Co.

The Officers of the College will endeavor to present subscription books in each County, that the College, so entirely agricultural and peculiarly the Farmer's institution, may find its support widely diffused throughout the State.

The President will, upon application to him, give all needful information in relation to the ordinances, rules and regulations of the College, and the courses of instruction to be pursued.

By order of the Board of Trustees,
JOEL W. BACON, *Secretary.*

# Market Intelligence.

Rural New-Yorker Office,
Rochester, June 22, 1853.

Farmers are now so thoroughly occupied with seasonable labor, that few of them find time to attend to marketing, consequently very little country produce is brought forward—and the market is without animation.

Flour—A good feeling prevails, and all offering from country mills finds sale at current rates.

Grain—There is some demand for wheat which comes in sparingly. The market cannot be quoted at over $1,16 @1,17 for prime lots. Corn is in demand at 63@64 cents. Oats not pleuty and bring 41@42c. Other grain inactive.

Provisions—In the provision market very little doing and prices merely nominal.

Wool—On the preceding page will be found some extended items concerning the wool market. Not much is ever marketed here, and this season less than the usual amount is offering. We quote prices as follows:

| | |
|---|---|
| Common, | 36@38c. |
| ¼ blood, | 40@42c. |
| ½ do. | 45c. |
| Merino, | 50c. |
| Saxon, extra, highest | 55c. |

### Rochester Wholesale Prices.

| | | | |
|---|---|---|---|
| Flour, bbl | $4,75@5,25 | Butter, lb | 12@12½ |
| Pork, mess, | 15,00@15,50 | Cheese, | 8@9 |
| Do. cwt, | 6,50@7,00 | POULTRY. | |
| Beef, bbl. mess, | 10,00@10,50 | Turkeys, lb | 9@10 |
| Do. cwt, | 5,00@6,00 | Chickens, | 8@9 |
| Lard, tried, | 10@11c | SEEDS. | |
| Do. leaf, | 11c | Clover, bu | $6,75@7,00 |
| Hams, smoked, | 10@11c | Timothy, | $2,25@3,00 |
| Shoulders, do., | 8@9c | Flax, | 1,25@1,37½ |
| Potatoes, | 25@37½c | SUNDRIES. | |
| GRAIN. | | Whitefish, bbl. | $8,50@10,50 |
| Wheat, bu | $1,16@1,17 | Codfish, cwt, | $4,50 |
| Corn, | 63@64c | Salt, bbl | 1,63 |
| Buckwheat, | 44 | Apples, bush | 50@63 |
| Rye, | 56@62 | Do. dried, | $1@1,25 |
| Oats, | 41@42 | Eggs, doz | 10@00c |
| Barley, | 00@56¼ | Beans, bu, | 1,00@1,12 |
| HIDES. | | Hay, ton | 10@14 |
| Slaughter, cwt, | 3,50@4,00 | Wood, hard, cord | 3,50@4,50 |
| Calf, lb | 6@8 | Do. soft, | 2@3,50 |
| Sheep Pelts, | 1,00@1,75 | Wool, lb | 45@53 |
| Lamb skins, | 50@75 | Flour barrels, | 36@37 |

## NEW YORK MARKET.

NEW YORK, June 20.

Flour—There is little variation to note in Western and State flour; arrivals light, owing to the detention of the tow on the overslangh—shippers less disposed to purchase and the market closed dull. Canadian better demand—firm. Sales at $4,44; Western Canal at $4,62@4.68 for common to straight State—$4.31@4,81 for common to good Ohio—$4,68@4,81 for Michigan—the latter scarce.

Grain—Wheat—in fair supply—demand less active.—Sales red Ohio to arrive, on private terms.

Barley—dull and nominal—60@62c.

Oats—lower, dull—42@43½c Jersey; 43@45½c Southern and Western.

Corn—a shade better—in good demand. Sales, 55@56c for hot and unsound; 60@61c for Southern mixed; 61@62½c for white Southern; 62@63½c for Western mixed; 64@65c for Southern yellow.

Rye—easier. Sales 91c for Jersey; 94c for river in the slip.

Provisions—Pork in steady demand and moderate—$15,-75@15,81 for mess—$13@13,68 for prime—$17@17,25 for clear.

Beef unchanged—$8@10 for country mess—$11,75@12,-75 for repacked Chicago—$12@12,75 for city mess—$5@6,25 for country and city prime—prime mess $18@20.

Lard better supply and demand fair—sales at 10@10½c.

Butter easier, and plenty—10@15½c for Ohio—14@19c new State.

Cheese lower and quiet—6½@8½c.

## ALBANY MARKET.

Albany, June 20.—The market opened dull for all articles and closed without animation. The sales of the day have been small and quite unimportant.

Flour, &c.—The demand for Western and State Flour is small, but there is no change in the value of either description. The stock is accumulating. The sales indicate no change in prices since Saturday.

Grain—Nothing has transpired in wheat. The demand is fair, but we can learn of none offering except to arrive. Corn is dull and lower. Sales Western mixed at 62c; unsound is very plenty and slow of sale. Oats are plenty, and the market is dull and drooping. We quote 40@42c. for Western and State with no sales. Barley and Rye are quiet.

## BUFFALO MARKET.

Buffalo, June 20.—There is more animation in the flour market this morning and a better feeling on the part of buyers. The transactions would be much larger if boats were more plenty. Sales 500 bbls. Ohio and Indiana at $4,12½—250 bls. Ohio and Michigan at $4.12½—200 bls. Indiana at $4,12½—200 bls. Ohio at $4—100 do. at $4-06¼—50 do. at $4,12½, and 150 bls. fancy Ohio at $4.25.—In addition to these sales, about 350 bls., fancy and extra, sold in small lots at $4,18¾@4,56.

There is an active inquiry for wheat and the market is firm, particularly for white. The sales which fall under our observation are white Michigan at $1,05—white Ohio and white Michigan on p. t.—mixed Milwaukee in two lots at 84c, and a cargo of Upper Lake Spring at 78½@80c.

Corn quiet and transactions restricted by the scarcity of boats. Good samples of sound are offering at 52c, but we hear of no sales, except some warm at 46½c. afloat.

Oats quiet and in moderate inquiry at 35c.

## NEW YORK CATTLE MARKET.

NEW YORK, June 13.—At Washington Drove Yard—At market, 2,500 Beef Cattle, (all Southern and Western) market firm at 9 to 10½c. per lb.; about 300 head left over.

At Browning's—In market 3,500 Sheep and Lambs,—all sold at prices ranging from $2,75@3,85 to $6 for Sheep, and $2,25@4 to $6 for Lambs.

Cows and Calves—150 offered, and all sold at from $25 @35 to $50.

At Chamberlain's—Offered, 350 Beef Cattle—Prices 8 to 10c.

Cows and Calves—sales at $25 to $35@50.

3,500 Sheep and Lambs offered; all but 200 sold at $2,25 @3,50 to $4,25@6 for Sheep, and $2,25@3 to $450, for Lambs.

## ALBANY CATTLE MARKET.

ALBANY, June 20.—W. W. Woolford's, Bulls' Head, Washington street.

Beef Cattle—At market, 620. Prices—Extra, $7,50; 1st quality, $7; 2d do, $6,50; 3d do, $6.

Cows and Calves—30 in market. Prices from $25, 30, 35 to 40.

Sheep and Lambs—1,274 in market. Prices $2,50, $3 to $3,50.

Hogs—50 in market. Prices from $5, 5,50 to 6.

Remarks—The market is rather on the decline.

## CAMBRIDGE CATTLE MARKET.

CAMBRIDGE, June 15.—At market, 608 Cattle, about 550 Beeves, and 58 Stores, consisting of Workiug Oxen, Cows and Calves, yearlings, 2 and 3 years old.

Prices—Market Beef—Extra sold at $8,25@8,75 cwt.; 1st quality, $7,50@8; 2d do, $7,25@7,50; 3d do, $7; ordinary, $6,25@6,50.

Hides—$4,75@5 per cwt.
Tallow—$7@7,50 per cwt.
Pelts—$1@1,50.
Calf Skins 10½@11c per lb.
Barreling Cattle—None.
Veal Calves—$2, 5, 8; 465 at market.
Stores—Working Oxen—$102, 112, 121, 131@152.
Cows and Calves—$20, 30, 32, 36 @75.
Yearlings—$12, 13@13,50.
Two years old—$27, 34, 36@42.
Three years old—$42, 47, 51@65.

Sheep and Lambs—1,379 at market. Sheep plenty—and sales are hard.

Extra, $5, 5,50 to 8, and few at that price.
By lot—$2, 2,25, 2,50, 3, 3,25@4,50.
Swine—None at market.

Remarks—The market is well stocked, and the sales slow, but large, notwithstanding. Mr. J. Philbrick, from Northampton, N. H., had 103 head of beeves, to-day—many of them large, very fat, fair and handsome. Messrs. R. Stoddard, of East Abington, and O. G. Pinkham, of North Bridgewater, had 13 blood Black Hawk and Morgan Horses, the best lot at market this season. They came from Vermont and Canada.

## BRIGHTON CATTLE MARKET.

BRIGHTON, June 16.—At market 700 Beef Cattle, 20 pairs Working Oxen, 35 Cows and Calves, 1,800 Sheep and 1,200 Swine.

Prices—Beef Cattle—A full supply. Extra, $8,25@8,75; 1st quality $7,50@8; 2d do, $7@7,50; 3d do. $6@6,50.

Working Oxen—Few sales $70, 90, 110@125.

Cows and Calves—Sales $24, 29, 35, 40, 47@60.

Sheep—Sales from $2,50@3,50 and $4,50.

Swine—Ohio shoats to peddle 7c for sows, 8c for barrows; old hogs 6¼c; spring pigs 10c. At retail from 7½ to 9c.

# Marriages.

In Greece, on the 12th inst., by the Rev. J. Woodward, Mr. JOHN S. BROWN and Miss ANN ELIZA BIGELOW, both of Greece.

In Clarkson, on the 5th inst., by Rev. E. Hannibal, Mr. WARREN BLOSSOM and Miss EUNICE BATES, all of Clarkson.

# Deaths.

In Clarkson, on the 6th instant, LOVICA, wife of M. C. Witbeck, Esq., aged 60 years.

In Chili, on the 20th inst., WILLIAM PIXLEY, Esq., Supervisor of the Town, aged 69 years. He was one of the pioneers of the town, having settled near his late residence as early as 1818.

## GREAT STOCK SALE.

**Short-horn and Durham Cattle, and Southdown Sheep.**

On Wednesday, the 7th day of September next, at one o'clock, P. M., I will sell, at my farm on Grand Island, six miles below Buffalo, about 30 full bred Short-horns, a few Devons, and about 30 high grade Short-horn and Devon Cattle, consisting of Cows, Heifers and Young Bulls.

The young Short-horns are chiefly the get of my imported bull Duke of Exeter (10,152)—a bull not exceeded, as a fine stock getter, by any other in the U. States.

The young Devons are the get of the bulls Candy and Quartley, both imported by Mr. Stevens. The superior of these bulls in blood, style and breeding, is not to be found. Quartley is my present stock bull.

I will offer at the same time 50 pure bred South-Down Sheep-rams and ewes. Also a few Middlesex pigs—both sheep and pigs the direct get of imported sires, from dams descended from late importations.

Catalogues will be ready by the first of August, and will be sent on application to me, by mail.

Terms:—All sums of $100, and less, cash. For larger sums, approved notes at four months, with interest, payable at Bank, will be received, if preferred.

A steamboat will carry all persons wishing to attend, across the ferry from Lower Black Rock to the farm, at 10 o'clock on the morning of the day of sale. The stock can be viewed at any time previous, by calling on me at my residence in this place. LEWIS F. ALLEN.

Black Rock, N. Y., June 15, 1853. 182-10t

## ATKINS' SELF-RAKING REAPER.

This Machine is now offered to the public and warranted to be a good Self-Raking Reaper. It is also believed to be a good mower, but not yet having been sufficiently tested in grass (though it soon will be) it is not warranted to be equal to a machine made mainly or wholly to mow.

The raking apparatus is of novel and very simple construction, and not liable to derangement, and every farmer who has seen it in the harvest field, says it performs the raking better than a man can possibly do it.

Price of machines at Chicago, $175, of which, $75 must be paid on giving the order, $50 upon successful trial, and $50 in note payable 1st Dec.

The machines are most thoroughly built and warranted.

☞ Descriptive circulars, with cuts, sent to post-paid applications. [182u3.] J. S. WRIGHT.

"Prairie Farmer" Warehouse, Chicago, June, 1853.

## SUFFOLK PIGS FOR SALE.

Twenty pairs of pure bred *Suffolk Pigs* for sale by the subscriber. They can be safely forwarded by Railroad, Express, &c., to almost any part of the country.

Address C. J. HOLDEN,
June, 1853. [182-2t*] Walepole, N. H.

## PREPARED SUPER PHOSPHATE OF LIME,

BY THE UNION CHEMICAL WORKS, L. I.

HOYT & CO., Agents,

*No. 234 Water Street, and 122 West St., corner of Dey St., NEW YORK.*

A Fertilizer of the most approved quality, producing all the immediate effect of the best Peruvian Guano, with the advantage of being much more lasting in the soil.—Thoroughly tested, and found to more than realise the expectations of all those who have already tried it. The best evidence of this is the largely increased demand this season over the past year. Put up in bags of 160 lbs; barrels 250 lbs each. Buyers will please be particular to observe our brand upon each bag or barrel.

Also for sale, American and Foreign Field and Garden Seeds. English Ray Grass, Foul Meadow Grass, fine mixed Lawn Grass, White Clover, Osage Orange, &c.

17Sm3i.

## DRAIN TILE MACHINE.

The Subscribers are manufacturing at their machine shop, at North Bloomfield, Ontario Co., N. Y. Machines of an improved pattern, and most durable construction, for the use of moulding drain tile, bats for crocks, &c.

Orders by mail or otherwise, punctually attended to.

FAIRCHILD & WOOD.

North Bloomfield, N. Y., April, 1853. 173-3toam

## DAGUERREOTYPES.

The Subscriber continues the business of Daguerreotyping, at his old stand in Chappell's Block, 82 State-st. Grateful for past favors, he will, as heretofore, adhere to the motto, that "whatever is worth doing at all, is worth doing well,"—trusting therein for a continuance of public patronage. Pictures copied, and all other work done in the highest style and finish known to the Art.

Rochester, Jan., 1853. [162-oam] S. B. SMITH.

Haying Tools, Dont forget to buy them of Halloek 24 Exchange-st., Rochester, who has the largest, best and cheapest assortment.

## FIRST PREMIUM REAPER.

At the great Trial of Reapers in the Harvest Field at Geneva, N. Y., in July last, the Burrall Reaper, in competition with eleven others, was awarded the

**FIRST PRIZE OF FIFTY DOLLARS!**

and also a Diploma, by a Committee of twelve, appointed by the New York State Agricultural Society. The Committee, in their Report, remark, that "T. D. Burrall's machine performed its work in the *most admirable* manner; the gavels were well laid; the *workmanship* and *materials* were *excellent;* the *circular* apron for side delivery, the *balance wheel*, and an arrangement to elevate the exterior edge of the apron, are valuable features," &c., &c.

During the last two years a large number of these Reapers have been in use, giving entire satisfaction in all cases. This cannot be said, in truth, of any other Reaper. We have received letters from more than fifty practical Farmers of Western New York, who have purchased and used this machine, and all speak of it in the highest terms of approval—pronouncing it *superior to any other* that has come under their observation. We have published the larger part of these letters in a hand-bill which we would be pleased to furnish any who may apply either by letter or otherwise.

☞ This Reaper has no band-wheels, pullies, straps, or harness of any kind to get out of order, as is the case with other Reapers; but, on the contrary, it is simple and compact, being made of few parts, well arranged, and each part having its proper relative strength—consequently, it is durable. Its draft is light, and the grain is delivered from it with ease, and in nice order for binding. In all these respects it is superior to any other Reaper. It so struck the Committee at the great trial at Geneva, and occasioned them to remark in their Report, that "it performed its work in the *most admirable manner*, and that the *gavels were well laid*," &c., &c.

The cutting of wheat, barley, oats, rye, buckwheat and seed clover, is so important to the farmers of grain growing districts that they should see to it, that they do not get forced upon them a second or third rate machine for these purposes. No small consideration, at least, should induce them to have any thing other than the best. But how shall it be determined which is best, when manufacturers and agents each, assert the machine in which he happens to be particularly interested, to be the best? Under this state of things the question should be determined in favor of that machine, the manufacturer or agent of which can produce the largest amount of reliable evidence of its superiority. Interested persons are not always to be trusted, but generally disinterested persons are. Well, then, who can produce the best and most evidence from the class which is reliable? We claim that we can; and we will begin by reasserting that a Committee of twelve disinterested persons, after seeing all the Reapers of any note at work side by side, which was the greatest test ever had, pronounced the Burrall machine the best. *They* did not call any other best.

We also say that of all the Burrall Reapers sent out not one has been returned. All have given the most entire satisfaction, and in most cases have far exceeded the expectations of purchasers. These assertions cannot be made, in truth, in reference to any other Reaper. We are therefore, willing to leave the question, which is best, to be settled by the *disinterested;* and we would say, inquire of those of that class who have knowledge on the subject, and also examine the different machines for yourselves, and if you do not become convinced that ours is the most simple and durable—that it will cut when driven either slow or fast—that it will cut green or grassy wheat—that its draft is comparatively light—that the grain can be got off from it with ease and in nice order for binding—then don't purchase this Reaper; but if you find it equal in all these good qualities, and far superior in many, to any other Reaper, then those who have not already done so, will please hand in their orders as early as possible, either to our agents or ourselves. This will enable us more fully to supply the demand.

The undersigned have the *exclusive* sale of the Burrall Reaper in the State of New York, west of a line passing north and south through Canandaigua,—and those therefore, who desire to purchase will please hand their orders to either ourselves, or our authorized agents, who will make sales on equally as favorable terms. We also have the right of selling machines for use in any of the States and the Canadas.

[181-3t] BRIGGS & BROTHER,
June, 1853. 68 State st., Rochester, N. Y.

## M'CORMICK'S PATENT REAPING AND MOWING MACHINE!

With the advantage of large experience, for many years, in the exclusive business of making and selling these machines, I have during the last harvest, and since that time devoted much time and expense in experimenting to perfect my machine as a reaper and mower, and am now prepared to warrant this machine superior to every other as a reaper and as a mower. The attention of Farmers is called to the following Improvements for 1853:

1st. Iron Beam for combined machine, which allows the grass to pass over more freely, together with improvements in the fingers.

2d. A *self-adjusting* arrangement for mowing, by which the beam rises and falls, and thus accommodates itself to the inequalities of the ground, which is very important for mowing, though entirely unnecessary for reaping.

3d. Very fine cut sickles for grass. These improvements insuring the perfect performance of the mower.

4th. Shortening the platform and placing the raker closer to his work in reaping.

5th. A new and beautiful arraugement by which the machine may be raised from the ground to any desired height in five minutes time, with the main wheel enlarged.

From the well known reputation of my machine, in the hands of more than 7,000 farmers, in this country, and that it has maintained its high superiority, wherever it has been fairly tested. Having again, after a series of trials at the last harvest in England, and after a contest with Hussey's, in a trial of nine days, upon the Royal Agricultural farm, which was the most extended contest ever made with Reapers in any country, been declared by the able jury of English farmers (see their report in my handbill,) decidedly the best machine, capable of cutting when the grain was green or ripe, wet or dry, in all weather when Hussey's could not be worked.

The verdict was that McCormick's machine is entitled to general patronage, that it was considered next to perfect in principle, such as good cutting at any pace of the horses; proper delivery at the side, and economy of both house and man labor—an implement that might be depended upon for a harvest by any farmer. Further testimonials of its superiority can hardly be necessary.

To convince such responsible farmers as are in doubt, which is the best machine, and of my entire confidence in the superiority of my own, I will permit them to take one of mine, with one of Hussey's or Burrall's on trial, to keep the one preferred.

That Manny, Seymour & Morgan, and others, who are making and selling my machine, *in a changed and injured form*, with the hope of being able to avoid the responsibility of infringing my patent, is the best evidence of the superiority of my machines. They will all be held responsible, and their infringements arrested as soon as the law, which is sure, can have its course. Those purchasing and using their machines, become jointly liable with them.

The purchaser of the Reaper and Mower will save $85 of the expense of a Reaper and Mower if purchased separately. The machines will be forwarded to any part of this State or Canada, if ordered in season of Thomas J. Paterson, General Agent, Rochester, N. Y.,—office No. 6 Burns' Building—subject to freight from Buffalo. Price $110 cash; or $115, $30 payable on delivery, and the balance on time, and $25 cash addition, or $30 on time, for mowing attachment. A Reaping machine alone, an excellent article, can be had for $100 cash or $105 on credit, for which mowing attachments will be furnished next year. C. H. McCORMICK.

June 15, 1853. 181tf.

## THE TIME OF DAY.

*New and Splendid Jewelry Store, just opened, with a New and Superb Stock of Goods, etc.*

JACOB PICARD, begs most respectfully to inform the public, that he has just opened the new, splendid and capacious Store, under the American Hotel, No. 96 State street, corner of Mumford street, Rochester, with an entirely new and superb stock of modern goods, recently imported or selected from the largest manufactories in New York, &c., in Watches, Jewelry, Clocks, Silver and Plated Ware, &c., which he is prepared to sell at prices lower than any other establishment in Western New York.

Those wishing to purchase will find at this Establishment an extensive variety of all kinds of goods to select from, all of which are of the best quality, and at the lowest prices.

J. P.'s stock consists of Gold Watches, from $25 to $225, warranted for one year. Silver Watches from $9 to $50; also warranted for one year.

Ladies' and Gentlemen's Jewelry, in immense variety, and combining all descriptions.

A large assortment of Clocks, from 1 day to 21 days' time, and from $1,50 to $75.

Mr. P. has constantly engaged, two workmen of considerable experience at Watch, Clock and Jewelry Repairing. Watches cleaned and kept in order by contract.

Buyers, remember the address:—Jacob Picard, Watch, Jewelry and Clock Establishment, No. 96, corner State and Mumford sts., Rochester. 179-tf.

To Printers.—For Sale.—A quantity of good Type, consisting of about 250 lbs. of Long Primer; 250 lbs. of Bourgeous; and 150 lbs. of Nonpareil.

Also, a number of Cases, Galleys, &c., &c.

Apply at the office of the Rochester Temperance Journal. 178wtf

## SEYMOUR & MORGAN'S PATENT NEW YORK REAPER, FOR 1853.

The great value and importance of the *Reaper* to Grain Growers of the world, is established beyond a question of doubt. Frequent tests have been made before Agricultural Societies both in this country and in England, proving the Reaper to save in a single harvest its first cost to the purchaser, over the ordinary way of cutting grain. Probably no implement is as valuable to the farmer where any considerable quantity of grain is raised, as the Reaping Machine.

At the present time there are several very good Machines before the Public, and now the question seems to be—which is the best? We claim precedence for ours, considering some of the following principles embodied in our Patents, that are essential to a Reaper and can not be found in any other Machine; which enables us to offer to the farmers of the United States a

**Superior and Perfect Reaping Machine,**

which, for durability, exactness of construction, perfect manner of cutting grain, ease with which it may be worked, and lightness of draught has

*NEVER BEEN EQUALLED!*

1st. The cutter bar is placed nearly on a line with the axles of the driving-wheel, and nearly opposite the driving-wheel is the ground-wheel, which being *thirty inches in diameter*, lessens the labor which has heretofore been performed in working such Machines, and does away with all difficulty in backing and turning.

2d. The knife or sickle is scalloped and in sections, which *cannot be clogged;* and in case of accident can be repaired by any good blacksmith.

3d. The man in discharging the grain stands on the *rear* of the platform, where he has his work before him and can perform it in a perfectly natural and easy manner; and also from the construction of the attendant's stand he may change his position according to the length and amount of straw cut.

4th. The new and improved combination box, containing the smaller gear, combines *great strength* and *durability*, with perfect simplicity of arrangement, preventing any displacement or twisting of the gearing; in this it possesses great advantages over any other similar Machine and so far as we know, there have been no failures in the large number made.

5th. The lightness of the Machine and mainly of the side-draught or pressure, which being obviated, enables a *single team* to pass with it over uneven ground with speed and ease.

We make our acknowledgments to the farmers for that generous confidence we have labored so diligently to sustain; and encouraged by the past, we have again commenced the manufacture of a large number for 1853, which we sell under a strong "warranty." The Reaper shall be well made, of good materials, durable with proper care, can cut from 15 to 20 acres per day with one span of horses, and do the work better than done by ordinary cradling, or no sale!

Innumerable certificates might be given of the great value of this Machine, but our Reaper is so well known, we deem it unnecessary. By reference to the Reports of our State Agricultural Society, on the trial of Reapers, held at Geneva, N. Y., in July last, it will be seen this Machine cut a given amount in about three-fifths of the average time of other Reapers. The following gentlemen are Agents for the sale of the New York Reaper, and any orders received by them will be filled in due season:

S. G. Williams, Esq., of Janesville, Wis., is our General Agent for the West, and is authorized to appoint sub-Agents, except in Ohio and Southern Indiana.

Wm. Bosworth, is General Agent for the State of Ohio except a few counties. Messrs. Warder & Brokaw, of Springfield, Ohio, have the exclusive right to make and vend for Southern Indiana, north to the 40th deg. of lat. running east to the Ohio Canal, including the south-west corner of the State of Ohio.

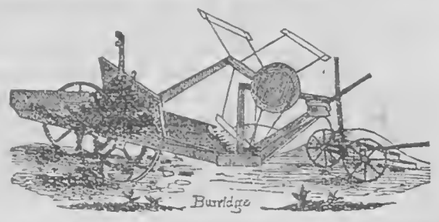
SEYMOUR, MORGAN & CO.
Brockport, Monroe Co., N. Y. [175eowtf.]

E. D. HALLOCK, No. 24 Exchange St., Rochester, has been appointed sole Agent for the sale of the above Reaper, in that city. He will have a Reaper on exhibition at his Agricultural Warehouse, and will at all times be prepared to fill orders at manufacturers prices.



## Manny's Patent Adjustable Northern Illinois REAPER AND MOWER.

First Premium Machine for 1853.

Awarded the First Premium for Mowing and the second for Reaping, at the N. Y. State Fair, in the great trial at Geneva, N. Y., in July, in competition with eleven other machines; awarded a Silver Medal at the Ohio State Fair, for the best Reaper and Mower, and received the highest award at the Vermont and Michigan State Fairs, for the best Reaping and Mowing Machine.

The true merit of this Machine has given it a great triumph over all others, and being a perfect combination of Reaper and Mower, it comes to the farmer with double value, and it is clearly demonstrated to be the only successful combination of Reaper and Mower. As a Mower, it is as simple and perfect as though constructed expressly for mowing; and as a Reaper, it is as simple and perfect as if constructed for reaping only. All the change that is necessary from one plan to the other, is to insert or remove a loose platform.

Machines warranted to cut all kinds of grain as well as can be cut with a scythe, and to cut flax and millet, also to gather clover, timothy and flax seed, and to be well built and of good materials. This machine will cut from ten to fifteen acres per day, with two horses, and one person to tend it when mowing, and two persons when reaping. The cutting apparatus is made perfect by means of a double edged sickle, and double guards, as fully tested the last two years, and it is connected with a joint, so as to adjust itself to uneven ground, and by a level at the driver's seat, it can be raised when moving along, to cut from one inch to two feet from the ground. All side draft against the team is entirely avoided. The machine will turn square corners, and turn square about, either way. Over three hundred of these machines were in use the past season, all of which gave perfect satisfaction.

The machines are manufactured at Hoosick Falls for the State of New York, and I will have them delivered to any part of Western New York where ordered. Price of machine, where made, $125. Address Gen. R. Harmon Wheatland, Monroe Co., N. Y.

The machine is for sale by D. R. Barton, Rochester.
173-tf. R. HARMON, Agent.

## MERCHANTS SUPPLY STORE.

The Subscriber has made extensive arrangements which enables him to supply merchants with any of the tools named in the annexed list, at the lowest current rates, either in large or small quantities. The goods are ordered direct from the manufacturers, and are in every respect the best of their kinds made in the United States.

# Poetical.

## ON HARMONY.

When whispering winds do softly steal
With creeping passion through the heart;
And when at every touch we feel
Our pulses beat, and bear a part;
When threads can make
A heart-string quake;
Philosophy
Will scarcely deny
The soul can melt in Harmony.

O lull me, lull me, charming air,
My sense is rocked with wonders sweet;
Like snow on wool thy fallings are,
Soft, like spirit's are thy feet;
Grief who need fear,
That hath an ear?—
Down let him lie,
And slumbering die,
And change his soul for harmony.

# Rural Sketch Book.

## THE TWO DAGUERREOTYPES.

### CHAPTER I.

Jim Scroggins, though in the main an honest, peaceable, quiet, harmless fellow, had a beastly habit of getting drunk whenever a fit opportunity presented itself; and unfortunately, because "where there's a will there's a way," the opportunities were both fit and frequent.

Jim owned a comfortable homestead, that he had almost paid for. Mrs. Scroggins was a "real worker," and no doubt did her full share in buying the homestead. She was endowed with a great deal of energy, good judgment, and people were so malicious as to say she was the smartest man of the twain.

Be this as it may, Mrs. Scroggins was an industrious woman, and took a good deal of pride in the little place which had been bought by their mutual industry—and the thought of having it wrested from them by a cold-hearted creditor was in the highest degree disagreeable; but to such a calamity her husband's infirmity, as the good minister of the village called it, seemed to point.

The habit grew upon him, as it almost always does upon those who are in the habit of imbibing too freely. The miseries of the drunkard's wife had been too often presented to the good woman's understanding, to be regarded as simply creations of imagination, and she looked forward with alarm to the prospect of enduring them, and losing the little place.

But what could be done? She had exhausted her eloquence upon the infatuated man, without producing anything but a temporary effect. She pointed out to him, kindly, the inevitable effect of his indulgence, and Jim promised to do better; but alas for the vanity of human expectations! he got tipsy the very next day.

Then she appealed to his love of money—to his satisfaction in being the owner of a cottage and ten acres of land, and warming up with the importance of the subject, declared that she would not enslave herself any longer to pay for the place, and then have it taken away from them to pay a rum bill.

Jim listened patiently to the good dame's eloquence, and, as usual, promised to do better, but, also, as usual, he came into the house the very next day, tight as a fiddle string.

Mrs. Scroggins was in despair; "what to do she didn't know," as she expressed it to Parson Allwise, who was a sympathizer with her in distress. She had entreated, she had scolded, she had threatened, and all to no purpose. "What could a body do?"

Parson Allwise himself, though he made it a point not to interfere in the domestic affairs of his parishioners, was at last moved to try his powers of persuasion on the poor fellow.

But Jim, unfortunately for the success of his appeal, had but a poor opinion of ministers in general, and of Parson Allwise in particular, and as good as told the worthy Pastor that he had better mind his own business.

Mrs. Scroggins was shocked at the boldness of her spouse in answering a minister of the gospel in such a pointed manner, and was led to believe that the case was now hopeless indeed.

But woman's wits are equal to almost any emergency; and though she had confessedly given Jim over to the tender mercies of the devil, she could not help thinking it would be a good thing if he could only be saved from himself.

One day, circumstances seemed to conspire in favor of an experiment, which had suggested itself to her fertile brain, and she immediately carried it into effect, with the most happy success as the sequel will show.

### CHAPTER II.

Jim had been cleaning out the pig pen, and as the operation was rather a disagreeable one, he had fortified his olfactories by drinking an inordinate quantity of vile New England rum.

The filthy stuff happily, did not take effect on his brain till the job was done. The pig-pen was cleaned out, but Jim was in a condition which better fitted him to occupy it, than the neat, white-floored kitchen of his cottage. But Jim did not realize this unpleasant truth, and leaving his shovel and hoe in the sty, staggered to the house.

"He was a sight to behold," as Mrs. Scroggins told the minister. The job he had just completed was essentially a dirty one, and Jim, as we have remarked, being prudent, he had prepared himself to perform it without any detriment to the neat garments he ordinarily wore. He was dressed in a ragged suit of clothes, and on his head rested a shocking bad hat, with the crown stove in, and the brim half torn off. As the liquor began to fuddle him, he moved it over from its perpendicular position, so that it rested quite jauntily on one side of his head.

Jim settled himself heavily in a chair by the cooking stove, looked silly, and seemed disposed to address himself to slumber, his usual resort when inebriated.

Mrs. Scroggins was mad at first, for it was only the day before, that Jim for the hundredth time, had promised never to drink another drop, not even in a case of sickness.

But what was the use of getting mad with such a poor, silly imbecile thing as he was at that moment. He was not in a condition to appreciate a regular matrimonial blow up, and she wisely resolved to reserve the vials of her wrath, to be poured out at a more convenient season.

She looked at him and thought of losing the little place—of penury, degradation and the poor house. A lucky thought arose, like the Phœnix from the flames, out of the contemplation of the dark picture; and after a few moments deliberation, she put on her bonnet and cloak, and hurried over to the village not half a mile distant.

For a week previous a young daguerreotypist, with a portable saloon—a kind of overgrown omnibus—had been delighting the villagers by giving them the semblance of their faces, at prices varying from nine shillings to three dollars a head, depending on the value of the case.

All the people in the town had been daguerreotyped, and the omnibus man was the most popular person in the village. All the dames and maidens had been taken, and every Jonathan and Johial who could boast of a Susan, a Ruth, or a Sally, was taken, with her by his side in the picture, his arm thrown lovingly around her neck, and looking unutterably affectionate.

But Mrs. Scroggins was not sentimental; she had gotten over all that long before Jim took to drinking. She proposed to put the skill of the daguerreotypist to a more practical use than that of getting the good will of a lover.

She entered the saloon, and though her heart did beat a little at the degradation of exposing her domestic, matters to an entire stranger, she demeaned herself with all the firmness becoming the trying occasion.

Fortunately for her all the people in town had "been taken," and it was a dry time with the artist. In as few words as possible she stated the case to him, and the young gentleman readily promised co-operation.

Taking his apparatus under his arm, he accompanied Mrs. Scroggins to the cottage where Jim was sleeping off the effects of the villainous New England.

The inebriate sat in precisely the same position in which his wife had left him. He was asleep in a high-backed chair, which kept his head up, so that every thing was favorable to the sitting.

In a trice Jim Scroggins' old hat, ragged clothes, long beard, dozing, drunken expression, and all, was transferred to the plate.

But the picture did not suit the artist; he thought one taken when the sitter was awake would be a more correct representation.—Mrs. Scroggins thought so too, and when the dagurrootypist had put in a new plate, she waked him up.

"What d'ye want?" asked Jim, with a yawn.

"Wake up!" and the lady gave him a smart pinch, which opened his eyes, giving out the true expression of the drunkard.

The artist was prompt and in an instant edition second of Jim Scroggins was on the plate.

The original, not being required for further use, was suffered to sink away and complete his nap.

The pictures were put into a frame, and Mrs. Scroggins produced her money.

"Nothing, ma'am, I shall not charge you anything."

"But, sir, I am able to pay."

The artist shook his head, resolutely refusing to touch her money. Of course Mrs. Scroggins was grateful, and gave the artist an invitation to take tea with her, which he accepted. In the course of the meal the daugerreotypist told the story of his own life—how he had been brought up in the midst of intemperance, and knew all about it. His father had died a drunkard, and leaving his mother penniless, he had supported her from the profits of his portable saloon. Mrs. Scroggins of course sympathized with the young man and readily understood why he would not take pay for the pictures.

But what was better than all, the young artist took quite a fancy to Jim's only daughter, a pretty girl of eighteen; and, after tea, insisted on taking her daguerreotype. And the sly rogue pretended that the first was not a good one, and took another—one of which he took away with him.

The tea things were cleared away, and when he did go the poor girl's heart followed him, and half the night she laid awake to think of him.

### CHAPTER III.

Jim Scroggins recovered from his debauch, but the first thing he saw when he came into the kitchen in the morning, was two daguerreotypes which lay upon the table.

He picked up one of them, and started back in confusion, when he recognized his own distorted features.

He examined the other. It was the countenance of the first, with eyes open, and looking ten times more hideous than the sleeping picture.

"Good gracious!" exclaimed he; "did I ever look so infernal homely as that?" and he proceeded to scrutinize the picture a second time.

"Blame me! if I thought I ever looked so confounded mean as that, I'd go down and jump into the river."

"I have seen them though that looked just like that are," continued he; "but them was drunkards; now I ain't a drunkard, though I sometimes get a little sizzled. I never lit my pipe at the pump, though. Howsomever, them was taken for me, tho' when or where I have no kind o' notion.—There's the old hat, and there's the old coat—no mistake."

The footsteps of his wife caused him to drop the pictures, and he hastened out of the house to avoid the tempest which he thought his wickedness would call down upon his head.

It is a notable fact that he omitted his morning dram on this occasion, and his wife took courage. Like a prudent woman, as she was, she did not say a word about the occurrences of yesterday, and permitted him to eat his breakfast in peace.

He got through the day without drinking a drop, but on the following day the old appetite clamored for the usual dram, and in the afternoon, while his wife was in the sitting-room, he went to the closet where he kept the bottle.

But the first thing that met his gaze was the two daguerreotypes, resting against his black bottle. There was Jim Scroggins, drunk—asleep; and Jim Scroggins, drunk—awake.

"Them darn'd dogartypes!" muttered he, starting back in confusion at the miserable looking object they faithfully shadowed to him.

Jim stopped to think. He fully resolved never again to be the loathsome being they represented him to be. Taking the black bottle, he went to the door with it, and with right good will hurled it on the door-stone, where it was dashed into a thousand fragments, and the delectable stuff irretrievably lost.

"Hallo, what are you about?" said a young man just entering the yard.

"Smashing my rum bottle," said Jim with admirable coolness.

"You are the dogtype man, ain't you," said Jim.

"I am."

"Walk in, if you please," said Jim, ushering Mr. Shadow into the sitting-room where his wife and daughter were.

"Wife," said he, "you had them picters taken."

"I did, James."

"I've broke the bottle, and as to looking like them things again, I never will."

"Thank God! James; I hope you never will."

"Here is the pledge," said Mr. Shadow, who was a temperance man in practice as well as in principle.

"I'll sign it, by Mighty!" and Jim *did* sign it.

"Now, wife, will you rub them things out."

"Certainly, James," and Mrs. S. went for the pictures.

"And now," said the young man, "Mr. Scroggins, if you will walk over to my saloon, I shall be happy to take the real man, as God made him."

"I'll do it; and Betsey you shall come, too, and Susy."

Susy went with her father and mother, though her picture had been taken. On the way, Mr. Shadow walked by her side, and said a great many silly things.

The daguerreotypes were taken, and Jim was surprised to see the difference between the picture of a drunken man and that of a sober one.

He drank no more liquor, and though this incident happened three years ago, he is still a sober, reputable man in the village. The little place is all paid for, and Mrs. S. is superlatively happy.

Susan, in less than a year, became the wife of Mr. Shadow, who, notwithstanding his name, is a man of substance, and loves his wife all the more because he was instrumental in saving her from the degredation of being a drunkard's daughter.

## THE DUCHESS OF SUTHERLAND.

Our readers ask who is the Duchess of Sutherland? She is a handsome woman, and is in tolerable preservation at the age of fifty. She has been a grandmother several years—having married off her daughters, all of them handsome and healthy, at early ages. She was mistress of the Robes to Queen Victoria for several years, and is her personal friend. The Duke of Sutherland is nearly twenty years her senior—a tall, thin, silent man, with light hair and sandy whiskers, and much different from his younger brother, the Earl of Ellesmere, who is dark complexioned and well-looking.—The Duchess of Sutherland is one of the Earl of Carlisle's sisters. He visited the United States ten or twelve years ago, when he was Lord Morpeth. It is very odd that he, and all the male members of his family, should be extremely plain in features, while the females have been noted for their beauty. Earl Carlisle's grandfather was a poet and a playwright. In "English Bards and Scotch Reviewers" mention was made of "The paralytic bulings of Carlisle;" and, some years later, Byron (who was his cousin and ward, and hated him) wrote a severe epigram, which may not have got into print on this side of the water. Carlisle, on one and the same day, had subscribed a thousand pounds to some charity, and published a sixpenny pamphlet. Byron thus commemorated the double event:—

"Carlisle subscribes a thousand pound
Out of his rich domains,
And for a sixpence circles round
The product of his brains.
'Tis thus the difference you may hit,
Between his money and his wit."

What he Wanted.—"Doctaw doctaw," said an exquisite, the other day. "I want you to tell me what to put into my head to make it right."

"It wants nothing but brains," said the physician.

## SONNET TO SUMMER.

O balmy, breezy, beauteous, bounteous Summer!
To men and women, little girls and boys,
To birds and beasts, thou bringest many joys,
And art indeed a truly welcome comer!
Now stroll in pastures green, fat sheep and cows,
Now vernal blades prepare for Autumn sheaves.
And woods (tho' stationary) take their leaves,
And all politely make their prettiest boughs!
Now the blithe Farmer in the early morn
With sturdy step strides o'er the fallow field,
And plants, in hope that, tho' a while concealed,
The grateful Harvest may "confess the corn,"
And so return him from the fruitful mould,
His gift augmented by a hundred fold!

[*Burlington Sentinel.*

Bluffing a Witness.—"Mr. ———, you have a son who is an idiot, have you not?"

"Yes sir."

"Does he know anything?"

"Very little."

"How *much* does he know?"

"Well, almost nothing; not much more than *you* do."

The witness was allowed to retire without further question, amidst the most uproarious screams of laughter.

What do You Think.—A young buck of the soaplock order who wore an unshaven face, because as he said, it "looked foreign," lately accosted a Yankee as follows:

"I say fellow, some individuals think I am a Frenchman, and some take me for an Etalyean—now, what do you think I am?"

"I think you are a *darned fool!*" replied Jonathan.

# Youth's Corner.

"Attempt the end, and never stand to doubt;
Nothing's so hard, but search will find it out."

For the Rural New-Yorker.

## GEOGRAPHICAL ENIGMA.

I am composed of 20 letters.
My 1, 14, 19, 9, 7 is a country in Africa.
My 2, 5, 9, 19, 17, 15 is an island on the coast of Asia.
My 3, 6, 15, 5 is a famous volcano in Italy.
My 4, 17, 20, 16, 9, 10, 3 is a country in Spain.
My 5, 15, 2, 17, 11, 6 is one of the German States.
My 6, 13, 12, 7, 8 is a country in Asia.
My 7, 17, 10, 6 is a lake in California.
My 8, 3, 12, 16, 20, 4, 2, 5, 1, 8, 17 is a peninsula in Asia.
My 9, 4, 13, 15, 18, 14, 12 is a country in Asia Minor.
My 10, 5, 7, 20, 17 is a far off city.
My 11, 13, 14, 18, 20, 9, 5, 15, 17 is one of the United States.
My 12, 5, 12, 12, 13, 1, 2 is a cave in one of the Southern States.
My 13, 15, 18, 13, 19 is an eastern river.
My 14, 16, 9, 4, 17 is a city in the State of New York.
My 15, 17, 19, 1, 14, 4, 8, 3, 1 is an island in the Atlantic Ocean.
My 16, 9, 16, 9, 4, 5, 4, 5 is a lake in South America.
My 17, 19, 15 is a cape on the Atlantic coast.
My 18, 7, 11, 5 is an Island on the coast of Ireland.
My 9, 10, 3 is a river in Egypt.
My 20, 5, 11, 13, 19, 9, 4, 5 is a gulf on the coast of Europe.
My whole is a range of mountains in North America. Pennie.

North Bergen, N. Y., 1853.

## MISCELLANEOUS ENIGMA.

I am composed of 29 letters.
My 1, 2, 4 is a domestic animal.
My 3, 8, 5, 9 is a delicious fruit.
My 10, 11, 12, 24 is an article of food.
My 13, 6, 7 we never should commit.
My 3, 22, 29, 21, 23, 29 is a distinguished personage.
My 26, 27, 25 is a strong drink.
My 14, 17, 6, 14, 13, 15, 9, 13 are used by the ladies.
My 18, 3, 8 is a mischievous animal.
My 4, 20, 3 is a child's toy.
My 17, 18, 28, 4 children should never say.
My 12, 20, 21, 16 is a kind of grain.
My 3, 19, 5, 4, 8 is used in eating.
My whole is, perhaps, the most important invention of the age. S. K. Whiting.

East Winthrop, Maine, June, 1853.

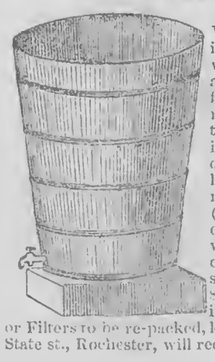
## ANSWER TO ENIGMA, &c., IN NO. 25.

Answer to Geographical Enigma—*The Washington Monument.*

### RAIN-WATER FILTERS.



THE use of Filtered Rain-Water, for drinking and cooking purposes, has more to do with health, than most persons are aware. Hundreds of the first families in this city have used the Filter from one to fourteen years, with the highest satisfaction, and the demand increases, as their worth becomes known. As an article of luxury, aside from health, no family (living in lime stone sections of country,) ought to dispense with their immediate use. They can be safely forwarded to any section of country. Price, 5, 6, 8, and 10 dollars, each, according to size. Orders for Filters or Filters to be re-packed, left at J. Packard's watch shop, State st., Rochester, will receive immediate attention.

JOHN KEDZIE.

Rochester, N. Y., June, 1853.

### Imported Horse, "Consternation,"

WILL stand this season at the farm of the subscriber, two miles west of Syracuse and adjoining the village of Geddes. His colts and fillies are already in demand for breeding. Several have been sold durmgthe past winter, at handsome prices, to go out of the State.

Terms.—$10 for the season, and $15 to insure; the money to be paid in advance in all cases. When a mare is insured and left at the farm of the subscriber, or regularly returned to the horse until the groom is satisfied she is in foal, a receipt will be given promising to refund the money if the mare was not got in foal. Pasturage furnished at three shillings per week. Mares to be at the risk of owners in all respects. J. B. BURNETT,

May 14. [177-tf] Syracuse, N. Y.

### GARDEN AND FIELD SEEDS

*From the New Establishment of Van Zandt & Bowdish,*
No. 114 State street, Rochester, N. Y.

CAN be purchased of the merchants generally throughout the country, in Papers or Packages, on the most reasonable terms. Also at the Agricultural Warehouse of E. D. Hallock, No. 24 Exchange street, near the Clinton Hotel, Rochester, N. Y.

The Seeds from this establishment can be relied on as being of the very best quality. They are mostly imported, or grown by the Eastern Shakers, and are warranted.—Full directions for cultivation printed on each Paper and Package. VAN ZANDT & BOWDISH.

Rochester, N. Y., 1853. 170m6.

### FERTILIZERS.

PERUVIAN GUANO,.....$45 per ton.
Super Phosphate of Lime,.....2¼ cents per pound.
Bone Sawings, or Meal,.....$2,50 per barrel.
Turnings and Crushed,..... 2,25 " "
Pulverized Charcoal,..... 1,00 " "
Plaster, Ground,..... 1,12½ to 1,25 do.
Potash Scrapings,.....3½ to 4 cts. per lb.
Sulphuric Acid,.....2¼ to 2½c. "

For sale at the State Agricultural Warehouse.
LONGETT & GRIFFING,
178w8. No. 25 Cliff Street, New York.

### GENESEE PAPER MILLS.

CO-PARTNERSHIP NOTICE.—The subscribers having purchased the Genesee Paper Mills property, have this day formed a Co-partnership, under the name and firm of Adams, Huntington & Co., for the purpose of Manufacturing Printing Paper, and dealing at wholesale and retail in all kinds of Paper Stock. Office and Warehouse, No. 93 State street.

FRANCIS T. ADAMS, E. T. HUNTINGTON,
WILLIAM A. ADAMS, ALVAH STRONG,
ALBERT M. HASTINGS, D. D. T. MOORE.

Rochester, April 15, 1853.

### MARSHALL'S BOOK BINDERY,

BURNS' BLOCK corner of State and Buffalo street, over Sage & Brother's Bookstore, Rochester, N. Y.

Music Books, Pamphlets, Periodicals, &c., bound in plain and fancy bindings; old books rebound; Blank Books ruled to any pattern, and bound to order; Public and Private Libraries repaired at short notice. Packages containing directions for binding, punctually attended to.

N. B.—All work warranted, and done at low prices.

April, 1852. [122tf] F. H. MARSHALL.

### GREAT PRIZE MEDAL.

THE WORLD'S FAIR AT LONDON, awarded us a Mammoth Silver Medal for the Best Hats.—Gents wishing the Spring and Summer style, will call. We are prepared to serve you with a superior article, and of the most becoming style.

CLARK & GILMAN, 23 State St.,
[169-3m.] Rochester N. Y.

### Important to Farmers
### PORTABLE MILL.

[From the Ohio Farmer, December 2, 1852.]

ROSS' Improved Patent Conical Burr Mill Stones.—Our readers will many of them remember that Ross' Portable Burr Stone Mill took the First Premium at the Annual State Fair, held in this city a few weeks since.—This admirable invention must commend itself to every one who has witnessed its operation. In the first place it is easily portable, simple in structure, does not easily get out of order, and does its work with great rapidity and perfection. It may be used for grinding the coarsest food for cattle, or the finest meal for family use. It is also well adapted for grinding wheat, rye or buckwheat. It is indeed a perfect grist mill in miniature, and we would advise every farmer, if possible, to procure one. The expense of one of these mills, with the apparatus for horse power, can not be very great; or a number of farmers might club together and procure one, which would be sufficient for all.

Mr. Ross is, we believe, a resident of Rochester, N. Y.

N. B.—Any further information relative to the Conical Mill can be obtained by letter, post-paid, or by calling at the factory of CHARLES ROSS,
2d story Phenix Building, Aqueduct-st.,
154-tf opposite the Arcade, Rochester, N. Y.

### MOORE'S RURAL NEW-YORKER:

A WEEKLY HOME JOURNAL,

## For both Country and Town Residents.

PUBLICATION OFFICE,

Burns' Block, corner State and Buffalo Sts., Rochester, N. Y.

### TERMS, IN ADVANCE:

Two Dollars a Year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

### Terms of Advertising

One Dollar per square (ten lines—100 words, or less,) for each insertion,—*in advance.* ☞ The circulation of the New-Yorker is much larger than that of any other newspaper published in the State, out of New York city. Only a limited space, however, is devoted to advertisements, and hence preference is given to those most appropriate—such as the cards and notices of dealers in Agricultural Implements and Machinery,—Horticulturists and Seedsmen,—Booksellers and Publishers,—Inventors, etc. All orders by mail should be accompanied with the cash.

To enable us to accommodate as many as possible, brief advertisements are preferred. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

### THE WOOL GROWER AND STOCK REGISTER.

This Is the only American Journal primarily devoted to the interest of Wool and Stock Growers, and should be in the hands of *every owner of Domestic Animals.* It is ably conducted, published in the best style, and finely illustrated. Each number contains a careful Review of the Wool and Cattle Markets, and much other *useful* and *reliable* information which can be obtained from no other source. The Fifth Volume commences with July, 1853.

Terms:—Fifty Cents a Year; Five Copies for $2; Eight for $3; Eleven for $4. Back volumes, bound in paper, at 40 cts. each,—unbound at 35 cts., or three for $1.

Published monthly, in octavo form. Specimen numbers sent free. Money, properly enclosed, at our risk.

Address D. D. T. MOORE, Rochester, N. Y.

# MOORE'S RURAL NEW-YORKER.

VOLUME IV. NO. 27. ROCHESTER, N. Y.—SATURDAY, JULY 2, 1853. WHOLE NO. 183.

MOORE'S RURAL NEW-YORKER:
A QUARTO WEEKLY
Agricultural, Literary and Family Newspaper

CONDUCTED BY D. D. T. MOORE,
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter—interspersed with many appropriate and handsome engravings—than any other paper published in this Country.

☞ FOR TERMS, &c., see last page.

## Rural New-Yorker.

### Progress and Improvement.

## HAY.—CUTTING AND CURING.

THE hay-makers are at work and the summer air is full of the fragrance of the new-mown grass. The farmers are early and late afield, and the season is one of bustling activity to them, their wives and children. O, there is work to do in the country about these days,—days when the denizens of the city think most of their country relatives, and oftenest go out among them. Let them not forget how busy their farming friends must be.

In what stage of the growth of grass it shall be cut, and the manner in which it shall be cured, are questions of considerable importance to the farmer, though as yet, no decisions in which all acquiesce, have made any one practice the uniform and general one. Some cut in the season of flowering, before the blossoms have fallen, others not until the seed has formed, and others defer the operation until it is fully ripe. Each class bring arguments to sustain their plan of procedure, as also is the case in relation to the several modes of curing. We will state now, some facts relative to both subjects—drawn from chemistry and practical analogy—but bearing more particularly in favor of early cutting and shade curing, which is conceded, by many of our best farmers, to secure the greatest nutritive value of the hay.

Chemistry shows us that all plants contain the largest amount of matter soluble in water, at the period of flowering, and that the sugar and gluten of the grass, and a few other soluble ingredients, constitute its chief value as food for animals. These rapidly dimish as the seed forms, changing into insoluble woody fibre, and the hay which should, as far as may be, resemble grass in its most perfect state, is worth much less if not made until after that period.—There are but few exceptions to this rule, but we believe the Kentucky blue grass, the June grass, and some others which furnish but a light amount of stem, and are most valuable from their leaves which continue growing through the summer, may stand far past the flowering stage beneficially. It has been supposed, because ripe hay yielded the greatest amount of extract when boiled, that therefore it must contain most nutriment, but it is now found that the boiling very imperfectly imitates the process of digestion, and both analysis, and experiment with the living animal, confirm the fact that the best hay is that cut and properly cured when nearest the period of blossoming.

That process of curing which shall most perfectly retain the nutritive properties present in the plant, is the best process. In drying herbs for medicinal and culinary uses, the experience of many centuries teaches, that drying in the shade is the only way to accomplish the desired object. In making hay this cannot be entirely accomplished, but the plan which most closely follows it, that of curing in the swath and cock, is a good and safe one—advantageous also, as requiring less exposure to injury from rain than any other.

Clover hay and coarse herds-grass especially, need to be cured in this way, as they will not bear much handling when dry without loss of leaves and blossems. When mowed, let the grass get fairly wilted and the external moisture dried off while in the swath, with, perhaps, a single thorough shaking-up and spreading, and then be put into cocks, and it may be cured with very little loss. The partial fermentation, or "sweating," which it undergoes, causes but slight change in its constituent parts—save that it separates the water therefrom—and after standing thus for twenty-hours, it needs but little after tending, to prepare it for the mow or stacks, and has far less of that harsh and strawy tendency than it would possess if cured in a different manner. Care should be exercised in curing this way, not to put up the hay before it is fully wilted, and that the cocks be small and well-constructed, so that the "sweating" process may not be carried to excess, and induce so great a fermentation as to decompose the sugar of the hay, changing it to alcohol and carbonic acid.

The weather has a great influence on the real value of the hay crop, but that we can neither foresee nor control. If the weather should prove unfavorable, and constantly changing, it is thought that the less the hay is stirred the better—that it will retain its value while lying wet in the swath, much longer than if disturbed with repeated dryings and wettings. Nothing so injures hay as washing by rain, and this, if many times repeated, will totally destroy its value as food for animals.

In cutting grass, good tools and good workmen are essential to the economical performance of the work. There is more of ease as well as completeness with the good workman, in the performance of his labors, and good tools are also a great aid in these respects. Order and readiness in the whole round of preparations give largely increased facilities for pushing forward this and all other farm operations. It is important to have ample means to do everything as and when it should be, since so much depends on the right curing and securing of the hay crop. The introduction of mowing machines and other labor-saving implements is of much importance to the farmer, rendering him independent, in some degree, of manual labor, often difficult to be secured, and always dear at this season of the year. With the requisite team, a good mowing machine and horse-rakes, the usual number of laborers employed on the farm will sooner secure in good order, an hundred acres of meadow than they could a dozen under the old system.

## CULTURE OF INDIAN CORN.

EDS. RURAL:—The increasing facilities of transportation, by canal and railroads, are every year enhancing the value of the corn crop to western farmers; and any information that will tend to increase the yield per acre should be sent broadcast among them. My early instruction in raising the crop was on the old system. After the land was plowed it was then thrown into ridges, the planting was across the ridges, and the hills on the top of them. The finishing of the after culture was, to form the surface into hills around the corn.

Some fifteen years since I first obtained from the Albany Cultivator the idea of keeping a level surface in cultivating the crop. Its advantages were set forth with so much clearness, that I was induced to investigate and adopt it; and after giving it a trial that length of time, I am satisfied that more bushels of corn can be raised from an acre, with a level surface, than there can by the old system. But there was a difficulty to encounter at that time. My workmen chose to adhere to the old system, and would bring their arguments in its favor. And they must be met with fairness, yet I seldom failed to convince the most skeptical on the subject. The following facts were the most convincing. The time of hilling corn was generally when the most forward stalks began to show the ends of the tassels. I would select where there was four good hills standing; in the center between them I would dig down to the subsoil, then work under towards the best hill. The ends of the side or branching roots at that time were from three to four inches below the surface of the ground; to hill the corn would require two inches of soil between the hills, to be placed around the corn, where but a few roots had the benefit of it. And the ends of the roots that took up moisture and nutriment for the stalks were brought from an inch to two inches below the surface of the ground between the hills, which rendered them nearly useless in taking up nutriment for the stalks in dry weather.

Again.—When the corn was cut up, there was another objection,—the stalks were leaning more in every direction. But the long and well filled ears explained why the stalks bent beneath their load, and amply paid for extra labor on that account.

I have seen corn in a neighboring field plowed out both ways, and then good hills formed around the corn, but the roots were severed so much by the plow, and uncovered in forming hills, that it did not recover from the operation in a week's time.

Several times I managed to have grass succeed corn; and grass seed has succeeded as well with corn as with small grain. I sow four quarts of timothy and four quarts of clover per acre; then pass both ways with the cultivator, following with the hoe, laboring to leave the surface level. And if it is intended for meadow the corn was cut close to the ground with a sharp hoe, having a handle about eighteen inches in length.—Such meadow has yielded me two tons of hay the first clip, though the grass crop would be some later than early seeding.

ALVIN WILCOX.

West Bloomfield, N. Y., June, 1853.

## CHANGES IN CLIMATE.—NO. V.

HIGHLY stimulating manures and fertilizers are injurious to the potato crop, because they induce a too rapid growth, and consequently, a too *tender* state of the plant.—Northern slopes and aspects, and shades of high forest trees on the south side of the patch, serve to prevent the disease. Planting in alternate rows, (east and west,) with Indian corn, is useful, as the corn generally shades the plants and ground, and prevents the great accumulation of heat from the rays of the sun. After all, however, is done that can be, it will probably be impossible always to prevent the "rot" inasmuch as it is impossible, by human exertion, to prevent the recurrence of the increased degree of heat from the causes before mentioned. Of course, until cooler seasons occur, we shall be, more or less, troubled with the "potato rot."

As with the potato plant, in regard to the "rot," so with the wheat plant in regard to "rust." The increase of heat has, within the last twenty-five or thirty years, frequently caused an overgrowth of the stalks and leaves; and of course a superabundance of sap, distending the sap vessels to their utmost capacity. Severe and long continued heat ruptures the distended sap vessels, by swelling the juices contained in them, in the same manner, and for the same reason, that the water in a *full* tea-kettle swells, lifts the lid, and runs over, when heat is applied to make it boil. The sap runs out of the ruptured vessels, and dries on the surface of the straws and leaves; frequently assuming all varieties of shapes, like the scoria from a volcano. This is the *secret*, so frequently (and, I might almost say diligently,) overlooked by our "microscopic" philosophers, who, "overstepping the modesty of nature," charge the evil upon the poor innocent family of the "*Fungi*," which never attempts to appropriate to itself the *living matter* of other plants, but patiently waits until they have cast it aside, as *dead*, and unfit for their further use. Early winter varieties, and early sowing are the best preventives. If sown too early, however, the crop is liable to be destroyed by the "Hessian fly," by impregnation in the fall. If very late sown, its growth is retarded, the straw obtains a superfluous quantity of sap, and it is very liable to be rusted. Sowing plaster on wheat, generally has a bad effect by causing the straw to grow too large, and rank; thereby rendering it peculiarly susceptible of injury by rust.

The rye crop too has frequently failed for some years past; and it is believed to have been in consequence of the increase of heat. In some instances the late sown rye has been "spurred" to the amount of about half of the crop. Probably the excessive heat ruptured some of the sap vessels of the head, from which the sap run out and the "ergot" was formed in the same manner that smut on cornstalks is. Of the latter, some very singular instances of the formation of the smut have come under my observation. And a critical examination of them has proved conclusively, to my mind, that superabundant heat was the cause. In one instance, in a patch some two rods wide (N and S) nearly all the stalks in the southern row were smutted, in one part or another; while on those in the northernmost row, the smut balls were "few and far between." From the southern side of the patch, the smut was in diminished quantity towards the northern row, in which very little was found. The effect appeared to have been produced by the greater degree of heat, operating upon the more exposed southern side of the patch; the interior and northern rows being more shaded than those upon the south side.

In conclusion, I would advise that every practical farmer should closely and critically observe, and, *if possible*, learn the *cause of every effect*. Without *positively knowing the cause*, attempts at prevention must be mere "*guess work*." And although it is said that "guess work is best when it hits right," as it does not always "hit right" it is not advisable to try the experiment, when other, more certain means can be found, at the expense of but little time and trouble.

'HIEL.

Seneca County, N. Y., June, 1853.

## ABOUT FALLOWING, MANURING, AND KILLING THISTLES.

EDS. RURAL:—I desire to be permitted to say a few words to R. S., Baldwinsville, on the subject of fallowing, manuring, and particularly on killing thistles. R. S. will go on to summer fallow, to his satisfaction. I would not fallow at all, considering it much labor, injurious to the land, and no profit. I will simply state my own experience for three years past.

I put all my manure in the spring on my corn ground, and try to get my corn where my *thistles* are, spreading it as I plow. Within a week after my corn is dressed for the last time, I take a spade, or as many spades as I have men to work them, and go at them, (am sure to be there myself.) Each takes a spade between the rows, and passes to and frow through a patch, taking every thistle out, root and branch, that the spade will fetch up. Shake off the dirt, and throw them on the ground passed over; and let the weather be moist or dry, the first few hours sun will kill them dead. When this is once done, the whole work is then at least half done. I then follow them up, at intervals of a week or ten days, in the same way until the corn is off the ground, or until all the thistles in the field could be put into a snuff box. They must not be suffered to get far above ground,—must not be neglected. This work may be done by catching half hours, or in wet weather, when plowing them would do little good.

The above mode is death on all thistles, and in my estimation not more than one-third the expense of plowing them out, for that, to be efficient, must be done with men and team, in hot, dry weather, when every farmer has enough to do. After corn, put barley or oats, then wheat and clover; plow but once for either. Manuring, as above, is less labor, and you get the whole benefit of it. In its decomposition it is in and mixed with the soil, and its *effects* in a succession of crops, are more beneficial than in any other way.

J. H.

Henrietta, N. Y., June, 1853.

## CONDENSED CORRESPONDENCE.

### Wisconsin.—Its Soil, Timber, &c.

EDS. RURAL:—Columbia Co., Wis., lies about west of Rochester, N. Y., or a little north, perhaps, and a description of this county will give a fair idea of the whole State; except the northern "Pinery" and the timbered portion in the east. The face of the country is rolling—the southern more level than the north-western, which is quite hilly.

The prairies of this State, though not as large, are more rolling than those of Illinois. If your readers wish to form a correct idea of a prairie, let them imagine how some of your towns would look if all the trees, all the houses, fences, roads, &c., were brushed away, at one sweep, and in their places should remain a beautiful grassy meadow, bespangled with innumerable flowers; and they will have an open, uncultivated prairie. Imagine your orchards replaced irregularly, and you have a prairie with groves—replace your other improvements, and you will have a cultivated prairie with small groves. The "oak openings" resemble a scrubby, untrimmed orchard, the trees placed very irregularly.

In this section we have no heavy timber except along the streams, though there is generally enough for fencing and fuel. The kinds of timber, in the openings, are black, white, and burr oaks; in the groves, the several varieties of oak, with shag-bark walnut, aspen or poplar, and cherry. Along the streams, grow soft and hard maple, ash, elm, oak, &c. In the eastern and northern parts, pine, hemlock, beech, &c., are abundant. The marshes, unlike those of most other States, are formed by springs of pure cold water—the water gradually draining off into creeks, rendering them more healthy; and they are bountifully covered with wild grass, for the support of cattle during the winter.

The soil of the prairies is a black, vegetable mould, intermixed more or less with sand, and producing most of the cereals, roots, and English grapes, in great abundance. Winter wheat grows finely, but the bleak winds of winter blow the light soil from the roots, leaving them exposed to the weather, and the numerous freezings and thawings of winter and early spring, generally make "a finish of it." In protected situations it does well. The soil of the openings is of a more varied character.—The white oak soil is generally a sandy or clayey loam. The black and burr oak soil unites often the vegetable mould, loam, sand, clay and gravel. The openings are equal to the prairies for all kinds of grain, and much surer for winter wheat; the soil being heavier and more protected.

The soil and climate appear adapted to all kinds of fruit of a northern climate, except peaches. The peach tree grows finely, and occasionally bears, but the sudden and severe "cold snaps" of winter, kill them down, even after they attain to four or six inches in diameter.—F. G. R., *Courtland, Columbia Co., Wis.*, June, 1853.

### "The Old Oaken Bucket,"

EXCEPT in the "fond recollection" of the "oldest inhabitant," is now seldom found. The pump has taken its place; and whoever would keep up with the improvements (!) in that article, must have a new one every year,—and in fact that is longer than many of them continue to work well. But if they do not pump the water from the well, they are always sure to pump the money from the pocket; and whether a quantity of wood and metal lying in the well, injuriously affects the water, is of course a matter of *taste*. But to fill up and throw by a well of pure cold water, as has been often done, merely because there is a spring that will run *up* to the house, is too bad. It is not designed to speak against the improvements for conveying water thro' pipes, for water thus conveyed is, for most uses, just as good. But for *drinking*, the next best thing to water taken from a good spring *at the fountain*, is that taken by a

*bucket* from a good well,—and wo would say to all who have such, get all the other accommodations you please, but spare the well.

But this article was commenced for the purpose of stating my method of drawing water. And I would say that I have so far conformed to the *spirit* of the present age as to dispense with the "Old Oaken Bucket," the "iron bound bucket" weighing some fifteen pounds, and use one made of *tin*, weighing about two and a half pounds. A small child can draw a bucket of water,—in fact one not large enough to bring more than half of it to the house. The expense may be summed up as follows:

| | |
|---|---|
| One tin bucket | $0 50 |
| Rope, with short chain attached | 0.50 |
| Timber for curb and windlass | 0,40 |
| Nails | 0,05 |
| One day's work | 1,00 |
| Repairs during the nine years the above has been in use | 0,00 |
| | $2,45 |

When not in use, the bucket should be laid bottom upwards on the windlass, to prevent rusting.—C., *New Lisbon*, June, 1853.

### Dog-keeping Newspaper-borrowers.—Again.

Mr. Moore:—Friend "Tim," of East Varick, is out with a "Plea for Dogs," in a late Rural. I say *friend*, because I judge he is a Temperance and "Higher Law" man, both of which I am. But he "demurs" at the proposal to "choke dogs with newspapers borrowed, or *lent*." I do not propose to enter into a controversy, but as his article furnishes the opportunity for a few more thoughts on the same subject, I embrace it.

Now, friend "Tim," *I* "demur" at your taking my *ultra* article as a text whereby you may whip these men who license men to sell rum, thereby making their fellow men "*mad*." Now, sir, a few words on this subject, as it is one of importance to the farmer for he is as a *tax-payer*—a social being—a father, perhaps—a lover of a "happy home." He is a temperance man—would sooner take a dose of *poison* than a dram of Rum! Yet is a *party* man—*must* "stick to party." An anti-temperance man is nominated by the party for Supervisor. He *must* be elected. Our farmer enlists in his support. He is elected—licenses are granted through the town—paupers are made—the farmer is taxed for their support. He complains of the increase of taxes, but does not for a moment seek to solve the mystery. Fellow farmer, are *you* paying a *Rum Tax?* Did *you* help *vote* one? Again, let me ask what is the penalty to be paid by the man who drinks rum—who is bitten by this "serpent of the still?" I answer, his Life! his hope of happiness, both in this life, and the life to come. God help men to see the danger, not only of drinking this deadly poison, but of sanctioning by their votes the giving it to others.

It is a very easy matter, "Tim," to *banish* these "dog-keeping newspaper-borrowers." The way I would suggest to banish them is, to kill, to annihilate the dogs, and then there would be no such "*class*" as the above named—"dog-keeping newspaper-borrowers." I admit there may have been many good dogs, but I venture to affirm, (and if any one will show me reliable statistics to the contrary, they will oblige me,) that ten lives have been destroyed by dogs where *one* has been saved;—*human* lives, I mean. Undoubtedly they were created for some benevolent purpose, but this fact does not prove, to *me* at least, that a man too poor to have the comforts, the *necessary* comforts of life, should keep a great bull dog, at an expense which would furnish material for the fattening of a good hog each year.

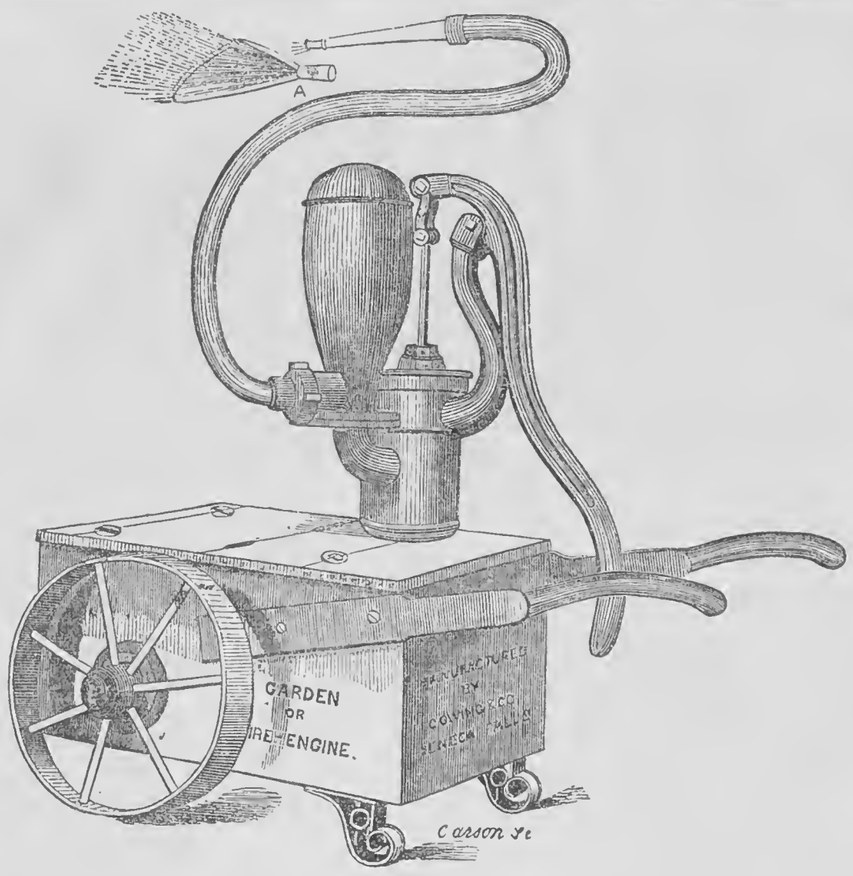
In my former article I had no personal references. They were *general—intended* so, at least, though I wished those hints might be applied *personally*. *Three* deaths occurred within my knowledge, in this county, last season, caused by the bite of rabid dogs,—and yet these animals are increasing at an alarming rate. Reader, the life of your neighbor, those of your family, and your own life is in danger! And what a horrible end!—Hydrophobia!

Charlie Chesnut.

### Staking and Capping Fence.

In the Rural of June 11th I noticed an article from the pen of S. Graves, of Marcellus, N. Y., recommending *his* "favorite method" of building rail fence. I would like to say to him that I have tried his "favorite method" and find it the least substantial of any style of rail fence. Let him put a dozen colts into a field surrounded by such a fence, and their coltish pranks will soon make apparent the inefficiency of his favorite method of locked riders,—whilst he may be engaged in endeavoring to make it apparent to *every experienced farmer* that his "favorite method" costs but half as much as staked and capped fence, besides the value of the land the stakes occupy.—Now, so far as my limited experience goes, I have not found any style of rail fence equal to that which is staked and capped at the corners. Besides, the extra cost is but trifling, to say nothing about the gratification its substantial and neat appearance afford, compared with his ragged fence.

But excuse this scribble, Mr. Editor, for I am more accustomed to staking and capping fence than writing to Editors. But I have one request to make through your paper. That is, if Mr. Graves will just come out here to our prairie land, I will warrant our prairie breezes will improve his style of fence, if not his "forensic eloquence."—E. Buell, *Prairie Ronde, Mich.*, June, 1853.



GARDEN OR FIRE ENGINE.

As the present is the time when gardens require particular attention and more moisture than is usually diffused from the clouds at this season, hints and suggestions to gardeners are in order. We therefore direct attention to the various articles and machines used for watering gardens. Of the latter the Garden or Fire Engine represented above, is one of the best machines before the public—as we can testify from personal knowledge of its construction and operation. All interested in the matter are referred to the advertisement of Coning & Co. of Seneca Falls, N. Y., in this paper.

## AGRICULTURAL INTELLIGENCE.

### Provincial Fair of Canada West.

The last number of the Toronto *Agriculturist* contains the Prize list of the Fall Exhibition of the Canadian Agricultural Fair, which is to be held at Hamilton on the 4th, 5th, 6th, and 7th of Oct. It is expected to be an occasion of great interest as an exposition of Industry and Products of the Province. The Hamilton *Spectator* remarks:—"From all that we can learn on the subject, there is every prospect of the coming exhibition far surpassing any previous, one both as regards the scale on which it is to be carried out, and the interest it is calculated to create. The funds for the purpose are considered ample; besides, our City Council is pledged in the sum of £500, the President of the Society offers prizes to the amount of £50, T. C. Street, Esq., M. P. P., a prize of £20; and also the Governor General a special prize of £20. The premium list is much larger than any previous one, and in some instances the old prizes have been increased. The premiums offered by the President are truly handsome, and we trust will be the means of creating much competition."

### Agricultural and Horticultural Societies.

"An Act to facilitate the forming of Agricultural and Horticultural Societies," has recently been passed by our Legislature.—It contains important and beneficial provisions, which will not only encourage the formation of such societies, but augment their influence and prosperity. Hon. T. C. Peters, Member of Assembly from Genesee County, (and one of the editors of the Wool Grower and Stock Register,) was the author of this law, and is entitled to whatever credit may be due therefor. The Act is as follows:

Section 1. Any ten or more persons of full age, citizens of the United States, and a majority of whom shall be citizens of this State, who shall desire to form a County, or Town Agricultural or Horticultural Society, in any county, town city or village in this State, may make, sign, and acknowledge before any officer authorized to take the acknowledgment of deeds in this State, and file in the office of the secretary of state, and also in the office of the county in which the business of such society is to be conducted, a certificate in writing wherein shall be stated the name and title whereby such society shall be known in law, the particular business and objects of such society, the number of trustees, directors or managers to manage the same, and the names of such trustees, directors, or managers thereof, for the first year of its existence.

2. Upon filing a certificate as aforesaid, the persons who shall have signed and acknowledged such certificate, and their associates and successors, shall thereupon by virtue of this act, be a body politic and corporate, by the name stated in such certificate, and by that name they and their successors shall and may have succession, and shall be persons in law capable of suing and being sued, and their successors may have and use a common seal, and the same may alter and change at pleasure, and they and their successors, by their corporate name, shall in law be capable of taking, receiving purchasing and holding real estate for the purposes of their incorporation, and for no other purpose, to an amount not exceeding the sum of twenty-five thousand dollars in value, if a county society, and ten thousand dollars in value, if a town, village or city society, and personal estate for like purposes to an amount not exceeding ten thousand dollars, if a county society, and three thousand dollars, if a town, village or city society, to make by-laws for the management of its affairs, not inconsistent with the laws of this State or of the United States.

3. Any person who shall pay into the treasury of said society annually, in such time and manner as the by-laws thereof shall direct, a sum of money not less than fifty cents, nor more than one dollar, shall be a stockholder therein, and entitled to all the privileges and immunities thereof.

4. The officers of said society shall consist of a president, and at least one vice president, a secretary, and treasurer, and at least one director or manager for each town in the county, if a county society, and not less than ten, if a town, village or city society. And they shall be elected annually by the stockholders of said society voting personally and by ballot, and said officers shall constitute a board for the management of the concerns of said society, a majority whereof shall be a quorum. And it shall be the duty of said officers to so manage the property and concerns of the said society as will best promote the interests of agriculture, horticulture, and the mechanic arts. And they shall hold annual fairs or exhibitions, distribute premiums to the best and most meritorious exhibitors in these several depsrtments.

5. There shall be but one county society in any one county in this state, nor shall there be more than one society in any town therein; but any two or three towns may join and organize a society for the same.

6. The said society may, in case the uses and convenience thereof so require, upon application to the supreme court of the district wherein said county at the time of such application shall be situated, obtain the requisite order and power to sell from time to time the whole or any part or parts of its real estate, the granting of such order to be in the direction of the court, and such application to be made only when authorized by said society at an annual meeting thereof by a vote of not less than two-thirds of the legal members of said society present at such meeting, and notice of the intention to vote for such application having been published in three of the newspapers printed in said county once a week for three months next preceding such annual meeting.

7. The officers of any society organized under the provisions of this act shall be jointly and severally liable for all debts due from said society contracted while they are officers thereof, provided said debts are payable in one year from the time they were contracted, and provided a suit for the collection of the same shall be brought within one year after the debt shall become due and payable.

8. The president, secretary, and treasurer of said society shall, annually, on or before the first day of February, make out and transmit to the secretary of the State Agricultural Society at Albany, a statement of the transactions of said society for the year, giving a full detail of the receipts and expenditures thereof, with a list of premiums awarded, and to whom, and for what purpose, and the same shall be subscribed and sworn to by said officers before some person authorized to take the acknowledgment of deeds, as being a just and true statement within the spirit, true intent and meaning of this act.

9 Every society formed under this act shall possess the powers and be subject to the provisions and restrictions contained in the third title of the eighteenth chapter of the first part of the revised statutes.

## THE AGRICULTURAL PRESS.

### Time of Harvesting Grain.

The following excellent article by a correspondedt of the *Germantown Telegraph*, is worth the particular attention of grain growers:

It would seem to be almost superfluous at this late day, to urge upon our farmers the importance of cutting grain before it becomes fully ripe: yet notwithstanding the numerous articles which have been written and published upon this subject, and the very decided convictions expressed by the most judicious millers and grain dealers in favor of early harvesting—especially where the grain is intended for bread making or flouring—there are many who still adhere to the old practice, and will by no means allow their crops to be harvested till the grain is fully ripe. Prejudice is a tyrannical master and no class of the community appear to be more fully under its sway than our own agricultural class. In New York, and indeed, in all the great wheat growing States, the practice of cutting the grain before it is dead ripe, prevails almost universally. The exact time when it should be harvested, is now, with the grain producing part of the community, no longer a matter of doubt or speculation; all being fully convinced that the right period is indicated by that change which the grain experiences when passing from its milk state to that of complete hardness, and when the kernels, without being "*sticky*," are yet not sufficiently hard to resist the pressure of the thumb and finger. The farina of the grain being perfected, all that is necessary to render it fit for flouring is the hardening of the mass; and this it is abundantly established, may be as well perfected after the straw is cut, as before. Beside, grain that is allowed to stand till it is fully or dead ripe, makes darker flour, and is not so heavy; it scatters in harvesting, and does not command, in our markets, so ready a sale, or so high a price. The straw of grain, when it is cut before the period of perfect maturity, is also much more valuable: it possesses a degree of succulence and saccharine sweetness which renders it a good feed for stock: a use to which the straw that has stood in the fields till it has become dead or perfectly matured, can never be applied.

I have cut oats when the straw was just turning from its golden hue, and have found the grain as plump and full, and far brighter in color, than that which has stood in the field till ripe. The straw of oats when harvested early, and properly cured, is nearly as valuable for cattle feeding as the best clover hay; and when chaffed and mixed with chopped roots or meal, it makes a feed eagerly partaken of by stock of every description.

### Good Tools for the Boys.

The editor of the Portland Pleasure Boat gives the public some excellent practical advice. In an article in which he furnishes some hints in regard to making agriculture a cheerful and agreeable occupation, he closes the subject thus:

Farmers, furnish your young boys with light, neat and good tools, and teach them how to keep them in good order, if you would have them love agriculture, and give them a little lot for their own use.

If you wish to discourage them and drive them off to the city, to sea, or to California give them rusty hoes, broken shovels, dull scythes, &c., to work with, and not allow them to plant a seed or a tree for themselves. Every boy on a farm should be allowed a lot on which to make a miniature farm. He may have a row of corn, a row of potatoes, a patch of wheat, oats, beans, grass, and if you keep animals give him a calf, a colt, or a lamb to raise.

With the products of his little farm he can supply himself with books, clothes, &c., so that you will be gainers by being liberal, and will encourage industry and beget a love for agriculture in your sons, which will in future years lead them on to perfection in the art, and place them among the highest of nature's noblemen.

Farming in California.—A correspondent of the Journal of Commerce thus writes about California farming and prices:

Twenty-five dollars per hundred pounds has just been offered for 1 000 head of beef cattle, to be delivered at Benicia in lots, at stated intervals between now and the 1st of January. The party tskes $30 and expects to get it. Potatoes have advanced to 15 cents per lb. by the quantity. Onions are selling at 45 and 50 cents per lb. What would your farmers say to getting three hundred dollars cash, for five ordinary sized gunny bags of onions? Our farmers are now busy in cutting and curing their grass, the crop of which is very abundant. The grain harvest will commence in about a fortnight, and continte for nearly three months.—Wheat, barley and oats promise an abundant crop.

### Bingham's Sheep Shearing.

We copy the following interesting account of this shearing from the *Wool Grower and Stock Register:*

Left Castleton Wednesday morning, June 1st, for Hyde's, in Sudbury, where the shearing was to take place. The road was as pleasant as I ever traveled for the same number of miles, about fifteen. It had all the variety of wood-land, hills, lakes, and mountains, and from some points the mountain ranges of Northern New York stretched off in magnificent perspective. Hyde's hotel is situated in one of the most beautiful valleys I ever saw. It is so retired, and yet there is so much of beauty around you, that I do not know of a more desirable locality for a man who wishes for relaxation from the bustle and cares of life to spend the hot summer months. Pure air, pure water, beautiful lakes, and magnificent scenery will meet him at every turn, but the busy, noisy world lies far beyond, and away.

The shearing had commenced when I arrived. The sheep shorn the first day were ewes of the French Merino breed, pure bloods, and mostly heavy, fat sheep. Their fleeces weighed very heavy. I did not keep a register, as one of the committee promised to furnish me with a copy, which has not yet, from some cause, been done. The wool was unwashed, had not been suffered to come to the weather, and had been well oiled, and was in most, if not every instance, the growth of more than one year. The wool was generally of a good grade, some quite fine, and from its great length and strength of staple a most desirable de laine wool. It would probably shrink in cleansing for the cards at least 60 per cent.—some even more than that. But even at that large deduction there would be a large clip of wool from some of the sheep. For the breed they were noble sheep, but not at all uniform in the appearance and quality of the wool, or of the sheep; some, to my fancy, worth double of others.

A band of music was in attendance, and often added their notes to the sharp click of the shears. There was a considerable sprinkling of Black Hawk horses and trotting sulkies on hand, and a very good turnout of people.

I staid that night with friend Saxton, at Orwell, and saw considerable of his stock, both sheep and cattle. His Devons beat anything that I have yet seen in this country, and I have seen most of the best herds. Of his sheep it is needless to speak, for I bought two rams of him, and consider myself fortunate in securing them. I hope to get one each from Mr. Remely, Mr. Campbell, and Mr. Cutting, though they may not be large enough to use much this year. The three year old ram I bought sheared this spring sixteen lbs. of unwashed wool of a good quality of full blood Merino. I do not believe, however, that the same sheep will shear as heavy fleeces, with the same keep, any where out of Vermont. By fair means I have not been able to produce the same weight, though equally well cared for. I think one reason is in the richness of their pastures and meadows.

The next day we returned to the shearing, and found a large increase to the numbers. To-day was shorn some of the largest, and one fleece I understand weighed about thirty pounds. I did not see the wool or the sheep weighed. After dinner, and all the sheep shorn, amounting to some eighty in the two days, the crowd gathered round the balcony on the north side of the house, and several speeches were made. I do not now remember the names of any except Deacon Greely, of Boston, Gen. Benedicts, I believe of Vermont, and Judge Keyes, of this State. Before each speech there was sung a verse, and that formed the text for the speaker. The speeches, considering the short notice, were very happy, and well received by the audience.

I left, well pleased with my journey, and am under very many obligations to Mr. Bingham for having furnished to me, as well as to many others, so delightful a holiday. I hope he will live to give many more equally interesting, and that I may be there to enjoy them. But I would respectfully suggest that it would be of much greater value and interest, if all the best flocks in the vicinity were represented at these shearings. I shall do all I can to get up an annual shearing club in Darien, and I think we can make a show that will pay a stranger for making something of a journey.

From what I have been able to see and hear in the two visits which I have now made to Vermont, the Black Hawk and the Morgan are the two best breeds of horses in the Union. That there is not one full blooded ewe to a thousand driven out of the State by sheep pedlars. That the sheep are light colored until they undergo the "Cornwall finish" process. That in some flocks valuable rams can be obtained at very high prices, but that very few are taken away by the sheep pedlars.—And that certificates of pedigree in their hands are subjects for serious reflection, at least. And last,—I can make up as good a flock of ewes in my own State as can be bought in Vermont. And that it's a very great mistake to suppose that good sheep can be found nowhere but in Vermont.

Mr. Campbell is so well pleased with his Silesian sheep that he is making another importation, and I have arranged for a ram of that importation. At another time I shall take occasion to speak of these sheep in connection with other breeds.

So much for the shearing.—P.

Fattening Sheep.—It is sometimes an object to fatten sheep rapidly in summer, and also to fatten off old sheep which cannot be readily fattened on pasture alone. In either case, good pasture and the feeding of a moderate quantity of grain daily, will generally effect it very advantageously. One bushel of grain fed to sheep in summer, will make as much fat as three or four fed in winter; hence they may be fattened off most rapidly, and with least expense, in summer and fall.—*Canjie'd.*

# Orchard and Garden.

## JUNE HORTICULTURAL EXHIBITION.

The Exhibition of the Genesee Valley Horticultural Society, of which we made a brief note last week, is deserving of a more extended notice. The exceeding dry, hot weather, which prevailed for more than a week previous to the day of exhibition, had so much affected the fruits and flowers that the show was not as creditable to the exhibitors as it would have been with the same effort, had the weather before and at the time of the exhibition been more propitious. As a whole it was not discreditable to the Society, but rather to the hundreds of our citizens who, as amateurs, might from their small collections have made, in the aggregate, an exhibition every way worthy of the exertions of the efficient officers and members of the Society, and one of which even Rochester, which abounds in fine fruits and flowers, might have been justly proud. But few brought forward articles for exhibition, yet those who did so are deserving of the more credit. Too much attention cannot well be bestowed upon such praiseworthy objects as come within the aim and scope of this Society, and we earnestly commend it to the good opinion of every person whose heart is attuned to pure and lofty sentiments awakened by the cultivation and contemplation of Nature as shown in Flowers and Fruits.

We subjoin the substance of the Report of the Committee on Flowers:

PREMIUMS AWARDED TO AMATEURS.

Pansies in baskets, best display, Sarah A. Moulson, $3.

Roses—Best collection classed and named, J. A. Eastman, Esq., diploma.

Verbenas—12 varieties, in pots, finely trained on horizontal trellises, J. Salter, gardener to J. W. Bissel, $3.

Fuchsias—Best collection correctly named, J. Salter, gardener to J. W. Bissell, $5.

Verbenas—7 varieties of seedlings, very fine, and some of them much better than the older sorts, Josiah Salter, gardener to J. W. Bissell, diploma.

Best pair table bouquets, Lillie Greenough and Julia Miller, $3.

Best Floral Ornament—a large pyramid of very fine flowers, to J. C. McNab, gar. to John Greig, Canandaigua, $3.

Second best to Miss Hooker, $2.

Miss Sarah A. Moulson, a beautiful mound of roses, $2.

Miss Adams exhibited two exquisite moss baskets, filled with roses, which were much admired.

Mr. R. Harding presented a beautiful basket ornamented with roses.

Two floral ornaments were very creditable to the exhibitor, Miss McGarry.

Quite a novelty was placed on the table by H. G. Warner, Esq., in the way of an Amaryllis, taken from its native soil by Mr. Warner, on the 31 inst., in the province of New Grenada.

NURSERYMEN.

| | |
|---|---|
| Green House Plants, best collection, A. Frost and Company | Diploma. |
| 2d best do., Ellwanger & Barry | $3 00 |
| Bouquets—best two table, John Donnellan and nephews | 3 00 |
| do. 2d best do., A. Frost & Co | 2 00 |
| do. best two round hand, C. J. Ryan | 2 00 |
| do. 2d do., Ellwanger & Barry | 1 00 |
| do. best flat hand, A. Frost & Co | 2 00 |
| Roses—Best 25 varieties, Wm. King | 5 00 |
| do. 2d best do., A. Frost & Co | 3 00 |
| do. best collection, Ellwanger & Barry | Diploma. |
| do. second best, Samuel Moulson | 5 00 |
| do. best 18 new perpetual and hybrid perpetuals, A. Frost & Co | 6 00 |

Awarded John J. Thomas, for a fine display of roses, and other cut flowers, a diploma.

A very fine floral design 3 feet high, in the form of a vase made of moss and choice selections of flowers, A. Frost & Co., diploma.

## CAYUGA CO. AND GENEVA HORT. SOCIETIES.

When Auburn, Aurora and Owasco unite in one Floral Exhibition, we may justly expect something very recerche; such indeed was the first Exhibition of this Society in the Village of Auburn, on the 17th ult. In the first place, Stanford Hall is one of the finest in the country for such an Exhibition, and the Committee completed their arrangement of it with a perfection I have never seen excelled.

The whole display was an exceedingly gratifying one. Roses were there in the greatest abundance. One gentleman I was told contributed one thousand—such as 48 Specimens of Geo. 4th, and several other choice varieties the same number; then 15 fine specimens of Geant de Battailles, and many other choice varieties, and so on. I should think one gentleman contributed 30 fine boquets from his own private garden, besides competing on roses and various other choice flowers.

The show of Summer Fruits, particularly strawberries, was very fine Messrs Thorp, Smith, Hanchett & Co., of Syracuse, have a fine display of Roses, Green House Plants, &c. In the evening the premium boquets, flowers and fruits were sold to citizens at the most liberal prices. If the same spirit continues to prevail, this society will soon become one of the most interesting and important in our country.

Towards evening of that day I looked through the fine garden of Messrs H. E. Smith and Mr. Sidney Warner, of Waterloo, where I noticed a great variety of beautiful roses, mammoth delicious strawberries, and all the other et ceteras with which our best Horticulturists are now filling up their private gardens. Mr. Smith's garden, I wish to name particularly as a model. It is the most thoroughly cultivated and most completely well filled of any small spot of ground I have ever seen.

On the 23d, a similar Horticultural Exhibition of the Seneca Agricultural and Horticultural Society was held at Geneva, and although it was only a town society, yet it almost rivaled the fine one in Cayuga county. I never knew ladies of wealth, taste and high standing so lavish of their personal efforts, their green house and garden stores, as were the ladies of Geneva, and as a consequence a very rich treat was afforded to the public. Very large collections of roses and other flowers, with the same immense number of boquets graced the exhibition, as did that at Auburn. The best hand boquet at Geneva sold at auction in the evening for $5.75. More than one hundred dishes, comprising more than fifty varieties, of large and luscious strawberries were also on the tables.

Messrs Thorp, Smith Hanchet & Co., of Syracuse, and also Dell Collins, & Waterloo, made a most creditable exhibition of choice fruits and flowers, which added very much to the interest of the exhibition and the reputation of their respective establishments.

R. G. P.

Geneva, N. Y. June 24, 1853.

## BUDDING OR INOCULATION OF ROSES.

We extract the following seasonable article on this subject from Buist's Flower Garden Directory:

According to what we have previously hinted in regard to having roses with standards where such are desired, the month of July or August is a proper time for the operation of budding. The kinds to be taken for stocks should be of a stem of fine growth; such as *Madien's Blush, Dutch Tree, R. Villosa, R. Carmina*, and frequently the *French Eglantine*, are taken. Be provided with a proper budding knife, which has a sharp thin blade, adapted to prepare the bud, with a tapering ivory hatt, made thin at the end, for raising the bark of the stalk. For tying use bass strings from Russia Mats, which should be soaked in water to make them more pliable. The height of the stalk or stem at which the bud is to be inserted, is to be determined by the intended destination of the tree, (as it may be properly called.) Choose a smooth part of the stem, from one to three years old.—Having marked the place, prune away all the lateral shoots about and underneath it. With the knife directed horrizontally, make an incision about half an inch long in the bark of the stock, cutting to the wood, but not deeper; then apply the point of the knife to the middle of this line, make a perpendicular incision under the first, extending from it between one and two inches.—Having a hearty shoot of the growth of this year provided, of the kind that is desired, begin at the lower end of this shoot, cut away all the leaves, leaving the foot stalk of each. Being fixed on a promising bud, insert the knife half an inch above the eye, slanting it downward, about half through the shoot. Draw it out about an inch below the eye, so as to bring away the bud unimpaired with the bark, and part of the wood adhering to it; the wood now must be carefully detached from the bark. To do this, insert the point of the knife between the wood and the bark at one end, and holding the bark tenderly, strip off the woody part, which will readily part from the bark, if the shoot from which the piece is taken has been properly imbued with sap.

We once budded three eyes of the white moss rose, after they had, by mistake, been carried in the pocket of a coat three days. The shoot was soaked six hours in water, and two of the buds grew. From this we infer that the shoots, if properly wrapped up, may be carried very great distances, and grow successfully. Look at the inner rind of the separate bark, to see if that be entire. If there be a hole in it, the eye of the bud has been pulled away with the wood rendering the bud useless, which throw away; if there be no hole, return to the stock, and with the haft of the knife gently raise the bark on each side of the perpendicular incision, opening the lips wide enough to admit the prepared slip with the eye.—If the slip is longer than the upright incision in the stock, reduce the largest end.—Stock and bud being ready, keep the latter in its natural position; introduce it between the bark and wood of the stock, pushing it gently downward until it reaches the bottom of the perpendicular incision. Let the eye of the bud project through the centre of the lips; lay the slip with the bud as smooth as possible, and press down the raised bark of the stock. The bud being deposited, bind that part of the stock moderately tight with bass, beginning a little below the incision, proceeding upwards so as to keep the eye uncovered, finishing above the incision.

In a month after the operation, examine whether the bud has united with the stock. If it has succeeded, the bud will be full and fresh, if not, it will be brown and contracted. When it has taken, untie the bandage, that the bud may swell and in a few days afterwards cut the head of the stock off about six inches above the inoculation, and prevent all shoots from growing by pinching them off. This will forward the bud, which will push and ripen this season. But it must be carefully tied, as it grows, to the remaining head of the stock. Some do not head down the stock until the following spring, thereby not encouraging the bud to grow, which, if winter sets in early, is the safest method.

## APPLE TREE BORERS.

In New England there is no greater pest to the cultivator, than the apple tree borer. In some parts it has destroyed whole orchards. Many persons, in fact, most persons, fold their hands in despair, and let the trees die. I have done better, by the help of the Horticulturist—having profited by the directions given by the Editor three or four years ago. These directions are the only ones that I have seen that strike directly at the root of the matter—that is to say, by preventing the borer in a winged state, the last of May and the first of June from *depositing its eggs* in the bark of the tree, and thereby laying the foundation of a new brood. The old mode of killing the borers by pushing wires into their holes in the trunk of the tree, is good as far as it goes—but it only goes half way. Since, if you succeed in killing all the grubs in that tree, a fresh set may fly over from your neighbors' trees, as soon as the grubs hatch out, and lay their eggs in yours. The plan recommended by the Editor of the Horticulturist, does the whole business; as many new subscribers whose trees may be infected, have not that prescription at hand, I shall beg leave to repeat it.

First, kill all the grubs in the trunk of the tree, by pushing a wire up the holes as far as possible. Then take a pail—fill it half full of thin soft soap, and stir in enough tobacco water to make it two-thirds full.—Having first scraped off any loose bark, next apply this tobacco and soap paint with a stiff brush, to every part of the trunk, and larger part of the limbs—putting it on especially thick at the "crotches," and the base of the trunk—the places where the borer likes best to deposit its eggs. If this is done early in May, I can answer from experience for its efficacy. No borer will deposit her eggs in bark coated over this way. —*Horticulturist.*

To Keep Birds from Picking Fruit.—As the season is coming on for the depredations of birds, I beg to report my experience of last year, when I saved my currants and gooseberries by winding colored worsted around and across my bushes; and my cherries by hanging up several pieces of tin with strong thread in the different trees, two pieces being hung near enough together to clash with the wind, which sound, with the bright reflection of the tin in the sun, certainly frightened them away; and I had my due share of fruit, which, the preceding year, I was obliged to relinquish to them. —*Agricultural Gaz.*

# Domestic Economy.

## TO PRESERVE BEANS AND PEAS.

A new method for keeping the above fresh for any length of time, so that they shall lose neither their taste nor original softness, has been lately introduced to notice by A. Albert, of Paris. Take the beans when not much bigger than large peas, and pursue the following directions for both vegetables:

Plunge them for a minute in boiling, and afterwards in cold water, and after having drained off the water, spread them out for several hours on canvass frames. Then place them in an oven slightly heated, on frames covered with paper, leave them long enough to be at the same warmth as the oven, and then expose the frames to a current of air until the articles are cold. The frames are then replaced in the oven and again exposed until the beans or peas are perfectly dry, not so as to break, but almost like beans dried naturally.

The articles should be gathered and dried on the same day, if not they should be left during the night in the oven; they should be kept in dry and clean bottles, and to each bottle of beans there should be added a bunch of dry savory. Before using the vegetables they should be steeped some hours, in tepid, or over night in cold water; if they are beans the water is thrown away and they are cooked in the usual manner, but if peas, they are only just covered, and they are cooked like green peas. Vegetables prepared in this manner are quite as good as if they had been just gathered.

Syrup for Preserves.—An excellent syrup is made in the following manner:—Take 8 lbs of bright, clear New Orleans molasses or sugar-house syrup, and mix it with 8 lbs. pure water, and 1 lb. of coarsely broken clean charcoal. Stir and boil the mixture 15 or 20 minutes and strain while hot through double flannel. Wipe the kettle clean, and boil again with the white of an egg, till the syrup would form a candy in cooling, then strain again and put in the fruit and cook as usual. Preserves made in this way have a peculiar pleasant flavor, and keep better than when made with sugar.

Preserving Preserves or Sweetmeats.—Housekeepers complain, particularly in warm weather that they cannot keep preserved fruit sweet. This is partly owing to its not being cooked enough, and partly to exposure to the air. Make the jars air tight and the fruit will keep if it is not cooked.—The easiest way to do this is to brush over a sheet of paper with the white of an egg, and cover the jar, pressing it down around the edges when tight. It is cheaper, neater, and better than sealing up the mouth of the jar with wax, or coversing it with bladder.

# Mechanic Arts, &c.

## LIST OF PATENT CLAIMS

ISSUED FROM THE UNITED STATES PATENT OFFICE

For the week ending June 21, 1853.

Horatio Allen and D. G. Wells, of N. York, N. Y., for improvement in cut-off for steam engines.

Benjamin E. Colley, of Cambridge, Mass., for improvement in piano fortes.

Wm. H. Danforth, of Salem, Mass., for improvement in power printing presses.

John A. Elder, of Westbrook, Me., for improvement in Jacquared apparatus for looms.

Edmund L. Freeman, of Ann Aarbor, Mich., for improvement in bog cutting cultivators.

Fred. W. Howe, of Windsor, Vt., for improvement in machines for planing metal.

Wm. S. Hyde, of Townsend, O., for improvement in cultivator plows.

Simon Ingersoll, of New York, N. Y., for improvement in feed motion in plug cutting machines.

John H. Manny, of Waddam's Grove, Ill., for improvement in cutters to harvesters. Dated June 21, 1853. Patented in England, Dec. 9, '52.

David H. B. Newcomb, of Conewango, N. Y., for improvement in hill-side plows.

Augustus R. Pope, of Somerville, Mass., for improvement in electro-magnetic alarms.

George Rohr, of Charlestown, Va., for improvement in seed planters.

J. R. Shank, of Buffalo, Va., for improvement in lath machines.

Walter Sherrod, of Providence, R. I., for improvement in expanding mandrels for turning machinery.

Wm. K. McThornton, of Bloomsburg, Pa., for improvement in horse collars.

Joseph H. Tuttle, of Seneca, N. Y., for improvement in saws.

Jonas B. Wilder, of Belfast, Me., for improvement in hill-side plows.

Benj. R. Norton, of Syracuse, N. Y., for improvement in metallic pointed pens.

Wm. F. Tyson, of Orwigsburg, Pa., for improvement in propellers for canal navigation. Dated June 21, 1853. Ante-dated Dec. 21, 1852.

Enoch Hidden, of New York, N. Y., for improvement in side-lights for ships.

R. L. Hawes, of Worcester, Mass., for improvements in envelope folding machines.

RE-ISSUE.

Alfred T. Serrell, of New York, N. Y., for improvement in machinery for making mouldings. Patented May 16, 1848. Re-issued Jan. 7, 1851. Re-issued June 21, 1853.

DESIGNS.

John T. Davy, of Troy, N. Y., for design for a cook stove.

John Sabey, Jr., of Rochester, N. Y., assignor to James K. Griffin, of Waterdown, Canada West, for design for a cooking stove.

Everard Bolton, of Northern Liberties, Pa., assignor to Abraham and Joseph Cox, of Philadelphia, Pa., for design for a cook stove.

Written for Moore's Rural New-Yorker.

## THE LUNAR INFLUENCES.

Under this head I had the pleasure of announcing about two years since, that the result of a series of investigations into the influence which the lunar rays exerted, showed the existence of a cooling influence upon the temperature of the earth. This fact I had deduced from comparing the nightly depressions of the temperature at the earth's surface, as calculated from observations made by Mr. E. Meriam, of the Brooklyn Heights, commencing with Dec 1st, 1847, and continuing the research thro' a period of twelve lunar months, giving me as a result, (taking the total depression of the temperature during the period of least light as unity,) the lunar influence at about one-fifth or one-sixth of the radiating power of the earth's surface, as observed during the two periods of from 9 P. M. to 4 o'clock, A. M., and from 4 o'clock, P. M., to 4 A. M. I have since obtained a copy of the Girard Observations, for the years 1842, '43, '44, and find, on treating them in the same manner, that they give me similar results—the resulting fraction (with the unit as above.) being even greater than before—being over one-fifth of the whole reduction, or more than one-fourth of the reduction during the period of the new moon.

I obtained these results by dividing the lunar months at the half moon, which gives me two parts, the one of the greatest and the other of the least moon light. If, now, the moon exerts no influence on the temperature of the earth, these two parts ought to nearly balance but; if, on the contrary, the earth is *warmed* by moonlight, the reduction of temperature should be less during the period of the greatest moonlight. But I find that the result is the reverse of this, and that the temperature is the least during the period of the greatest moonlight, and consequently that there is a *cooling* influence in the rays of the moon. Now, we find that there is but one legitimate conclusion at which we can arrive, which is this: There is an *affinity* existing between light and caloric; they tend to unite when separated as a natural result of the action of this affinity.

It is well known by physicists that light possesses the property of being more easily refracted than heat, and that it suffers a greater amount of refraction, in passing from a rarer to a denser medium, than does caloric. This fact is proved by decomposing the solar rays with a prism, when it is observed that the *caloric rays* are turned aside but little from a direct course, whilst the red rays are turned aside further, and the other *colorific rays* undergo greater refraction still. This fact is further established by resorting to experiment with the common burning lens, when it is found that the focus of light is nearer the glass than is the focus of heat. This proves that the rays of light are more easily refracted than are the rays of heat, for they are brought to a focus sooner.

We now seek for some opportunity to test this law, which we have assumed to exist. It is evident that we have but little chance of establishing its truth by using apparatus for the direct purpose of proving this, for the subject is a delicate one, and the amount of sensible caloric at any point of observation on the globe we can assume is so great that the disengaged light will combine with this free caloric, and still the supply will be so abundant that the loss will be scarcely perceptible; (I presume that it *may* be possible to detect this power, by the aid of delicate instruments.) There is one feasible mode of testing the truth or falsity of this theory, and it is found in observing the influence of the rays of the moon.

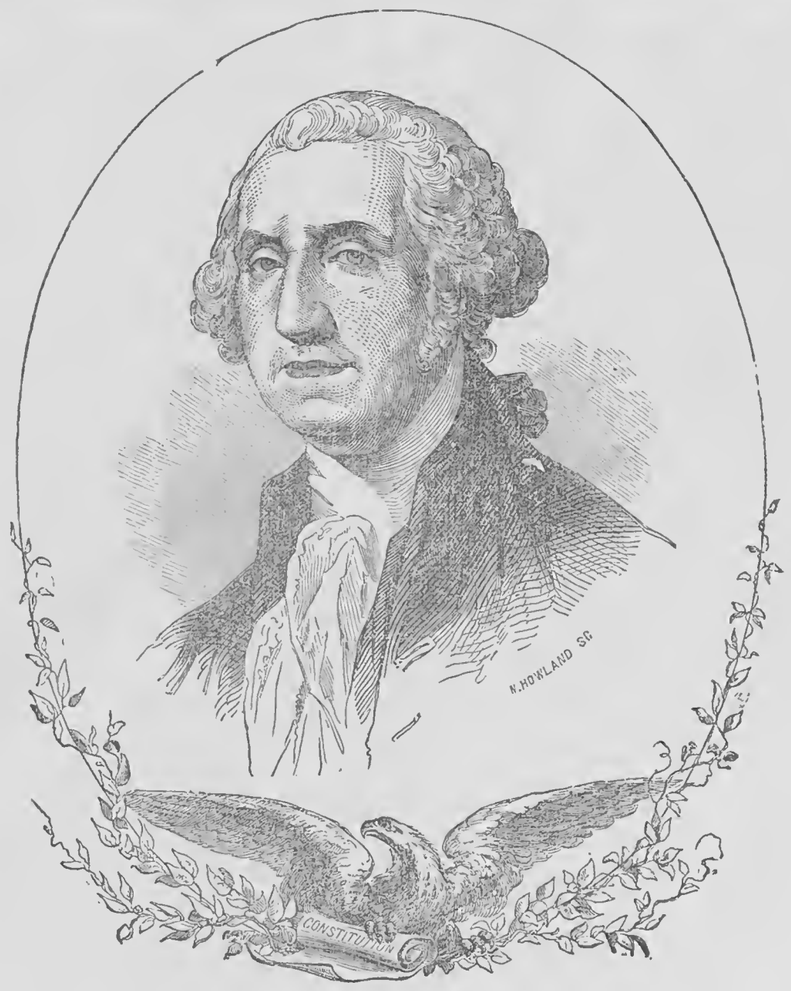
We will endeavor to explain the method of applying this test. Heat is more easily absorbed than light: this is proved by passing light through a thick plate of glass or other transparent substance; the light will be found to have almost entirely lost its heating or calorific rays. The earth *receives* no light from the sun during the night, (we speak of the side which is not turned towards the sun.) and consequently receives no heat; but when the moon is in opposition to the sun she turns her illuminated side towards the earth, and the earth receives a portion of the reflected rays from the moon. The surface of the moon is convex and consequently renders divergent the rays which are thrown back from the surface, and as the heating portion of those rays cannot be as readily separated as are the rays of light alone, the rays of light are separated from their proper share of caloric, and reach the earth with their affinity for caloric in full action, and then unite with the free caloric which is radiated from her surface and render a portion of this free caloric insensible. But if this position fails (as perhaps it may,) we assume another and stronger ground. The heating rays being more easily absorbed than are the rays of light, at the moment they reach the surface of the moon, absorbed by that plant, and the light (or a portion of it,) is reflected *minus* a portion of its caloric; on reaching the earth, these reflected rays of light are met by the free caloric thrown off by the earth, and they unite by reason of this affinity, and so reduce the temperature of the earth's surface.

That light and heat do possess such an affinity as I have here suggested, I consider highly probable, if not conclusively proved by the result of the above mentioned researches. The result of the reduction of the Girard Observations, I consider to be almost unquestionably conclusive as to the existence of the lunar influence I have announced. It may be objected that if this influence had existed, it would have been discovered long ago by those acute observers who have long been in the field; but when we consider the difficulty attending the solution of this problem, and the multifarious disturbing causes which are constantly present, we can no longer wonder that it has been until now unperceived.—Indeed nothing but the merest accident led me to the investigation of this matter, and the subject was long perplexed by doubts, as to the manner in which the problem could be solved. I know not how it may be with others, but I am perfectly satisfied with the result as deduced from a series of observations, extending over a period of more than thirty lunar months, taken at two different periods, and without selecting periods peculiarly favorable, and with the single design of proving the truth of the proposition: *The lunar rays possess a cooling property.*

C. H. Strowger.

Rochester, N. Y., June, 1853.

An Improvement in Cultivators has been made by Samuel Churchill, of West Henrietta, N. Y. The nature of the invention consists, in a peculiar manner, of elevating and depressing the frame which holds the shares, and the shares themselves, by means of which they may be made to penetrate the earth at the required distance, and make deep or shallow furrows, as desired, or be raised, and kept entirely from the earth when the implement is being drawn from one locality to another. The mode adopted by Mr. C., to accomplish this object is by means of levers and connecting rods or stirrups attached to the frame, which are under the immediate control of the driver. Measures have been taken to secure a patent.—*Sci. Am.*



GEORGE WASHINGTON.

**"First in War,—First in Peace—First in the Hearts of his Countrymen."**

To all who venerate the great and good, it will seem most proper that, on the Anniversary of American Independence, mention should first be made of him who was, emphatically, "First in War, First in Peace, and First in the Hearts of his Countrymen." At such a time, it is a sacred yet pleasant duty for Americans to revert to the history of the early days of the Republic—to celebrate in an appropriate manner, the Glorious Events which gave birth to our new prosperous and widely extended Nation. The occasion is one which will naturally arouse the love of Country, and quicken the pulse in every patriotic heart—including emotions of joy, congratulation and thanksgiving for the privileges vouchsafed to the people of this highly favored land.

On such an occasion, next to a proper veneration for Him who governs and controls all, should be held in sacred remembrance the memory and deeds of the man who combined the best traits of the Hero, the Statesman and the Christian—who is, and will be for all time, the Patron Saint of America—the immortal WASHINGTON. To recount, here, the history of one whose exemplary life and noble deeds are familiar to almost every reader, would perhaps be a work of supererogation. And yet, did space permit, we would gladly trace the career of him of whom it has been well said, "God ordained he should be childless, that the country might call him Father." Indeed we hold it to be the duty of the Journalist to omit no proper occasion, like the present, of commemorating this illustrious man—of recapitulating the events of the "times that tried men's souls," and enjoining upon all, their obligations to WASHINGTON and his compatriots for the freedom and unexampled prosperit of our People and Nation. May the story of his heroic deeds, wise acts and judicious counsels, be graven upon the hearts of his countrymen, and annually impressed upon the minds of the rising generation!

## DECLARATION OF AMERICAN INDEPENDENCE.

**Unanimously Adopted July 4, 1776.**

WHEN, in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth the separate and equal station to which the laws of nature and nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident—that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty, and the pursuit of happiness; that to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that whenever any form of government becomes destructive to these ends, it is the right of the people to alter or abolish it, and to institute a new goverment, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness. Prudence, indeed, will dictate that governments long established should not be changed for light and transient causes; and, accordingly, all experience hath shown that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security. Such has been the patient sufferance of these colonies; and such is now the necessity which constrains them to alter their former systems of government. The history of the present king of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute tyranny over these States. To prove this, let facts be submitted to a candid world:

He has refused his assent to laws the most wholesome and necessary for the public good.

He has refused to pass other laws, for the accommodation of large districts of people, unless those people would relinquish the right of representation in the legislature—a right inestimable to them, and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved representative houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.

He has refused, for a long time after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large, for their exercise; the state remaining in the meantime, exposed to all the danger of invasion from without and convulsions within.

He has endeavored to prevent the population of these States; for that purpose obstructing the laws for the naturalization of foreigners, refusing to pass others to encourage their migration hither, and raising the condition of new appropriation of lands.

He has obstructed the administration of justice, by refusing his assent to laws for establishing judiciary powers.

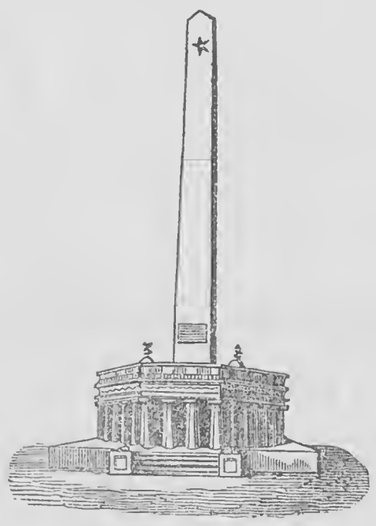
He has made judges dependent on his will alone for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of new offices, and sent hither swarms of officers, to harrass our population and eat out their substance.

He has kept among us, in time of peace, standing armies, without the consent of the legislature.

He has affected to render the military independent of, and superior to, the civil power.

He has combined with others to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws, giving his assent to their acts of pretended legislation—



WASHINGTON MONUMENT.

For quartering large bodies of armed troops among us:

For protecting them, by a mock trial, from punishment for any murders which they should commit on the inhabitants of these States:

For cutting off our trade with all parts of the world:

For imposing taxes on us without our consent:

For depriving us, in many cases, of the benefits of trial by jury:

For transporting us beyond seas, to be tried for pretended offences:

For abolishing the free system of English laws in a neighboring province, establishing therein an arbitrary government, and enlarging its boundaries, so as to render it at once an example and fit instrument for introducing the same absolute rule into these colonies:

For taking away our charters, abolishing our most valuable laws, and altering fundamentally the forms of our government.

For suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever:

He has abdicated government here, by declaring us out of his protection, and waging war against us.

He has plundered our seas, ravaged our coasts, burnt our towns, and destroyed the lives of our people.

He is, at this time, transporting large armies of foreign mercenaries to complete the works of death, desolation, and tyranny, already begun, with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our follow-citizens, taken captive on the high seas, to bear arms against their country, to become the executioners of their friends and brethren, or fall themselves by their hands.

He has excited domestic insurrection among us, and has endeavored to bring on the inhabitants of our frontiers the merciless Indian savages, whose known rule of warfare is an undistinguished destruction of all ages, sexes, and conditions.

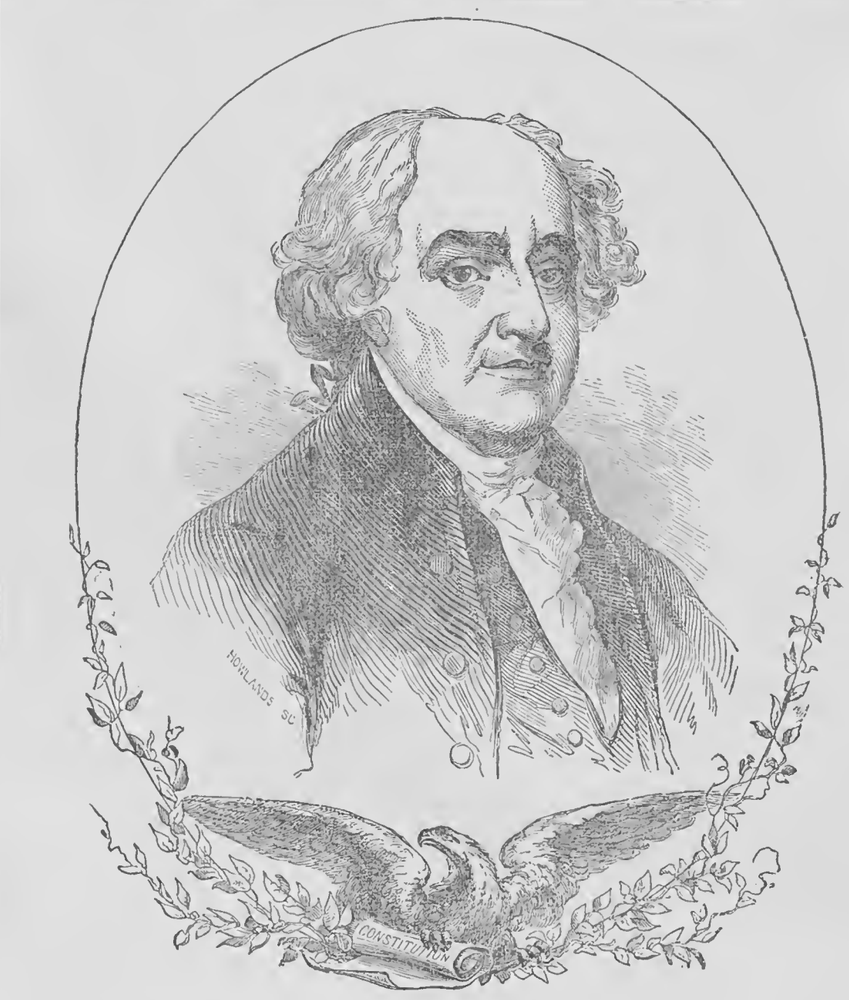
In every stage of these oppressions we have petitioned for redress in the most humble terms; our repeated petitions have been answered only by repeated injury. A prince whose character is thus marked by every act which may define a tyrant, is unfit to be the ruler of a free people.

Nor have we been wanting in attention to our British brethren. We have warned them, from time to time, of attempts made by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred, to disavow these usurpations which would inevitably interrupt our connexion and correspondence. They, too, have been deaf to the voice of justice and consanguinity. We must, therefore, acquiesce in the necessity which denounces our separation, and hold them as we hold the rest of mankind—enemies in war—in peace, friends.

We, therefore, the representatives of the United States of America, in general Congress assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the name and by the authority of the good people of these colonies, solemnly publish and declare that these united colonies are, and of right ought to be, free and independent States; that they are absolved from all allegiance to the British crown, and that all political connexion between them and the State of Great Britain is, and ought to be, totally dissolved; and that, as free and independent States, they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which independent States may of right do. And for support of this Declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other OUR LIVES, OUR FORTUNES AND OUR SACRED HONOR.

THOMAS JEFFERSON.

**Author of the Declaration of American Independence.**



JOHN ADAMS.

### JOHN ADAMS'S LETTER.

THE following is an extract from the memorable and prophetic letter of JOHN ADAMS, written the day after the Declaration of Independence was passed by Congress:

Philadelphia, July 5th, 1776.

"SIR:—Yesterday the greatest question was decided which was ever debated in America, and greater, perhaps, never was or will be decided by men. A resolution was passed without a dissenting colony, THAT THESE UNITED STATES ARE, AND OF RIGAT OUGHT TO BE FREE AND INDEPENDENT STATES.

The day is passed. The 4th of JULY, 1776, will be a memorable epoch in the history of America. I am apt to believe *it will be celebrated by succeeding generations as a great Anniversary Festival.* It ought to be commemorated as the DAY OF DELIVERANCE, by solemn acts of devotion to Almighty God. It ought to be solemnized with pomp, shows, sports, guns, bells, bonfires, and illuminations *from one end of the Continent to the other*, from this time forward forever.

You will think me transported with enthusiasm, but I am not. I am well aware of the toil, and blood, and treasure that it cost to maintain this Declaration, and support and defend these States, yet through all the gloom, I can see the rays of Light and Glory—I can see that the end is worth more than all the means, and that posterity will TRIUMPH, although you and I may rue, which I hope we shall not.

I am, &c., JOHN ADAMS."

### THE AMERICAN UNION.

1607—Virginia first settled by the English.
1614—New York first settled by the Dutch.
1620—Massachusetts settled by the Puritans
1623—New Hamp. settled by the Puritans.
1625—New Jersey settled by the Dutch.
1627—Delaware by the Swedes and Fins.
1634—Maryland settled by Irish Catholics.
1635—Connecticut settled by the Puritans.
1736—Rhode Island by Roger Williams.
1650—N. Carolina settled by the English.
1670—S. Carolina settled by the English.
1682—Pennsylvania settled by Wm. Penn.
1733—Georgia settled by Gen. Oglethrope.
1791—Vermont admitted into the Union.
1792—Kentucky admitted into the Union.
1796—Tennessee admitted into the Union.
1802—Ohio came into the Union as a State.
1811—Louisiana admitted into the Union.
1816—Indiana admitted into the Union.
1817—Mississippi admitted into the Union.
1818—Illinois admitted into the Union.
1819—Alabama admitted into the Union.
1824—Maine came into the Union as a State.
1821—Missouri admitted into the Union.
1836—Arkansas admitted into the Union.
1845—Florida admitted into the Union.
1845—Texas admitted into the Union.
1848—Iowa admitted into the Union.
1848—Wisconsin admitted into the Union.
1850—California admitted into the Union.

"The thunders of a mighty age,
May drown the voices of the past,
But thou, the Printer and the Sage,
Shall speak thy wisdom to the last."

# Miscellaneous.

Written for Moore's Rural New-Yorker.

## THE JOCUND JUNE.

BY H. N. F. LEWIS.

'Tis June! 'Tis June! Resplendent month of June!
And all is gayety; replete
With song of blithsome birds, and balm of fairest flowers,
Melodious notes—ambrosial perfume
From sunlit, blooming meads and basky bowers
The bright, effulgent skies our hearts illume,
And cooling breezes mitigate the heat,—
And all is happiness pre-eminently sweet.

Fair fields have donned their garmenture of green;
Blue skies are gemmed with lustrous light,
And earth, and air, and heaven, with one accordant voice
Chant strains seraphic o'er their gorgeous sheen:
The emerald fields, the radiant skies rejoice,
And mortals gazing on th' enrapturing scene
At the auspicious dawn of Nature's night
Exult in ecstacies of halcyon delight.

And life is brightening, and its path opes clear;
Prospective weal dark doubts remove—
Despondency hath gone, discord hath fled away,
Gloom is dispelled—our sky no more is drear;
The morning of a long, bright, happy day
Of calm, quiescent trust, unsealed by fear,
Hath broken in our soul—the light of love
And jocund joyousness, foretaste of Heaven above.

Pavilion Villa, N. Y., 1853

## LONDON LITERARY LIONS OF THE DAY.

In a charming mansion in St. James' Place, secluded somewhat from the roar and tumult of the great city, still lives the venerable poet of the "Pleasures of Memory," whose great age (ninety years have rolled over his bald ripe forehead,) disqualifies him for taking his long accostomed walk about the metropolis. Mr. Rogers sat in Westminster Hall when Burke and Sheridan were pouring out their invectives against Warren Hastings, and all London was ringing with the applauses which the eloquent Brinsley elicited on that occasion. He is, therefore, part and parcel of by-gone-days, and very good authority on what happened during the last sixty years.

In a fine large house in Tavistock Place, Tavistock Square, sits Charles Dickens, busy as a bee over "Bleak House" and "Household Words." On an afternoon the loiterer in that vicinity may catch a glimpse of his thin hair, now sprinkled with gray, as it is tossed by the summer wind, which visits his desk as he sits writing in his ample writing room. It is not an unfrequent occurrence to meet him in a rail car, rushing out of London for a few day's respite at Brighton or Bath.

Thackeray has ere this got home again, and any fine day between 12 and two o'clock, he may be found at the Garrick Club in King street, Convent Garden, poring over a French newspaper, or chatting with Albert Smith over a mutton chop and sherry additions. It is not an unusual thing to find him at one end of poor old Charles Kemble's ear trumpet, or vis-a-vis with Buckstone, the comedian, discussing old actors and defunct Drury Lane.

Barry Cornwall lives in Hadly street, Cavendish Square, where he is spending the happy evening of his life, beloved by all who are fortunate enough to know one of the most glorious song writers in the English tongue.

Walter Savage Landor is at home in Bath, having been expelled from Italy on account of his "dangerous liberty doctrines." At rare intervals he goes up to London, and then his host of friends flock around him, and make his fine old face radient with smiles at the profuse hospitalities poured upon him.

In the village of Twickenham, in a modest brick house by the roadside, muses Alfred Tennyson, the Poet Laureate of England. His own publisher only meets him once or twice a year, as he eschews London and loves privacy. As you walk by the side of the Thames on a Sunday evening, at the sunset hour, sometimes the wide hat of Alfred, the bard of "Locksley Hall," is visible.

The Brownings are like swallows, flitting from clime to clime, but London is often in their way, and they may be met not unfrequently at the National Gallery in Trafalgar square, or at the opera. Both are so delightful to encounter, this pleasure, like all exquisite enjoyments, is rare.

If one should try very hard to get a glimpse of the illustrious Thomas Carlyle, the great "Sartor Resartus" of modern Europe, he would find it a difficult matter. Thomas likes to be a lion, but he don't want anybody in his own cage beside himself.—He lives in Chelsea, and often comes to town, but to find him often is not common even to his best friends.

Macaulay is a club man, and when he is not among his idols (the books of the British Museum) he may be met within the brilliant halls of the Athonæum or the reform. On a lazy, hazy London day proper, he might with a certainty be counted on over a folio in a snug alcove at the British.

Dear, kind, genial old Leigh Hunt, toddling over the pavement in the Strand, towards his son's newspaper office, is a common occurrence. He lives a few miles from the dust of Fleet street, but he seems to love its dingy walls and grows warm and eloquent over its rush and whirl. Is he the Skimpole of Bleak House? The knowing ones of London say he is.

On the left, as you go up Piccadilly towards the Parks, stands a neat book shop, with Chapman & Hall over the door. The tall gentleman with a nose, and the waistcoat, and the elegant cravat, is Sir Edward Lytton, or Bulwer, as you may happen to call him. He is telling Mr. Chapman, who has his ear close to the Baronet's bosom, that the engraving just brought for his inspection is not quite right in the direction of the whiskers and the shirt collar. Spite of his dandy aspect and his affected drawl, no better hearted gentleman wields the fluent quill than the author of "My Novel." Whenever he runs down from his elegant retreat at Knebworth to London, he does so many kind acts for the poor brother authors that "Bulwer's guineas" are sure as morning suns, or evening stars.—*Boston Trans.*

JUDGE HOPKINSON.

Author of the celebrated National Lyric, "Hail Columbia."

Joseph Hopkinson is a name destined to live forever, as the author of that stirring National Lyric, "Hail Columbia." It was written during the summer of 1789, when there was a prospect of war with France, and our people were much divided by political party questions, growing out of the contest between that country and England. Its object was to aid in arousing an American spirit, which should lead all classes to regard the interests of our young Republic as above all price. In this object, it was very successful, becoming one of the "songs of the people," to which every American heart responded.

"What a mighty power there is, after all, in a simple song or ballad. It has often more influence than a ponderous volume. This song of Hopkinson's, is an extremely simple one. There is no logic in it—no parade of fine words. But when it is sung, it excites in the breast of every patriot a glow of enthusiasm for our Republic, warmer perhaps, than that of the eloquence of a Patrick Henry or a Webster."

Joseph Hopkinson was the son of Francis Hopkinson, one of the Signers of the Declaration of Independence. He was born in Philadelphia, in 1770, and during his life, which terminated a few years since, has filled various public offices. He served two terms as a member of Congress, and for many years was Judge of one of the District Courts of Pennsylvania.

### HAIL COLUMBIA.

Hail Columbia! happy land!
Hail ye heroes! heaven-born band!
Who fought and bled in freedom's cause,
Who fought and bled in freedom's cause,
And when the storm of war was gone,
Enjoyed the peace your valour won.
Let independence be our boast,
Ever mindful what it cost,
Ever grateful for the prize,
Let its altars reach the skies.
Firm—united—let us be,
Rallying round our liberty:
As a band of brother's join'd
Peace and safety we shall find.

Immortal patriots! rise once more;
Defend your rights, defend your shore;
Let no rude foe, with impious hand,
Let no rude foe, with impious hand,
Invade the shrine where sacred lies
Of toil and blood the well-earn'd prize.
While offering peace sincere and just,
In heaven we place a manly trust,
That truth and justice will prevail,
And every scheme of bondage fail.
Firm—united, &c.

Sound, sound, the trump of fame!
Let Washington's great name
Ring through the world with loud applause,
Ring through the world with loud applause,
Let every clime to freedom dear,
Listen with a joyful ear;
With equal skill, and God-like power
He govern'd in the fearful hour
Of horrid war; or guides with ease,
The happier times of honest peace.
Firm—united, &c.

Behold the chief who now commands,
Once more to serve his country stands—
The rock on which the storm will beat;
The rock on which the storm will beat;
But arm'd in virtue, firm and true,
His hopes are fix'd on heaven and you.
When hope was sinking in dismay,
And glooms obscured Columbia's day,
His steady mind, from changes free,
Resolv'd on death or victory.
Firm—united—let us be,
Rallying round our liberty;
As a band of brothers join'd,
Peace and safety we shall find.

## TO THE GIRLS.

There is an old lady away out in Mahoning, who says you go to frolics, apple-butter boilings, singing and quilting parties 3 or 4 evenings in a week, and then say you have not time to read—that you go to the circus or show every time it comes into the neighborhood, and spend money in these amusements' while you pretend you can not afford to subscribe for a paper, or buy a book. Now, if I did not know you very well, I would be sure she was slandering you. It does appear absurd to suppose girls would be such ninnies; but as you and I are so well acquainted, I know she is just telling truth about a great many of you, who act as if you did not care to be either wiser or better than you now are. It is all mere fudge to talk about not having time to read, or money to get books and periodicals.—Every body in this country who wants to read can find time, and the means of improvement. Nobody need expect to be respected and happy through life who does not love to read. It is reading more than anything else, that makes one woman or man superior to another. Savages do not read, but spend their leisure time "going to frolics," as this Mahoning lady says you do, and this is what keeps them savage.—*Mrs. Swisshelm.*

## PRESIDENTIAL STATISTICS.

Since the formation of the United States Constitution the people have elected twelve persons to the Presidential chair, all of whom are now dead with the exception of Martin Van Buren and General Pierce.—During the same period of time, thirteen persons have occupied the position of Vice-President, but four of whom are how living: Martin Van Buren, John Tyler, George M. Dallas and Millard Fillmore. The President who lived longest after vacating the Presidential chair, was John Adams, who survived that period twenty-five years. His son John Q. Adams, and James Madison, rank next to him in that respect, both living nineteen years. Mr. Polk died within three months after he left the seat of Government, and General Washington lived but a little over two years after he returned to the shades of Mount Vernon. Among the Vice-Presidents, Aaron Burr lived over thirty years after his term of office had expired, and John Adams was survivor about the same period of time. It is a singular coincidence that three of our Presidents who figured in the days of the Revolution, expired on the 4th of July: John Adams, Thomas Jefferson, and James Monroe, the two first named both dying on the same anniversary, being the fiftieth one from the time Independence was declared in 1776.—Samuel L. Southard, of New Jersey, who as President pro tem. of the Senate, performed the duties of Vice-President under Mr. Tyler, when he was elevated to the Chief Magistracy by the death of Gen. Harrison, died while serving in that capacity, in 1842.

Covetous men need money least, yet most affect it, and prodigals, who need it most, do least regard it.

Do not sigh for this world's goods, nor lament thy poverty. Out of the meanest hovel thou canst get a sight of Heaven.

## WOMAN'S HOME DUTIES.

It may be only a fancy of ours that Providence has so decidedly fitted woman for household cares, that she is never truly and healthily happy without them; but if it be a fancy, it is one which much observation has confirmed. If there be anything likely to banish the fiend *ennui* from the dwellings of women of fortune, it is the habit of assuming a moderate share of the daily cares which go to make home happy. To do every thing by proxy, is to deprive ourselves of a thousand wholesome, cheerful, innocent interests; to nourish our pride and indolence at the expense of our affections; nay, we may add, is there not something almost impious in scorning the position for which God so evidently designed woman, and living an artificial life of our own devising, deputing our duties and privileges to hirelings?

It is a singular delusion this, and of American women in particular, for we know that even in England women of fortune are much more truly domestic in their tastes and habits than we. We remember a story of a certain Duchess cleaning some picture frames, when a protege, who happened to be present, officiously desired to take the office upon himself.

"Child!" said Her Grace, "don't you supposo I should have called a servant if I had not chosen to do it myself?"

The German ladies, with all their cultivation, take the most intimate interest in housekeeping, and they are remarkable for cheerfulness of temper, for natural and charming manners, and for the intelligence and vivacity of their own conversational powers. Who knows but the terrible dearth of subjects of conversation among us might be somewhat mitigated, if our ladies spent a part of every morning among the various cares and duties, on the performance of which so much of the comfort and happiness of life depends, and which call into action far higher powers than those required for the bald chit-chat of an evening party, or the inanities of a morning call?

The universal sentiment of men is in favor of active domestic habits in women.—It is said that men "love to see women delicate;" and so they do, doubtless. But does any moderate amount of attention to home affairs deprive a lady of her delicacy? It may prevent the delicacy of dyspepsia; but few gentleman admire that. Indeed we have yet to discover the man of sense who is displeased by his wife's personal care of the comfort and economy of her house.—Those whose lives are embittered by the lack of it are not far to seek. No houses are regulated with such neatness, accuracy and elegance as those in which the ladies of the family take a personal part in household duties.

Goethe says of a young woman, one of his friends, and a man of genius is entitled to speak for his sex:—"After the death of her mother she displayed a high degree of activity as the head of a numerous young family, and alone had sustained her father in the widowhood. The future husband could thus hope an equal blessing for himself and his descendants, and expect a decided domestic happiness. Every one confessed that she was a woman to be wished for.—She was one of those who, if they do not inspire vehement passion, are found to excite a universal pleasure. A lightly formed symmetrical figure, a purely healthy nature and the glad activity that arises from it, an unembarrassed care for daily necessities—with all those she was endowed. The observation of those qualities was always agreeable to me, and I always sought the society of those who possessed them."—*Mrs. Kirkland.*

## THE WIDOW OF GEN. HARRISON.

The estimable widow of Gen. Harrison still occupies a portion of the old mansion at North Bend, where she is watched over by the filial care of the family of Col. Taylor. She is in the serene evening of a long and eventful life, and, though bearing the weight of many years, is still able to move about her room. This excellent woman became the wife of Gen. (then Capt.) Harrison, near the close of the last century, while he was in command of Fort Washington, now Cincinnati. Her father, Judge Symmes, was principal of the original proprietors of the Miami purchase, a tract of 248,000 acres, which was first purchased at a price of sixty-six cents per acre. The present Harrison estate consists of 800 acres at North Bend, and 420 at the mouth of the Miami. The property is as yet undivided, though it is the intention of the heirs to effect a division the coming season. This step is rendered necessary by the fact that, from the almost constant absence of the proprietor in former years, the productiveness of the land has so far deteriorated that a strong personal interest in the soil is indispensable to its resuscitation. The estate formerly embraced a large tract of intervale land to the northward, but is now mostly composed of high rolling lands near the Ohio.

Every plant that is produced, every child that is born, is a new idea, a fresh expression of the wisdom and goodness of our Creator.

Revenge reaps no reward. It is its own most fearful punishment. Its thirst is death. Deeds of horror are its luxuries.

Custom will have the same effect, with respect to death, as to other frightful things; it will take off its terror.

The noblest remedy for injuries is oblivion. Light injuries are made lighter by not regarding them.

No poultice has ever been discovered to draw out man's virtues so fully as the sod that covers his grave.

Money in your purse will credit you—wisdom in your head adorn you—but both in your necessity will serve you.

# Wit and Humor.

## GREEN VEILS.

Somebody, a great many years ago, said that the bitterest of earthly afflictions was—

"To love and not be loved again."

Next to it, certainly, is the affliction, pain and annoyance of meeting on the sidewalk a pretty female figure with its head tightly wrapped up and enveloped in an impenetrable green veil, which green veil aforesaid bows to you in a woefully bewitching manner, and leaves you standing bare-headed on the walk in a fever of wonder, curiosity and wrath.

We are about petitioning for a law, making it a capital—meaning thereby a kissable—offence, for any female under the age of thirty-five, whose face is not scarred with small-pox, nor otherwise distorted, and who was not born with features like Medusa, to be found wearing a green veil, at any time, or under and pretext, on any sidewalk.—The story of Mokanna shall be copied from Tom Moore's "Veiled Prophet of Khorassan," and affixed to the fifth section of the bill: and thereby we trust to do something for the good and comfort of the masculine community.

A pretty woman is like a great truth or a great happiness, and has no more right to bundle herself up under a green veil, or any other similar abomination, than the sun has to put on spectacles. We like masks, and are fond of masquerades, but regulate our fondness by Solomon's injunction that there is a season for all things. These perambulatory female riddles we do not like—at least, until we know who they are. Then we are as willing as any one to acknowledge that

"A thing of beauty is a joy forever."

Recipes.—To become popular—join the strongest church and all secret societies.

To become respectable—say 'yes' to every other man's opinions and have none of your own.

To become exalted to a little office—be at all times ready to act as a tool for "big men."

To become slandered—edit a paper, tell the truth, and tread on the toes of rogues and squirts.

"How are ye Smith?" says Jones.

Smith pretends not to know him, and replies hesitatingly—"Sir, you have the advantage of me."

"Yes," retorts Jones, "I 'spose so; everybody has that's got common sense."

Smith looks unhappy.

"My opponent, Mr. Speaker, persists in saying that he is entitled to the floor.—Whether this is so or not, I shall not inquire. All I have got to say is, that he will get floored if he interupts me again." Here the gentleman from Bloody Creek pulled up his sleeves and took his neck-tie off.

A doctor and and a poet quarrelled; an indifferent person was applied to, to settle the dispute, when the latter made the following reply:—"You are faulty, both; do penance for your crimes. Bard, take his physic—doctor, read his rhymes."

"What are you going to give me for a Christmas present?" asked a gay damsel of her lover. "I have nothing to give but my humble self," was the reply. "The *smallest* favors gratefully received," replied she.

# Youth's Corner.

"Attempt the end, and never stand to doubt;
Nothing's so hard, but search will find it out."

For the Rural New-Yorker.

## GEOGRAPHICAL ENIGMA.

I am composed of 16 letters.
My 3, 16, 14, 8, 4, 11, 15 is a lake in America.
My 8, 12, 16 is a cape in New England.
My 12, 8, 10, 8, 16, 14 is an island on the coast of New England.
My 16, 11, 8, 13, 2, 4, 8 is a county in the State of New York.
My 15, 7, 6, 1, 3 is a town in Tioga county.
My 3, 9, 7, 6, 5, 3 is a county in the State of New York.
My whole is the name of a Patriot, Hero, and Statesman of the last century.

Coomer, N. Y. P. S. Williams

☞ Answer next week.

For the Rural New-Yorker.

## MISCELLANEOUS ENIGMA.

I am composed of 20 letters.
My 1, 20, 3, 10, 5, 9, 7 form the name of a large city in North America.
My 14, 5, 3, 20, 14, 17 a celebrated manufacturing town.
My 17, 4, 5, 1, 11 is a city in France.
My 19, 10, 15, 2, 12, 5, 3, 1 is a celebrated battle field in the United States.
My 8, 13, 1, 12, 5, 1 is a city in China
My 18, 6, 7, 16, 1, 11, 13, 11 is one of the U. S.
My 8, 5, 9, 7 is a city in Ireland.
My whole is one of the most magnificent structures ever designed by art.

Pavilion, N. Y. J. L. Lewis.

## ANSWER TO ENIGMA, &c., IN NO. 25.

Answer to Geographical Enigma—*The Catskill Mountains.*

Answer to Charade—Anger, Laziness, Cruelty, Hunger, Odium, Hypocrite, Obstancy, Lust. The word "Mystery" contains all the final letters.

Answer to Miscellaneous Enigma—*Captain Ericsson's Caloric Engine.*

MOORE'S RURAL NEW-YORKER

ROCHESTER, JULY 2, 1853.

PUBLISHER'S NOTICES.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW-YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ ADVERTISEMENTS must be brief, appropriate to the objects of the paper, and accompanied with the cash.

## Personal, but Brief.

On the eve of sending this number to press, we are reminded that it is, or will be, the first issue of the second half of our Fourth Volume—affording a fit opportunity for a vote of acknowledgments for the unexpectedly large measure of support accorded to the RURAL NEW-YORKER during the past six months. But we have already expressed our sentiments in response to the very extensive and gratifying increase to our subscription list—and, instead of repeating the former, shall endeavor to exhibit our appreciation of the popularity of the paper in a more tangible manner. According to our notion, gratitude can be rendered most eloquent by appropriate *action*, and we propose to govern ourselves accordingly. To make the RURAL eminently worthy the support of all who may seek its pages for instruction or entertainment, will continue to be our aim—and we shall zealously labor to render its future numbers as valuable and interesting, at least, as those heretofore published.

In this connection we may be permitted to repeat that—The present is a favorable time to subscribe for either six months or a year. The paper will be furnished six months to single subscribers or clubs, at the same proportional rates as for the full year. We add largely to our former edition, in order to furnish new subscribers for some weeks from the commencement of the new half volume. Agents, and friendly readers all, will please bear this in mind—remembering that they can materially aid in extending the circulation of the RURAL, by exhibiting specimens, and "a word fitly spoken." Will our readers do us and their well-to-do (as well as newspaper-borrowing) neighbors, the favor to act in accordance with this suggestion?

## Our National Anniversary.

THE FOURTH OF JULY—our Nation's Birth-Day—should be appropriately celebrated by Americans, and all friends of Freedom and Free Institutions. As this paper will reach most of its readers on or before the 4th, we publish that immortal document, the Declaration of American Independence—together with other matter appropriate to the occasion. We trust the Day will be duly honored—be rationally celebrated, and made an occasion of rejoicing and thanksgiving for the Liberty achieved by our forefathers, and the present unexampled Prosperity of the American People and Nation.

—But while we commend a proper observance of the day, as an evidence of respect and patriotism, we would caution all against carelessness or indulgences. The juniors, especially, should beware how they use gunpowder or fire-works. If you must use these articles, too much caution cannot be exercised. The numerous accidents on each recurrence of the Fourth, should admonish all to be on their guard—and especially that grog and gunpowder are dangerous associates. But we trust this latter hint is unnecessary, in this connection—for RURAL-ists are supposed to be temperate on all occasions.

## The Wool Market.

By private advices received just as we go to press from a well informed correspondent in Liverpool, England, we have the information that at the last sale, "there was a fair number of buyers present, but the competition was not so brisk as we have been accustomed to for many months; and, though no decided change can be made in quotations, prices are in some cases easier. Considerable activity still prevails in the manufacturing districts, consumption is satisfactory, and stock moderate, but we find that the uncertain state of Foreign (Continental) Politics has unsettled purchasers, rendering them less anxious to operate until the future shall become more clear."

In the Western States, the advices are that the sale is nearly over, the amount being somewhat more than last year, for which prices have been paid ranging from 40 to 60 cents, We notice sales of some extra lots at 65c to 67c; but in addition to the quality of the wool it was *well tied up*, an operation that is generally badly performed or omitted altogether to the serious detriment of the seller. The amount of fine wool greatly exceeds that of any previous year, giving increased evidence that farmers understand the policy of producing the best quality if they expect the highest prices.

Nearer home the producers have shown but little anxiety to dispose of their stock, and the market has been quiet, though sales are made without any drooping of prices.

CARY COLLEGIATE SEMINARY.—The Fall term of this institution, located at Caryville, Genesee Co., N. Y., commences on the 17th of August. The Principal, Prof. BALDWIN, has associated with him, as Prof. of Languages and Higher Mathematics, D. G. FRASER, A. B., whom we know to be an excellent teacher in these departments. The Faculty includes four additional members—well qualified for their respective posts.

## Notes from the Capital.

ALBANY, June 27, 1853.

EDS. RURAL:—The Impeachment Case has become a reality. The Assembly, by a large majority, have passed a resolution impeaching JOHN C. MATHER, Canal Commissioner, for "HIGH CRIMES AND MISDEMEANORS." As this is the first case of the kind that has occurred under the present Constitution, it may be instructive to relate the course to be pursued.

1. The Assembly, in the capacity similar to that of a Grand Jury, investigate the charges made against a public officer, and if deemed sufficient to criminate him, they prefer a formal charge against him, similar to an ordinary indictment.

2. The Court for the trial of cases of impeachment, consists of the Senate and Court of Appeals combined. 41 in all. A concurrence of two-thirds of all present is necessary to convict a person.

3. The punishment extends, at the furthest, to removal from office, and disqualification to hold any office under the State. But the person found guilty may be tried for embezzlement, &c., in an ordinary Court.

The Assembly have appointed a Committee of five to prefer the charges against Commissioner MATHER. They have also passed a resolution instructing a Select Committee to examine charges made against other officers of the Government, and report the results during the coming week. A question has come up as to the power of the Legislature to impeach individuals, after their term of office has expired. The decision will probably be in favor of so doing, and the Canal Board under the previous administration will be likely to be overhauled.

A bill has passed the Senate authorizing the Court for the trial of Impeachment to select a place for holding its session. They may desire to go to Saratoga, or some other "watering place," but as the law now stands, the Court must be held at the Capital.

The Maine Law has been discussed at some length in the Assembly, and it will probably be brought to a vote soon. The city of New York presents very strong opposition to its passage, as it would effect their commercial interests to a very great extent. The friends of the bill contend, with very good reason, that such a question should not be decided on the *data* of paltry dollars and cents.

Some hints have been thrown out as to the adjournment of the Legislature, but there is no telling when it will be. Nor is it of much consequence—as it costs *only* 1,500 a day to keep the law-making wheel in motion!

I attended the annual exercises of the Alumni of the Albany Female Academy, which were of much interest. The society has been in successful operation for a dozen years, and has members from all parts of the State. The Clergy and other distinguished citizens give it their cordial approbation and support. Dr. WYCKOFF presided, and after the usual Reports and Essays were read, he conferred the prize medals upon the successful competitors, accompanied by some very spicy and appropriate remarks.

The June Exhibition of the Albany and Rensselaer Horticultural Society came off last week, and attracted considerable attention. The collection of fruits was neither extensive nor varied.—The specimens of strawberries were praiseworthy, but it is rather early for any thing else in that line. Lettuce, cabbage, cucumbers, beets and rhubarb were well represented, and premiums awarded according to merit. But the greatest attraction consisted in flowers, of which there was a large and beautiful collection.

It is pleasing to observe that the competitors and exhibitors are not exclusively professional florists. Many of the finest specimens were from the gardens of private citizens, showing that a commendable attention is paid to this department by others than public gardeners. On the whole, the exhibition was highly creditable, and I trust that the time is not far distant, when every county will support a similar organization.

HENDRICKSON'S trial for murder goes on slowly. The District Attorney has examined the witnesses for the people, and Mr. WHEATON has opened the defence. The case is one of much interest, and attracts large crowds daily. I am sorry to say that hundreds of ladies (?) attend the trial regularly. That morbid curiosity which leads persons to listen to the painful details of criminal prosecution, is highly censurable.

Quite a change has come over the weather. Yesterday, a stove felt comfortable, and we are now having a cold, drizzling shower, such as we might expect about All-fools' day. *OWE.*

THE WEATHER AND CROPS.—*Weevil.*—During the week past (we write on Tuesday, P. M.) the weather has been variable, with considerable rain. On Friday last we had a heavy shower, accompanied with hail, succeeded by a very cool atmosphere—rendering winter clothing among the essential requisites on Saturday. Sunday was warmer and fairer, but throughout Monday there was a heavy rain, which continued until near Tuesday noon. The skies are now brightening, with a prospect of fair weather for haying, &c.

The rain was propitious, being much needed by the parching crops in many sections, and has not probably proved injurious in any locality.—The crops are coming forward finely. The wheat, however, is being more or less injured by the weevil. We trust the matter is exaggerated, but if rumor says truly the insect is proving very destructive to the crop in Seneca, Ontario, Wayne, and the eastern portion of Monroe.

THE FISHERIES.—The Boston Transcript reiterates, from personal knowledge, a statement which has before been made, that some of our fishing vessels will go out this season armed, and prepared to defend the rights secured to them by the fishery convention.

## Review of Wool Market for June, 1853.

THE clip has been pretty well contracted or bought up, at prices ranging at from 45 to 55c. Where farmers have asked and held their wool for 60 cents, it has been readily obtained. As 65c is the proper value for full blood, it leaves the dealers a very handsome margin. It certainly gives the growers an excellent profit. And it is quite certain that for many years to come wool will bear a high price to what it has borne hitherto.

It hardly seems necessary now to quote any price for Wool, it has been so generally taken out of first hands. Still it is worth as much as it was last month, at least.

INFORMATION WANTED.—Of THOMAS H. M'CRAY, who when last heard from, was at Detroit, Mich., about the 31 of August, 1852, engaged in the business of selling State and county rights for the manufacture of a patent Smut Machine. He was said to have been at Old Jackson, Missouri, some time in September; but as he has not been heard from since he was at Detroit, it is feared he has fallen a victim to some of the diseases then prevalent in the west and north-west. Any information concerning his fate, or whereabouts, if living, will be most gratefully received by a distressed family and a large circle of relatives. Address Mrs. ANGELINE M'CRAY, Hiwassee College, Monroe, Co East Tenn.

☞ All Editors in the North and West friendly to the cause of humanity, will please give the above an insertion in their papers.

ANOTHER NEW TERRITORY—ALHARRA.—The Washington Union contains a communication from Henry R. Schoolcraft, Esq., in which he describes a section of country which is known by the name of Alharra. He says it is an attractive, well timbered and fertile area of country, lying immediately west of the Rocky Mountains, in mild temperate latitudes, to which, for the purpose of distinct allusion, he applies the aboriginal term. The area is about fifty miles broad, and lies parallel to the Rocky Mountains for a distance of several hundred miles. It gives rise to both of the main and numerous sub-affluents of the Columbia river. It is a high plain, which is cut through by these affluents, of a most fertile character, bearing trees, and in some places high grass; and while the streams create abundant water power for lumber and grain mills and machinery, they are free, or nearly free, from inundation of their banks. This district probably comprehends 25,000 square miles, and if its capacities of production have been correctly estimated, would sustain a population greater than some of the Eastern and Atlantic States.

THE ORIGINAL WASHINGTONIANS.—John H. W. Hawkins, in answer to the statement going the rounds that the leader of the Baltimore Washingtonian movement is keeping a low grog shop in Baltimore, gives the present standing of the original six as follows:

"David Anderson, master blacksmith, doing well and accumulating property; John F. Hoss, master carpenter, doing well; James McCurley, master coachmaker, doing well, also accumulating property; Archibald Campbell, silver plater, doing an extensive business; William R. Mitchell, on his own farm seven miles from Baltimore—unfortunately does not keep his pledge; George Coston, died in 1841, a sober man, kept his pledge to the last."

APPOINTMENTS BY THE ADMINISTRATION.—It is said the following number of appointments have been made by the President since the 4th of March:

Foreign Ministers, 10; Charge d'Affairs, 10; Consuls, 7; Commissioner to Sandwich Island, 1; Treasurers, 21; Registers, 67; Receivers, 66; District Attorneys, 34; Marshals, 26; Collectors, 96; Surveyors, 58; Naval Officers, 11; Appraisers, 20; Deputy Postmasters, 207; Surveyors General, 22; Pension Agent, 23; Indian Agent, 30—grand total, 719, exclusive of the numerous appointments by the heads of the several departments.

INTEMPERANCE AND CRIME.—Judge Starnes, of the Middle Circuit, Georgia, in his statistics to Gov. Cobb, concludes as follows:—"In every 100 cases tried, of all kinds, there have been 33-33d cases with which the evidence connected the use of ardent spirits as a cause; or just one-third.—In every 100 cases of crime against the person, there have been 46-16 cases with which the evidence connected the use of spiritous liquors as the cause, by which it appears that nearly one-half of the crime against the person is more or less attributable to spiritous liquors."

COPPER AND GOLD MINING IN VIRGINIA.—A new mining company has been organized, called the Manaes Copper Mine, in Fauquier county, Virginia. The mine is situated on the Blue Ridge, and is seventy miles from Alexandria, and extends over nine hundred acres. The ore yields 24 per cent. of copper, and pyrites 28@30 per cent., while some specimens of the vein have yielded 89 per cent. of pure copper. The ore can be sent to Baltimore for $2 per ton, and to New York for $2,50.—*Richmond Whig.*

A BUG VISITATION.—We learn from an authentic source, that in several of the southern counties of the State the foliage of the forest trees has been, in certain districts, so generally devoured that most of the limbs are entirely stript of their leaves, by a brown bug, which flies at dusk and settles upon them. It is about an inch long, and has nothing peculiar in its appearance. During its flight in the evening, the air is filled with a low, roaring, humming noise.—*Cincinnati Commercial.*

SOMETHING VERY LIKE A MIRACLE.—The *North British Daily Mail* has the following, under the title of "Remarkable Occurrence:"—"A little girl had her left eye so completely covered with a white speck that it was rendered sightless. A few days since, while amusing herself out of doors, a dove descended from a neighboring dwelling house, and, as if in search of food, removed the speck with its bill, without causing the slightest injury, so that ever since the vision of the girl has been perfect."

THE MAINE LAW IN CONNECTICUT.—The Maine law was defeated in the popular branch of the Connecticut Legislature on Thursday. An amendment, striking out all after the enacting clause, and inserting a bill giving town and city authorities power to license, was adopted by the casting vote of the Speaker. The bill, thus amended, was adopted by a vote of 108 to 98.

## News Paragraphs.

☞ A curious fact, illustrating the course of trade, is stated by the Baltimore American, namely, that the steamers of the Parker Vein Company running between that city and New York, and soon to be increased to a *daily* line, *have not yet taken away a single ton of coal*, though built expressly for the coal trade, but are freighted with Western produce and manufactures transported over the Baltimore and Ohio Railroad.

☞ A locust plague appears to be afflicting the people of several parts of Central America. A cloud of these insects had alighted on the territory between Barranca and the Chacarite, consuming the crops; and the Bishop of that region had directed public prayers for relief to be offered up. The locusts had also fallen upon the city of San Salvador.

☞ A letter from Ireland informs us that the great Apostle of Temperance, Father Matthew, is in bad health, and has been since his return from America. The excitement of travel and scenery in this climate, seems to have borne him up during his short but glorious mission, only to prostrate him the more, when removed from it.

☞ There are now eight million dollars in specie, in the New York Sub-Treasury—a greater sum than ever before—and the imports continue to increase. It is estimated that there will be a surplus of $20,000,000 in the Treasury when Congress meets, unless Government makes great sacrifices in buying up the national debt.

☞ No less than 35 deaths were reported in New York, on Wednesday week, at the Coroner's office. Some ten or twelve of them were supposed to be from sun-strokes, and the remainder from casualties, apoplexy, intemperance, exhaustion, and similar causes. The Coroners were only able to attend to about half of the cases.

☞ Last week we saw an eagle's nest in Yates near the county line of Niagara, on the lake shore that had been built for the last twenty years, or as long as the old residents had lived there, which is owned by a large, black, bald-headed eagle, and repaired and occupied annually, undisturbed by any one.—*Medina Whig.*

☞ The consumption of black tea in this country is increasing more rapidly in proportion than green tea. This is a very favorable feature. In Great Britain very little green tea is used, the bulk being black, and we are glad to see a change taking place in the United States. Black tea is less injurious and less expensive.

☞ The fund raised several years since to reconstruct Brock's Monument, on Queenston Heights, some £5,000, has never been appropriated to that object. The shattered shaft remains a monument rather of the rebellion of 1837 '8, than of the heroism of the British General who fell at Queenston.

☞ The report of the sale of Mount Vernon estate is confirmed by the National Intelligencer. The price paid was $200,000, and the remains of Washington are never to be removed. There is a reservation permitting our government to repurchase, should it choose to do so.

☞ The Crystal Palace in London covered 20 acres; that of New York covers two acres and a half. That cost £176,000; this at least $300,000. That occupied eight months in its erection; this has already consumed that space of time, and will not be finished for many weeks yet.

☞ The New Hampshire Legislature consists of 268 members—of which number 132 are farmers, 19 traders, 13 lawyers, 9 manufacturers, &c. The Governor is a physician, who, in his executive capacity, receives (instead of giving it) advice from four farmers and one physician.

☞ There is operation in Maine, 356 miles of railroad, and 85 miles in the course of construction. The New York Tribune says of these roads, that they have been built with our own money, and by our own enterprize, and will contribute mainly to the up-building of our State interests.

☞ A powder mill at Enfield, Ct., was blown up on Thursday, with 1,000 lbs of powder. Walter Luce, a workman, lost his life. All that was found of his remains, was a foot lying some 90 rods from the mill. He leaves a widow who has lost *three* husbands by powder explosions.

☞ The Board of Health of Alexandria report that the cholera, of which there has been seventy-three cases since the 11th of May, has gradually disappeared, and that Alexandria was never freer from disease than at present.

☞ The Palmer Journal says Franklin Morgan, of that village, has a pair of twin cows, four years old, which have been worked in the yoke like oxen for a year or two. They are large, good looking animals, and are milked the same as his other cows.

☞ Garrett N. Bleecker, of New York, and recently deceased, mentioned in his will the Madison University to the amount of $12,000. He was one of the original subscribers to the endowment of the University, and subscribed $3,000 for that purpose.

☞ The Canadian Parliament has passed a law making the Legislative Council elective, and abolished the property qualification for Members of Assembly. Our neighbors are progressing toward democratic customs quite rapidly.

☞ Eight persons were sun struck in New York city, on Tuesday week—two of whom died, and others were not expected to recover. Four others, likewise laborers, were sun struck at Staten Island, one of whom died.

☞ Mayor Wilson, of Montreal, has left the city—public opinion condemning him as the one who gave the troops the order to fire. Alderman Atwater, a native of Vermont, has been elected Mayor *pro tem.*, by the Common Council.

☞ It has been decided to have the next New Hampshire State Fair held at Manchester, on the 5th, 6th, and 7th of October next. Manchester gives $700 on condition of its being held in that city. Concord offered $500.

☞ At the tea and strawberry gardens, Seedley lane, Pendleton, England, a woman is now engaged in walking 1,000 miles in 1,000 hours, for a wager of £500. She walks in the Bloomer costume.

☞ The Vermont Whig State Convention nominated for Governor, Erastus Fairbanks, of St. Johnsbury; for Lieutenant Governor, W. C. Kittridge, of Fair Haven; for Treasurer, George, Howes, of Montpelier.

☞ Ole Bull returned a short time since, to his settlement in Potter county, and found persons vending ardent spirits, which he immediately suppressed. That is right, and he will thus do much for the prosperity of his colony.

☞ Hon. HENRY VAIL, of Troy, died on Saturday last, aged 70. He was formerly a member of Congress, and has filled other import public stations.

## News Brevities.

—— Thomas F. Meagher is lecturing in Maine.

—— Fanny Fern has become a resident of New York city.

—— A serious drought is prevailing all through North Carolina.

—— Mrs. Catherine Sinclair is still performing at San Francisco.

—— Rev. Dr. Sharp, of Boston, died in Baltimore on the 23d ult.

—— The Maine Law has been adopted in Michigan by a large majority.

—— The cholera and yellow fever have both appeared at New Orleans.

—— The village of Owego is building a village Hall at an expense of $4,500.

—— Gov. Dorr is named for chief justice of the supreme court of Rhode Island.

—— Charles Dickens has announced that he is writing his own autobiography.

—— Judge Chambers, one of the ablest of the Mississippi judges, died recently.

—— The Maine Law Bill was defeated in the Connecticut Legislature, 108 to 98.

—— The "Spraker Bank" has been organized at Canajoharie. Captail $100,000.

—— Lola Montes is advertised to appear at the American theatre in San Francisco.

—— Counterfeit $10 bills on the Bank of Cape Fear are in circulation at the South.

—— The next Commencement of Hamilton College, Clinton, will be held July 27.

—— Bank notes under $5 cannot be circulated in South Carolina after the 1st of July.

—— Hon. Freeborn G. Jewett, Judge of the Court of Appeals, has resigned his seat.

—— Rain fell at Augusta, Ga., on Monday, week, for the first time since early in April.

—— Ten slaves recently escaped from Newport, Ky., and have thus far eluded pursuit.

—— Daniel S. Dickinson is announced to delivered an oration at Syracuse, on the Fourth.

—— Mrs. Stowe has become a patroness of the Distressed Needlewomen's Society in England.

—— The railroads between Cleveland and Toledo are to be consolidated on the first of Sept.

—— J. D. Husbands, Esq, of this city, is to deliver the Oration at Lyons, Wayne Co., on the 4th.

—— Wm. Boltwood, of Amherst, Mass., has a cow whose live weight, the past week, was 1,474 pounds.

——A mud-turtle, weighing 45 lbs., was fished up in Lake Winnipisseogee, the other day, by a couple of boys.

——Great Britain has withdrawn its suit against South Carolina for the imprisonment of a colored British seamen.

—— The revenue of Peru is eight millions of dollars, of which five millions are derived from the sale of guano.

—— Victor Hugo is said to be writing a book "that would make a statue wince," against the Bonaparte regime.

—— At a recent Fair held for the benefit of the Catholic Orphan Asylum at Brooklyn, the sum of $6,000 was realized.

—— The navigation of the Canal on the long level, between Utica and Syracuse, is much impeded by low water.

—— Raspberries were for sale in the Cincinnati market on the 11th ult. They found ready purchasers at $1 per quart.

—— Judge Hiram Denio, of Utica, has been appointed Judge of the Court of Appeals, in place of Judge Jewett, resigned.

—— On the 19th of March a Chinese theatre at Whampoa was destroyed by fire, and sixty females perished in the flames.

—— The 4th of July is to be celebrated in Boston by a grand military and civic procession, and a display of fireworks at night.

—— On Sunday last, the steamboat Wayne, running on Newbern River, blew up, killing four men and one woman, all negroes.

—— M. Felix, the coiffeur of the French Empress, is never allowed to attend on her except in full court dress, sword included. Ah!

——The U. S. steamer Princeton has been ordered to the Fishing Grounds, and will take her departure from Norfolk in a few days.

—— The Hon. W. H. Seward has accepted an invitation to deliver the annual Address before the American Institute in October next.

—— It is said the Administration will protest against the threatened manumission of the slaves in Cuba, and the substitution of Coolies.

—— Gough, the eloquent temperance lecturer, is going to England. He sails about the middle of July. Mr. G. is a native of England.

—— A negro in Baltimore laid a wager that he could eat ten baskets of strawberries, accomplished the feat, and died immediately after.

—— Gen. Garland and Maj. Fry left St. Louis on the 14th, with a detachment of troops, in the steamer Polar Star, en route for Santa Fe.

—— Rev. Dr. Scott, president of Washington College Pa., has already obtained subscriptions amounting to $30,000 towards its endowment.

—— Grant Thorburn, Esq., of New York, well known as "Laurie Lodd," aged 81 years, was married a few days ago to a young widow of 27.

—— The Free Church of Scotland is sending forth to Australia, seventeen ministers, for each of whom, applications have been received from the Colonists.

—— The Sioux and other adjoining tribes have consented to sell their lands and move further up the Minnesota River. This will open a new and large field for emigration.

—— The receipts of Western produce at Ogdensburgh, since the opening of navigation is:—Flour, 88,925 bls.; Wheat, 85,227 bush.; Corn, 55,509 bush.; Pork, 2,583 bls.

—— The Delaware Co. Express says the corps of Engineers surveying the Newburg & Syracuse route have disbanded; and no further surveys on that route will probably be made.

—— A late French paper says:—"The evening train to Havre on Saturday carried away from Paris 985 Hanoverians, who are about to found a town in the State of Illinois, in America."

—— The Principals of the Common Schools in Cleveland receive $1,000 per annum, and the female assistants from $5 50 to $6,00 per week.—Right—competent teachers should always be well paid.

—— An old female miser died at Richmond a few days ago, and on searching her premises, it is said that $800 in specie and $9,000 in bank notes, many of them ruined by worms and bugs, were found.

# Foreign Intelligence.

## Arrival of the Baltic.

THE U. S. steamer Baltic left Liverpool June 12, at 3 P. M., and arrived at New York on Sunday last, the 26th inst.

The Africa arrived out on Sunday, the 13th.

The news is interesting in Turkish affairs.—Liverpool Cotton Market active, partly improved by the Africa's news, partly by the cleaning up of Eastern cloths, and in a measure by considerable purchases of lower grades on speculation.

Breadstuffs are a shade easier, without much change.

It is certain that the Eastern question presents a more cheering aspect than before, and the alarm caused by the hostile pretensions of the powers has considerably diminished.

It is stated that despatches have been received in Paris, containing assurances of the Czar's unwillingness to do anything to disturb the peace of Europe, and of his anxiety that difficulties between him and the Porte shall be settled without any appeal to arms.

It is said that the delay already granted of eight days has been extended to fifteen, in order to afford sufficient time for negotiation.

Advices from Trieste of the 28th, state that the French, English and Russian army, are actively employed in taking measures of defence.

The Russian fleet at Sebastopol, consisted of 13 ships of the line, 8 brigs, 6 corvettes and 12 smaller vessels, all well armed and equipped, but the fleet was deficient in steamers.

The governments of France and England have decided that their united squadrons should, without delay, approach the Dardanelles.

LIVERPOOL MARKET.—In the British market held on the concluding days of this week, the trade in general was reported more active. Wheat as well as other leading articles, were higher in value

In several parts of Ireland, the demand for wheat, oats and flour, it was stated, had increased firmness.

GRAIN—Rather upward tendency. Indian corn noted somewhat lower.

From Richardson, Bros. & Co.'s Circular we have as follows:

Since the 10th we have had some severe rains, with intervals of fine weather. Our grain and grass crops are making rapid growth. A steady, firm trade in wheat and flour. But the transactions the last few days have been small. The demand for Indian corn has been on a trivial scale We had a thin attendance at our market this morning. There is still a less number of buyers The weather being extremely hot, the demand for wheat was slow.

Flour moved off slowly at 25s per bbl. for Philadelphia and Baltimore, and even at that figure but a small trade was done. No. 1 Western met a similar result at 24s 6d,

Oat meal dull — sales at last mentioned prices No transactions in cargoes of wheat and corn

The Colonial wool sales closed on the 4th. 41,500 bales sold, principally for consumption on the spot. Prices firm throughout, and tending against buyers.

The market for English securities opened firmly on the 13th inst., being quoted at 95⅝@98¾

The feeling predominant to-day (the 14th) throughout the city in consequence of the Turkish question, has been one of increased confidence, and the tone of the markets has been one of increased confidence. Consuls at 9⅝@98¾.—Bank stock has been dealt in at 2,23½@2,29½

# California News,

## Arrival of the Crescent City.

The Crescent City, from Aspinwall, arrived at New York on the 22d ult., bringing California papers with dates from San Francisco to the 24th of May, brought down to Panama by the Republic.

Among the Crescent's passengers were several returned Australians, whose reports of the gold prospects are exceedingly favorable.

The Crescent City brings $330,000 in freight and $100,000 in the hands of passengers. Mr. Eggs, U. S. Consul at Accupulco, died May 16th, of brain fever.

The difficulties between Peru and Bolivia are increasing and the government is sending troops to the southern frontiers to cut off the supplies of the latter. The enemies of Bolivia are also collecting a large force. The Chilian Minister had been expelled from Bolivia. The U. S. Charge is now the only official near the Government. The affairs of Bolivia are at a crisis.

The news from the mines are of a more favorable character. The yield promises to exceed that of any former season. Agricultural prospects are very fine and the crops will be abundant. The Legislature adjourned on the 19th. Gov. Bigler has been authorized to go in pursuit of a band of robbers. A heavy snow had fallen in Placerville. A miner had deposited in a bank in San Francisco $30,000, the proceeds of his labor for 10 or 12 months.

MARKETS.—Business inactive during the week Large demands from the interior and from Oregon. Prices are depressed and tending downwards, with accumulating stocks. Flour $11 25@11 50. Mess pork $23 per bbl. Bacon 23@24c. Butter 25c. Hams 17@20c.

OREGON.—Dates from Oregon are two weeks later. The miners in South Oregon are doing well. Provisions are plenty and low.

THE WEATHER AND ITS EFFECTS.—We learn from our exchanges, and by the telegraph, that the heat during the last few days has been as intense and oppressive in other parts of the country, as it has been with us. Its effects in producing death have also been very remarkable. We do not remember of ever before having heard of so many cases of *Coup-de-Soleil* within such a short period of time. By reference to our city intelligence, it will be seen that there were seventeen deaths in this city on Wednesday, arising from strokes of the sun. On the same day there were seven deaths in Brooklyn, and two in Williamsburg, from a similar cause. Also twelve in Philadelphia, and eight in Baltimore. If the summer should continue as it has commenced, the most careful sanatory regulations will be required to keep this city free from sickness.—*N. Y. Courier.*

OLE BULL'S NORWEGIAN COLONY of 140,000 acres in Potter county, Pa., is said to be highly prosperous. The principal town, called Oleana, already contains a population of 700. Ole Bull has built himself a beautiful Norwegian cottage for a summer residence, and proposes to establish a polytechnic school in his colony for the advancement of the arts and sciences generally, to be conducted by the most scientific men of Europe.—His plan is to make it a civil and military school, to be open for the youth of the Union and to connect the sciences with the arts.

TEA-CULTURE.—The Rochester American says that a gentleman who has carried on both the cultivation of the tree and the manufacture of a tea from their leaves for years, and some of the time employed two hundred men at the work, has left that place, after an extensive examination of the soil and climate of the South, for China and the East Indies, expressly to import a stock of young plants, superior in every respect to those cultivated by the late Dr. Junius Smith, at Greenville, South Carolina.

RICH CARGO.—The propeller Globe brought down from the Sault on her last trip 208 tons of mass copper, 127 tons of which were left at the Detroit Smelting Works. The Tribune states that some of the masses of pure copper weighed 4,000 pounds, and the whole cargo would average more than 75 per cent. The weekly value of copper now coming down from the California of Michigan, is not less than $100,000, and it will continue to average that figure for some weeks to come.

CRYSTAL PALACE.—The following are the present outside attractions of the Crystal Palace, all of which appear to be doing a thriving business: Mlle's bronze statue of General Jackson; the Washington circus; a California menagerie; a man without arms, who writes to please the curious; a Rocky Mountain ox with six legs, and a pig with two bodies; flying horses for the amusement of children; a live alligator; the largest oxen and sheep ever seen by man, &c.

TERRIBLE ACCIDENT AND LOSS OF LIFE.—This afternoon, about two o'clock the roof of the old Masonic Hall, in process of demolition, in Chesnut st., above Seventh, fell in with a tremendous crash. A number of workmen were engaged in it, and many were buried in the ruins. Three bodies were very soon taken from the ruins, and it is feared that as many as ten lives have been lost.—*Philadelphia Bulletin* 23d.

THREE LEGGED CALF.—Mr. R. Barrett, in Addison, Vt., has one of Nature's wild freaks—a calf with but three legs. One of the forelegs is entirely absent; no dwarf leg or anything that shows the commencement of formation. The most amusing thing is its ability to run, jump, and kick up its heels, with the ease and freedom of the most perfect animal.

THE PUBLIC LANDS.—Recent statistics show that while we are pushing and striving for more room, we have more than a thousand million of acres that we never use. The total amount of unsold and unappropriated lands in all the States and Territories is 1,387,534,001 acres, or more than fifty acres apiece for every man, woman and child in the Union.

NEW COUNTERFEITS.—$50's on the Buffalo City Bank altered from two's. The two's in the corners are erased and $50 inserted in place. It is coarsely done and easily detected.

$10's on New Haven Bank. Counterfeits are very plenty. Also $20's on the Farmers' Joint Stock, Toronto.

VENERABLE.—There is a man in New Bedford, Mass., an Irishman, lately arrived in the country who is one hundred and four years old. He enjoys tolerably good health, and walks about the streets with considerable vivacity. His children, who are able to maintain him, sent for the ancient Hibernian.

SERIOUS LOSS.—The Ogdensburg Sentinel learns that a passenger train of the Rutland and Burlington Railroad, on Friday night, just below Burlington, ran over a flock of imported sheep belonging to Jewett & Morse, of Shelburn, Vt., killing 50, valued at $10,000.

☞ Last winter was the hardest ever known in Oregon. Cows and chickens were frozen to death; ten thousand cattle died for want of food as fodder is never saved. Wheat was $8 a bushel and oats $5.

# Market Intelligence.

RURAL NEW-YORKER OFFICE,
Rochester, June 29, 1853.

SINCE our report of last week, there has been no exciting cause to give additional stimulus to the market, and transactions have been confined to the usual routine, and have been for the most part quite limited. Farmers are very busy with hoeing, which is late, and will continue up to time for haying, without leaving the accustomed week for fishing. Every department of trade presents a healthy attitude, with renewed prospect of continued prosperity

FLOUR—Just after our paper went to press last week, the foreign advices were considered more favorable, and an advance was anticipated, but at present dates the news is unfavorable, and a decline may be looked for. No change in prices in our market, which is brisk and firm.

GRAIN.—Very little wheat comes forward, and we hardly believe there is much, in large parcels, in the hands of farmers. Good Genesee readily commands $1.17@1,18, which may be considered the market value. Corn is in active request at 63@65c. Oats not plenty at 42@44. We hear of no sales of Barley.

PROVISIONS—There is little doing in provisions. Pork remains unchanged, and finds sale only in small parcels for immediate use. Potatoes are plenty at 20@25. Butter sells at 12½c. Eggs 11@13 with moderate supply of fresh. Poultry is scarce and much in demand. Early chickens rule high.

MARKET SUPPLIES—Still fed beef is not very plenty, and sells at $5,50@6,50, as per quality. The price is affected unfavorably by the grass beef butchers are able to obtain, and which costs less. Lambs are not plenty and bring from $1,50@2 each.

HAY is less firm, and hardly sells at our quotations, as the smell of new mown hay is among us.

WOOL—The market is very quiet, with little competition among buyers. The amount coming in is light. There has been no decline since last week, the better qualities coming fully up to 55c. We see no indications of a permanent decrease in price.

| | |
|---|---|
| Common, | 36@38c. |
| ¼ blood, | 40@42c. |
| ½ do. | 45c. |
| Merino, | 50c. |
| Saxon, extra, highest | 55c. |

### Rochester Wholesale Prices.

| | | | |

# Marriages.

In this city, on the 21st ult., by B. Bardwell, Esq., Mr. GEORGE W. COON and Miss SARAH E. DEWEY, both of Manchester, Ontario Co.

## GARDEN OR FIRE ENGINE.

THE Subscribers manufacture, and furnish to order, a Garden or Fire Engine, which for its power, capacity and usefulness cannot be surpassed. From the size of the Air Chamber, sufficient power is obtained to enable one man to throw a steady stream of water to the height of 50 feet perpendicularly, thereby rendering it a desirable article as a protection against fire, for washing windows of second and third stories of buildings, carriages, &c. With our newly invented Water Diffuser, as a Garden Engine it defies competition: the Diffuser is a perfect and simple article, (which we intend to get patented,) and its superiority over the Rose Sprinkler, is that it will throw four times the quantity of water a much greater distance, and spread it perfectly even, with less power applied.

N. B.—A Garden Engine with a Diffuser of the above description, used in orchards and gardens, to throw soapsuds on the young trees, will destroy many kinds of vermin likely to destroy the fruit, and be an invaluable addition to the implements of the nurseryman and horticulturist. COWING & CO.

Seneca Falls, N. Y., June, 1853. 183w10

## REAPING MACHINES.—IMPORTANT INJUNCTION.

JUDGE NELSON, of the Supreme Court of the U. S., granted at Cooperstown, on Friday, the 24th ult., an injunction against SEYMOUR & MORGAN, of Brockport, restraining them and their agents from disposing of their wheat Reapers as an infringment of my patent. Purchasers of machines make themselves liable to prosecution by using them. C. H. McCORMICK.

☞ Mr. McCORMICK has recently obtained a renewal of his patent, including the reel. Manny's Reaper is as decided an infringement of his patent—subjecting the manufacturer and purchaser of it, to the same penalties.

June 29, 1853. 183tf.

## A WESTERN FARMERS' PAPER!

### Farmers' Companion & Horticultural Gazette.

PUBLISHED Monthly, in Detroit, Mich., on 16 extra large octavo pages, with numerous superior *Engravings*,—edited by C. FOX and C. BETTS, J. C. HOLMES, Horticultural Editor; LINUS CONE, Corresponding Editor,—is peculiarly devoted to the interests of Western Agriculture and Gardening. The rising interests of STOCK RAISING and WOOL GROWING, will be particularly attended to—As the Editors are all practical men, and old residents in the West, they believe they can afford much valuable *practical* information, and assist materially their brother farmers in their business; especially those who have lately immigrated, or intend to do so.

### Price, only Fifty Cents a Year.

☞ The celebrated Prof. J. F. W. JOHNSTON, F. R. S. L. & E., the great Agricultural Chemist of England, has promised to contribute during the year.

Specimen numbers sent on application. A liberal commission to agents. Advertisements are confined to the cover so as not to interfere with the reading.

Direct to CHAS. BETTS, Detroit, Mich.

## E. Boughton's Thistle Digger and Subsoil Cultivator!

THE Thistle Digger and Subsoil Cultivator is, owing to its peculiar construction, particularly adapted to pulverizing the soil and destroying all thistles, noxious weeds and grass. It will work in any soil, the harder the better. It is so arranged that the blade may be raised and lowered, and made to move the soil to any required depth, and by cutting up every thing in its way, has a decided advantage over the Wheel Cultivators whose use it is fast superceding.

The following gentlemen, who are all practical Farmers, have used the Thistle Digger and Subsoil Cultivator on their farms, and cheerfully concur in recommending it.

Price, $30. Orders solicited, which may be directed to E. BOUGHTON, at Pittsford, or to BRADLEY & ROMANS, (who are the manufacturers,) or GUY COLLINS. East Bloomfield, N. Y. 183w4.

## THE JUVENILE INSTRUCTOR,

BY UNCLE LUCIUS, Syracuse.

A SEMI-MONTHLY PAPER, expressly for children It aims to attract their attention by simplicity and beauty of style, and to infuse into the young mind appropriate sentiments of piety and love for parents—sympathy for human suffering, and an abiding hatred of oppression to all its forms. It ought to be circulated over the entire Union, for this last reason. There is much at stake in the question of freedom, and but little said or done to effect favorably the youthful mind. Within the State of N. York, the postage is 6 cents per year, paid at the office where it is received In all other States, 12 cents yearly. In packages of 24 or more the postage, if pre-paid at the office of publication, is about 1cts on each paper.

Price per year—single copies, 25c.; Five to one address, $1; Ten do, $1.70. Twenty do, $3; Thirty do, $4,20; Fifty do, $6,50; One hundred do, $12.

Address LUCIUS C. MATLACK,
183w3. Syracuse, N. Y.

## Valuable Farm for Sale, in Lockport, N. Y.

ABOUT 200 acres, just south of the Village line, fronting on a Plank Road, with orchard and all requisite buildings, and belonging to ELON BALUSHA, of whom inquire by letter or on the premises. It is steadily enhanced in value by the rapid rise of adjacent village property, and is offered wholly, or in parts to suit. Most of the money can remain on mortgage. 183-3t*

## THE TIME OF DAY.

*New and Splendid Jewelry Store, just opened, with a New and Superb Stock of Goods, etc.*

JACOB PICARD, begs most respectfully to inform the public, that he has just opened the new, splendid and capacious Store, under the American Hotel, No. 95 State street, corner of Mumford street, Rochester, with an entirely new and superb stock of modern goods, recently imported or selected from the largest manufactories in New York, &c., in Watches, Jewelry, Clocks, Silver and Plated Ware, &c., which he is prepared to sell at prices lower than any other establishment in Western New York.

Those wishing to purchase will find at this Establishment an extensive variety of all kinds of goods to select from, all of which are of the best quality, and at the lowest prices.

J. P.'s stock consists of Gold Watches, from $25 to $225, warranted for one year. Silver Watches from $9 to $50; also warranted for one year.

Ladies' and Gentlemen's Jewelry, in immense variety, and combining all descriptions.

A large assortment of Clocks, from 1 day to 21 days' time, and from $1 50 to $75.

Mr. P. has constantly engaged, two workmen of considerable experience at Watch, Clock and Jewelry Repairing Watches cleaned and kept in order by contract.

Buyers, remember the address:—JACOB PICARD, Watch Jewelry and Clock Establishment, No. 96, corner State and Mumford sts., Rochester 179-tf.

## GREAT STOCK SALE.

### Short-horn and Durham Cattle, and South-down Sheep.

ON Wednesday, the 7th day of September next, at one o'clock, P. M., I will sell, at my farm on Grand Island, six miles below Buffalo, about 30 full bred Short-horns a few Devons, and about 30 high grade Short-horn and Devon Cattle, consisting of Cows, Heifers and Young Bulls.

The young Short-horns are chiefly the get of my imported bull Duke of Exeter (10,152)—a bull not exceeded, as a fine stock getter, by any other in the U. States.

The young Devons are the get of the bulls Candy and Quartley, both imported by Mr. STEVENS. The superior of these bulls in blood, style and breeding, is not to be found. Quardley is my present stock bull.

I will steer at the same time 50 pure bred South-Down sheep-rams and ewes Also a few Middlesex pigs—both sheep and pigs the direct get of imported sires, from dams descended from late importations.

Catalogues will be ready by the first of August, and will be sent on application to me, by mail.

TERMS:—All sums of $100, and less, cash. For large sums, approved notes at four months, with interest, payable at Bank, will be received, if preferred.

A steamboat will carry all persons wishing to attend, across the ferry from Lower Black Rock to the farm, at 11 o'clock on the morning of the day of sale. The stock can be viewed at any time previous, by calling on me at my residence in this place. LEWIS F. ALLEN.

Black Rock, N. Y., June 15, 1853. 182-10t

## ATKINS' SELF-RAKING REAPER.

THIS MACHINE is now offered to the public and warranted to be a good Self-Raking Reaper. It is also believed to be a good mower, but not yet having been sufficiently tested in grass (though it soon will be) it is not warranted to be equal to a machine made mainly or wholly to mow.

The raking apparatus is of novel and very simple construction, and not liable to derangement, and every farmer who has seen it in the harvest field, says it performs the raking better than a man can possibly do it.

Price of machines at Chicago, $175, of which $75 must be paid on giving the order, $50 upon successful trial, and $50 in note payable 1st Dec.

The machines are most thoroughly built and warranted.

☞ Descriptive circulars, with cuts, sent to post-paid applications. [182m3.] J. S. WRIGHT.

"Prairie Farmer" Warehouse, Chicago, June, 1853.

## SUFFOLK PIGS FOR SALE.

TWENTY PAIRS of pure bred *Suffolk Pigs* for sale by the subscriber. They can be safely forwarded by Railroad, Express, &c., to almost any part of the country.

Address C. J. HOLDEN,
June, 1853. [182-2t*] Walpole, N. H.

## PREPARED SUPER PHOSPHATE OF LIME,

BY THE UNION CHEMICAL WORKS, L. I.

HOYT & CO., Agents,

*No. 234 Water Street, and 122 West St., corner of Dey St., NEW YORK.*

A FERTILIZER of the most approved quality, producing all the immediate effect of the best Peruvian Guano, with the advantage of being much more lasting in the soil.—Thoroughly tested, and found to more than realise the expectations of all those who have already tried it. The best evidence of this is the largely increased demand this season over the past year. Put up in bags of 160 lbs; barrels 250 lbs each. Buyers will please be particular to observe our brand upon each bag or barrel.

Also for sale, American and Foreign Field and Garden Seeds. English Ray Grass, Foul Meadow Grass, fine mixed Lawn Grass, White Clover, Osage Orange, &c.

178m3i.

## DRAIN TILE MACHINE.

THE Subscribers are manufacturing at their machine shop, at North Bloomfield, Ontario Co., N. Y. Machines of an improved pattern, and most durable construction, for the use of moulding drain tile, bats for crocks, &c.

Orders by mail or otherwise, punctually attended to.

FAIRCHILD & WOOD.

North Bloomfield, N. Y., April, 1853. 173-3toam

## ROCHESTER STEREOTYPE FOUNDRY.

THE undersigned would respectfully inform the public—and especially book and periodical publishers, authors, &c.—that he has established a STEREOTYPE FOUNDRY in Rochester. His establishment is furnished with every facility for Stereotyping, in the best manner, Books, Pamphlets, Periodicals, Cuts of all kinds, (including figures of animals, implements, etc.) Patent Medicine Advertisements, &c., &c. Plates blocked in a superior style on mahogany. All work executed with promptness and on reasonable terms, and equal in style and finish to that done at any other Foundry in the country.

An establishment of this kind has long been a desideratum in this city, and now that one is in operation, it is hoped a liberal share of patronage will be awarded to the enterprise.

☞ Foundry in Talman Block, Buffalo street. All orders from a distance may be addressed to

J. W. BROWN,
April, 1852. [122-1am-tf] Rochester, N. Y.
N. B.—Old type taken in exchange for work.

## FIRST PREMIUM REAPER.

AT the great Trial of Reapers in the Harvest Field at Geneva, N. Y., in July last, the BURRALL REAPER, in competition with eleven others, was awarded the

### FIRST PRIZE OF FIFTY DOLLARS!

and also a DIPLOMA by a Committee of twelve, appointed by the New York State Agricultural Society. The Committee, in their Report, remark, that "T. D. BURRALL'S machine performed its work in the *most admirable* manner; the gavels were well laid; the *workmanship* and *materials* were *excellent*; the *circular* apron for side delivery, the *balance wheel*, and an arrangement to elevate the exterior edge of the apron, are valuable features," &c., &c.

During the last two years a large number of these Reapers have been in use, giving entire satisfaction in all cases. This cannot be said, in truth, of any other Reaper. We have received letters from more than fifty practical Farmers of Western New York, who have purchased and used this machine, and all speak of it in the highest terms of approval—pronouncing it *superior to any other* that has come under their observation. We have published the larger part of these letters in a hand-bill which we would be pleased to furnish any who may apply either by letter or otherwise.

☞ This Reaper has no band-wheels, pullies, straps, or harness of any kind to get out of order, as is the case with other Reapers: but, on the contrary, it is simple and compact, being made of few parts, well arranged, and each part having its proper relative strength—consequently, it is durable. Its draft is light, and the grain is delivered from it with ease, and in nice order for binding. In all these respects it is superior to any other Reaper. It also struck the Committee at the great trial at Geneva, and occasioned them to remark in their Report, that "it performed its work in the *most admirable manner*, and that the *gavels were well laid*," &c., &c.

The cutting of wheat, barley, oats, rye, buckwheat and seed clover, is so important to the farmers of grain growing districts that they should see to it, that they do not get forced upon them a second or third rate machine for these purposes. No small consideration, at least, should induce them to have any thing other than THE BEST. But how shall it be determined which is best, when manufacturers and agents each, assert the machine in which he happens to be particularly interested, to be the best? Under this state of things the question should be determined in favor of that machine, the manufacturer or agent of which can produce the largest amount of reliable evidence of its superiority. Interested persons are not always to be trusted, but generally disinterested persons are. Well, then, who can produce the best and most evidence from the class which is reliable? We claim that we can; and we will begin by reasserting that a Committee of twelve disinterested persons, after seeing all the Reapers of any note at work side by side, which was the greatest test ever had, pronounced the Burrall machine the best. *They* did not call any other best.

We also say that of all the Burrall Reapers sent out not one has been returned. All have given the most entire satisfaction, and in most cases have far exceeded the expectations of purchasers These assertions cannot be made, in truth, in reference to any other Reaper. We are therefore, willing to leave the question, which is best, to be settled by the *disinterested*; and we would say, inquire of those of that class who have knowledge on the subject, and also examine the different machines for yourselves, and if you do not become convinced that ours is the most simple and durable—that it will cut when driven either slow or fast—that it will cut green or grassy wheat—that its draft is comparatively light—that the grain can be got off from it with ease and in nice order for binding—then don't purchase this Reaper; but if you find it equal in all these good qualities, and far superior in many, to any other Reaper, then those who have not already done so, will please hand in their orders as early as possible, either to our agents or ourselves. This will enable us more fully to supply the demand.

The undersigned have the *exclusive* sale of the Burrall Reaper in the State of New York, west of a line passing north and south through Canandaigua,—and those therefore, who desire to purchase will please hand their orders to either ourselves, or our authorized agents, who will make sales on equally as favorable terms. We also have the right of selling machines for use in any of the States and the Canadas.

[181-3t] BRIGGS & BROTHER,
June, 1853. 68 State st., Rochester, N. Y.

## M'CORMICK'S PATENT REAPING AND MOWING MACHINE!

WITH the advantage of large experience, for many years, in the exclusive business of making and selling these machines, I have during the last harvest, and since that time devoted much time and expense in experimenting to perfect my machine as a reaper and mower, and am now prepared to warrant this machine superior to every other as a reaper and as a mower. The attention of Farmers is called to the following Improvements for 1853:

1st. Iron Beam for combined machine, which allows the grass to pass over more freely, together with improvements in the fingers.

2d. A *self-adjusting* arrangement for mowing, by which the beam rises and falls, and thus accommodates itself to the inequalities of the ground, which is very important for mowing, though entirely unnecessary for reaping.

3d. Very fine cut sickles for grass. These improvements insuring the perfect performance of the mower.

4th. Shortening the platform and placing the raker closer to his work in reaping.

5th. A new and beautiful arrangement by which the machine may be raised from the ground to any desired height in five minutes time, with the main wheel enlarged.

From the well known reputation of my machine, in the hands of more than 7,000 farmers, in this country, and that it has maintained its high superiority, wherever it has been fairly tested. Having AGAIN, after a series of trials at the last harvest in England, and after a contest with Hussey's, in a trial of nine days, upon the Royal Agricultural farm, which was the most extended comes ever made with Reapers in any country, been declared by that able jury of English farmers (see their report in my hand-bill,) decidedly the best machine, capable of cutting when the grain was green or ripe, wet or dry, in all weather when Hussey's could not be worked.

The verdict was that McCormick's machine is entitled to general patronage, that it was considered next to perfect in principle, such as good cutting at any pace of the horses; proper delivery at the side, and economy of both horse and man labor—an implement that might be depended upon for a harvest by any farmer. Further testimonials of its superiority can hardly be necessary.

To convince such responsible farmers as are in doubt, which is the best machine, and of my entire confidence in the superiority of my own, I will permit them to take one of mine, with one of Hussey's or Burrall's on trial, to keep the one preferred.

That Manny, Seymour & Morgan, and others, who are making and selling my machine, *in a changed and injured form*, with the hope of being able to avoid the responsibility of infringing my patent, is the best evidence of the superiority of my machines. They will all be held responsible, and their infringements arrested as soon as the law, which is sure, can have its course. Those purchasing and using their machines, become jointly liable with them.

The purchaser of the Reaper and Mower will save $85 of the expense of a Reaper and Mower if purchased separately. The machines will be forwarded to any part of this State or Canada, if ordered in season of THOMAS J. PATERSON, General Agent, Rochester, N. Y.,—office No. 6 Burns' Building—subject to freight from Buffalo. Price $110 cash; or $115, $30 payable on delivery, and the balance on time, and $25 cash addition, or $30 on time, for mowing attachment. A Reaping machine alone, an excellent article, can be had for $100 cash or $105 on credit, for which mowing attachments will be furnished next year. C. H. McCORMICK.

June 15, 1853. 181tf.

## PROF. BROWN'S NEW STORE,

### With New Goods, and Enlarged Accommodations

CITIZENS OF ROCHESTER and Surrounding Country:—Grateful for past favors, I hope for a continuance and increase of the same. The front part of the store is exclusively for the sale of Goods; the rear for Shaving and Hair Cutting; the basement is a private room, divided into two, for the purpose of Coloring the Human Hair.

GENTLEMEN'S FURNISHING GOODS.—Every article in this line. Collars of the latest make, and a larger stock than can be found elsewhere in this city.

HAIR WORK of every kind—the largest assortment made from the best materials, and shall be sold at the lowest prices. Perfumery, of my own and foreign make. Hair Oils that cannot be excelled. Brown's Antispassis and Hair Restorative, a well known article. Brown's Liquid Hair Dye, the best in the world.

A variety of Useful and Ornamental Articles too numerous to mention, at retail, but which I respectfully invite the public to examine.

FISHING TACKLE.—Sportsmen, call and see.

TO LADIES.—A lady will be in attendance in the front Store.

☞ Eight Chairs are kept in this establishment, giving that number of persons a chance to be shaved at once—Nine persons are employed, showing the popularity and success of the proprietor. PROF. BROWN,

[129-tf] No. 26 Buffalo St., Rochester, N. Y.

## DAGUERREOTYPES.

THE Subscriber continues the business of Daguerreotyping, at his old stand in Chappell's Block, 82 State-st. Grateful for past favors, he will, as heretofore, adhere to the motto, that "whatever is worth doing at all, is worth doing well,"—trusting therein for a continuance of public patronage. Pictures copied, and all other work done in the highest style and finish known to the Art.

Rochester, Jan., 1853. [162-oam] S. B. SMITH.

Oh! say, can you see, by the dawn's early light,
What so proudly we hail'd at the twilight's last gleaming?
Whose broad stripes and bright Stars, through the perilous fight,
O'er the ramparts we watch'd, were so gallantly streaming;
And the rocket's red glare, the bombs bursting in air,
Gave proof through the night that our flag was still there.
Oh! say, does that Star Spangled Banner still wave,
O'er the Land of the Free, and the Home of the Brave?

On the shore dimly seen, through the mists of the deep,
Where the foe's haughty host, in dread silence reposes;
What is that which the breeze, o'er the lowering steep,
As it fitfully blows, half conceals, half discloses?
Now it catches the gleam, of the morning's first beam,
In full glory reflected, now shines on the stream.
'Tis the Star Spangled Banner, oh! long may it wave,
O'er the Land of the Free, and the Home of the Brave.

And where is that band, who so vauntingly swore,
That the havoc of war and the battle's confusion,
A Home and a Country shall leave us no more?
Their blood hath washed out their foul footsteps' pollution.
No refuge could save, the hireling and slave,
From the terror of flight, or the gloom of the grave.
And the Star Spangled Banner in triumph shall wave,
O'er the Land of the Free, and the Home of the Brave.

Oh! thus be it ever, when Freemen shall stand,
Between their loved home, and the war's desolation;
Blest with vict'ry and peace, may the Heaven rescued land,
Praise the Power that hath made and preserv'd us a Nation.
Then conquer we must, for our cause it is just.
And this be our motto, "In God is our trust;"
And the Star Spangled Banner in triumph shall wave,
O'er the Land of the Free, and the Home of the Brave.

# Rural Sketch Book.

## THE LAST OF THE MAGICIANS.

In the early summer, when the leaves were in all their delicious freshness, Laurentius, after the toils of the day, quitted the city of Hærlem, and wandered forth into the neighboring fields. As he sauntered along, the sounds of the distant populace grew fainter on his ears, and the beauty of Nature beneath the setting sun awakened a train of thoughts connected with the passing glories of the scene before him, and the instability and changes that seem combined with the very nature of all that is fair and beautiful.

There came over him saddening reflections, recalling the languor of his own little Lotchen, and he thought how gradually her smile, like the light of a twilight sky, grew fainter and fainter. Much he feared all would be dark soon—dark to him; that his child herself would be a shadow; her voice but a fairy song, an echo fleeting farther off in his memory, till it mingled, and was lost forever, in the murmurs of the infinite Past.

He had striven to minister to her comforts and amusements, yet toys, and even flowers, were neglected now, or yielded but a momentary pleasure; and so the gloom deepened upon him—upon all; for this was not his only grief; ever as the child drooped more and more, there came anguish over the countenance of another, whom he loved dearer than life itself.

Laurentius had begun to instruct his Lotchen in the rudiments of reading. She had learned with avidity, at least in days of health and vigor; and even that morning, reminding him of some manuscript which he had shown her, with its illuminations and large initial letters; she had besought him to design for her some of its words, that she might keep them by her, and look at them, and learn them—when she was well again.

In his walk, he heard a bird singing in a wood close by; it was a merry strain, but it made him sadder, if possible, for it reminded him of a time not long ago, on that very spot, when, with a fair companion on his arm, he momentarily led her aside, and pointed out to her in living letters her own gentle name, carved on the bark of a young tree.

Now, thinking also to gratify his child, stepping out of the path he engraved some letters on the rind of a beech-tree.

He would have carved her name, too—"Lotchen"—but his hand slipped at the second letter, so he made it another word. Then, cutting a square of bark from the tree he folded it in a piece of paper, and returned home.

Pleased was the little girl when she heard her father's step, and she stretched out her hand to take his present. But, even as he told her of the carved letters, her eyes became dim, and she said she was "a weary," and then, as she saw her mother turn away, and her father looked strangely at her, she put out her hand feebly for the letters, and, placing them beneath her pillow, said she "would look at them by-and-by;" and no doubt she did so, for she had become, during her illness, an angel in truth and gentleness; but it must have been in Heaven that she read them, for she died that night!

Laurentius bowed down with grief; but, after a time, he arose and went to his usual occupation; and, one day, casting his eyes upon the cover, in which he had wrapped the beech rind, he perceived that the cut edges of the letters had stained the outlines of a word upon the paper. That word was "Light"—the talisman that led to a mighty discovery—the "open sesame" of an infinite store room of thought and of intelligence.

Thus runs the tale—for it is an old one, and in telling it we have indulged in a few particulars—*thus* was Printing invented.

But not to Hærlem only, but to Montz and to Strasburg has been assigned the honor of this discovery. Very earnest at one time was the controversy, and each locality had certain pretensions to enforce.

Laurentius sometimes called "Coster," from his office in the Cathedral at Hærlem, has the prior claim. From the rude hints he had now obtained, he perfected a sort of press or rather wooden stamp, on which he cut his letters. He impressed one side of his sheets only, pasting the unlettered surfaces together, to render their appearance more sightly. The earliest of his essays was long considered to be a work entitled *Speculum Nostræ Salutis*; subsequently, however, a book was discovered, supposed to be the first specimen of printing. It was an Horarium, impressed on parchment, of eight pages only, containing the Alphabet, the Lord's Prayer, the Apostles' Creed, and three other prayers. It was the rudest thing in the world—such as the first specimen in a new discovery might indicate—as primitive almost as the first steam engine. It had no numbers to the leaves—no distinctive marks or points: the lines were uneven, and of various lengths; nay, the very shape of the pages differed, some being rhomboidal, some square, some angular. This might be about A. D. 1430.

Previous to this era, wood engravings, a sister art, had been invented. In connection with it, a curious circumstance has come to light.

The earliest supposed specimen, bearing date A. D. 1423, was a representation of St. Christopher carrying the infant Jesus.—However, about seven years since, an ancient print was discovered at Malines, on the lid of an old chest, of a religious subject, dated A. D. 1418. It was purchased for twenty pounds, by the conservator of the Royal Library in Brussels, and is a far more curious and better finished specimen than that of St. Christopher, which is, we believe, in the possession of Earl Spencer.

Playing cards are said to be of an earlier date—first painted, they were supposed to be printed towards the end of the fourteenth century. Hence sprang the engraving of the immages of saints on wood.

Hærlem was not long permitted to boast the undisputed possession of so valuable an art as printing. The invention, in spite of all attempts to conceal its nature, was pirated. It is generally supposed that a workman of Laurentius fled to Strasburg. At all events, Geinsfleich, alleged to be the elder brother of Guttenburg, set up a printing machine in connection with the latter, in that town. This undertaking, however, appears to have been fruitless—nay, utterly failed—for there is no proof of any book being printed at Strasburg till after A. D. 1462, the date of the general dispersion of the printers.

Guttenburg shortly afterwards made his appearance at Mentz. This city was undoubtedly the scene of that improvement in the art which amounted to second invention, and endued it with a vitality which may be said to have rendered it immortal. It was the application of movable metal types, instead of the old, fixed wooden ones—an improvement still further enhanced by the use of cast, instead of cut letters; and here for the first time appears on the scene John Fust, or Faust.

Faust, or Faustus, is a name memorable alike in truth or fable. Marlow and Goethe, in undying verse, have immortalized their hero; but the Faust of history is no less famous, and stands forth, in connection with the superstition and fears of an age that saw in his perfection of a wonderful art, something ominous of an alliance with the Enemy of Mankind.

With John Guttenburg, did Faust, an eminent and enterprizing citizen of Mentz, associate himself as a partner in the first printing press; while his own energies and pecuniary resources, combined with the skill and practical knowledge of his coadjutor, soon gave that significancy to the discovery that immediately rendered it famous throughout the world. Wonderful as was the power of Thought, it might be said to have now acquired an omnipresent and all pervading vitality. Hitherto, the discoveries of science, and the experience of the profoundest minds, were but indented upon sand, which every deluge of barbarism was certain to efface; *now*, a security was given to man—a sort of ark—which should securely float down the tide of Time to the remotest ages; not only preserving within it all that was most precocious in intellectual acquisition, but containing a talisman which should stay, or at least divide, the stormiest waters, so that the good and the true should henceforth pass dry-shod and unharmed among them!

John Faust, citizen of Mentz, having amassed considerable wealth by commercial pursuits, became stimulated by a nobler ambition than that of mere acquisition, and was desirous of devoting his fortune and his energies to some system which, though it might benefit him in a pecuniary view, should also conduce to the intellectual and physical advantages of his fellow men. Long, however, did he muse in his search for an efficient mode of carrying his project into effect.

One evening, as the shades of twilight were descending, and he sat alone, deeply absorbed in thought, upon looking up, he beheld a tall dark, form before him. There was an ominous light in the eyes, and a wild intelligence on the dusky brow of the stranger, but on his sunken cheeks were care, and unrequited toil, and famine.

With scarcely a word of apology for his intrusion; with some muttered exclamation that he had "at length found the man he had long been in quest of," Guttenburg—for he it was—unfolded a small packet, and spread upon the table some pieces of metal. Faust looked, rather than asked, for an explanation. The stranger placed the dies in a kind of stamp, painted the surface of the letters—for such they were—with a dark fluid, produced a piece of vellum, and impressed upon it a short sentence. He repeated the operation several times, on each occasion comparing the reults. He then displayed a printed page—nay, several printed pages—identical in form, words, and points; such as no scribe could imitate or repeat—such as only could be performed by some new and wonderful art, or by magic.

When Faust had sufficiently admired the production, he exclaimed that "such a beautiful invention must bring its own reward, and that its authors must speedily become independent of the wealthy and of the great."

The stranger made no reply. He took from his vest a small lamp, of a construction that seemed to combine the excellencies of all the latest improvements; he touched the wick with a match, it lighted up, streaming through the apartment, now darkened by the shades of evening, then instantly went out.

"It wants oil—it has none," said Faust.

"Behold the lamp!" replied Guttenburg, again spreading the metal type before Faust. "It wants oil—will you supply it?"

"I will."

That night the bargain was struck—the compact signed—the lamp was lighted!

That lamp had the power of infinite multiplication. From a little star, it became to the world a sun; it pierces through the thickest clouds of moral and mental darkness; it was soon reflected by other lamps, of more or less intensity, throughout the civilized world.

For some years Faust and Guttenburg labored together. Though not the inventors they stamped this art with a utility that rendered it universal. It was, in many senses, a fearful innovation; it swept away whole centuries of conventional rights and monopolies. Soon, however, it directed itself to mightier and loftier objects.

These were the magicians, and at one time it appeared they would have experienced the fate of all supposed confederates with the power of darkness.

Our Faust did not shut himself up with Wagner, to discourse of "dry philosophy," nor roam the world at large with Mephistophilis, to indulge in luxury, or share the witches' banquet; but he had leagued himself with the unknown, mysterious Guttenburg, and that was nearly as bad. He wielded a power which shook the conventional world to its foundation.

When the first productions of the two printers came out, we are told they created a vast sensation. Men could not sufficiently admire and wonder at the new art; the most accurate scribes, and the best judges of chirography, were astonished at the exact similitude of each copy of an impression; they had no idea of the means—at least the greater portion of them—by which this identity of character was produced, for the operations of the printing press were guarded and watched over with jealous and mysterious solicitude.

If Faust eschewed magic, we cannot deny but that he loved mystery. Thus, in a most splendid edition of *Tully's Offices* which issued from his establishment, he declared, in an appendix that "The book was not executed by means of ink, nor a quill, nor a brazen pen, but by a wonderfully beautiful art!"

Books, and editions of books, were now published from the press at Mentz, comprising hundreds of volumes, identical in every respect—nay, even to the slightest error, or smallest typographical mark.—Gradually, the admiration of the public yielded to a sort of superstitious wonder; then, to fear—to hate. Many, too, were personally interested in denouncing the new art. Fanaticism and ignorance set earnestly to work; the passions of an uneducated populace were speedily aroused; neither witches nor wizards had ceased to be believed in, nor persecuted; and there was in the legends of the people, many a wild tale of supernatural agency.

It had been the custom of the scribes to illuminate and embellish some of the ancient manuscripts. Faust, to enhance the value of his impressions, had in some degree followed their example; he had introduced colored inks; in many of his books the red hue predominated.

This was conclusive; little further proof was required by his enemies; for here were displayed the very signs by which he had contracted his compact with the Evil One. The populace of Mentz rose in tumult. In vain he addressed the municipality; his house was invaded, his presses were destroyed, his business suspended—nay, it is even said he was obliged, for a time, to shelter himself in concealment from the fury of the rioters.

But Truth prevailed again; the violence of the populace subsided as quickly as it had risen, and the printing press resumed with increased vigor its operations. But Faust and Guttenburg had quarrelled; they were no longer to be associates. The man of genius and the man of enterprise separated; each betook himself to his own path: the mighty secret was divulged, and the press, the deadliest enemy of monopoly, whether scientific or political, became patent to all mankind.

Faust, in union, with other partners, issued many works from his establishment.—There is a love story, too, connected with this art, with his daughter, the gentle Christiana; but we will not tell it *now*, lest we be accused of romancing.

Faust lived to witness many of the mighty effects of the science which he had so materially promoted. He was undoubtedly a man of energy—a master-spirit in his time—one of, if not the last of the magicians; for the night clouds were breaking up, and the mighty revelations of new truths, as they rose, shone with the clear light of stars, and startled not with the same fears and superstitions as they did of old!

## SENSIBLE REMARKS.

The Rev. Henry Ward Beecher in his remarks at the anniversary of the Five Points Mission, said:—"When Christ went where there were sick He healed them; where there was actual want He created bread, and came down to their physical condition.—Take the gospel to the miserable outcasts of our city, and no man can preach it, unless he does more. It is as though he made a mark in the sand, and the first tide washes it away. Preach the Gospel, and the hunger of the man makes him forget it. There is a great deal more Gospel in a loaf of bread sometimes, than in an old dry sermon. If I go to a man and bring to him in his want over so much philosophy, he will not hear it; if I come down to him and bring him bread, and clothes, and medicine, this will give him a correct idea of the Gospel—one which he can appreciate and understand."

**MERCHANTS SUPPLY STORE.**

THE Subscriber has made extensive arrangements which enables him to supply merchants with any of the tools named in the annexed list, at the lowest current rates, either in large or small quantities. The goods are ordered direct from the manufacturers, and are in every respect the best of their kinds made in the United States.

500 dozen Dunn's Grass Scythes, German, Cast and Silver Steel.
400 do. Dunn's Grain Scythes, the best in market.
100 do. Clapp's Patent Scythe Snaths.
50 do. Lamson's do. do.
50 do. Clark's Ohio Patent Snaths, Scythes to fit.
50 do. Wood's Scythe Snaths, cheap.
50 do. Braud's Manure Forks.
75 do. Do. Straw Forks.
100 do. Do. Hay Forks.

A good supply of Reynolds' Hay and Straw Forks.
100 doz. Whitlock's Solid Cast steel Hoes.
200 " Stillman's Cast steel Hoes.

Scythe Stones, Rifles, and other tools in the same line, all of which will be sold on the lowest terms. Sale rooms at the Agricultural Warehouse of E. D. Hallock, 24 Exchange street, Rochester, N. Y. ☞ All orders by mail promptly attended to. HIRAM C. WHITE.

**Imported Horse, "Consternation,"**

WILL stand this season at the farm of the subscriber, two miles west of Syracuse and adjoining the village of Geddes. His colts and fillies are already in demand for breeding. Several have been sold during the past winter, at handsome prices, to go out of the State.

Terms.—$10 for the season, and $15 to insure; the money to be paid in advance in all cases. When a mare is insured and left at the farm of the subscriber, or regularly returned to the horse until the groom is satisfied she is in foal, a receipt will be given promising to refund the money if the mare was not got in foal. Pasturage furnished at three shillings per week. Mares to be at the risk of owners in all respects. J. B. BURNETT,
May 14. [177-tf] Syracuse, N. Y.

**GARDEN AND FIELD SEEDS**

*From the New Establishment of Van Zandt & Bowdish,*
No. 111 State street, Rochester, N. Y.

CAN be purchased of the merchants generally throughout the country, in Papers or Packages, on the most reasonable terms. Also at the Agricultural Warehouse of E. D. Hallock, No. 24 Exchange street, near the Clinton Hotel, Rochester, N. Y.

The Seeds from this establishment can be relied on as being of the very best quality. They are mostly imported, or grown by the Eastern Shakers, and are warranted.—Full directions for cultivation printed on each Paper and Package. VAN ZANDT & BOWDISH.
Rochester, N. Y., 1853. 170m6.

**FERTILIZERS.**

PERUVIAN GUANO.....$45 per ton.
Super Phosphate of Lime,.....2¼ cents per pound.
Bone Sawings, or Meal,.....$2,50 per barrel.
Turnings and Crushed,..... 2,25 " "
Pulverized Charcoal,..... 1,00 " "
Plaster, Ground,..... 1,12½ to 1,25 do.
Potash Scrapings,.....3½ to 4 cts. per lb.
Sulphuric Acid,.....2¼ to 2½c. "

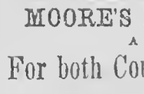
For sale at the State Agricultural Warehouse.
LONGETT & GRIFFING,
178w8. No. 25 Cliff Street, New York.

**GENESEE PAPER MILLS.**

CO-PARTNERSHIP NOTICE.—The subscribers having purchased the Genesee Paper Mills property, have this day formed a Co-partnership, under the name and firm of Adams, Huntington & Co., for the purpose of Manufacturing Printing Paper, and dealing at wholesale and retail in all kinds of Paper Stock. Office and Warehouse, No. 93 State street.

FRANCIS T. ADAMS, E. T. HUNTINGTON,
WILLIAM A. ADAMS, ALVAH STRONG,
ALBERT M. HASTINGS, D. D. T. MOORE.
Rochester, April 15, 1853.

**MARSHALL'S BOOK BINDERY,**



BURNS' BLOCK corner of State and Buffalo street, over Sage & Brother's Bookstore, Rochester, N. Y.

Music Books, Pamphlets, Periodicals, &c., bound in plain and fancy bindings; old books rebound; Blank Books ruled to any pattern, and bound to order; Public and Private Libraries repaired at short notice. Packages containing directions for binding, punctually attended to.

N. B.—All work warranted, and done at low prices.
April, 1852. [122tf] F. H. MARSHALL.

**GREAT PRIZE MEDAL.**

THE WORLD'S FAIR AT LONDON, awarded us a Mammoth Silver Medal for the Best Hats.—Gents wishing the Spring and Summer style, will call. We are prepared to serve you with a superior article, and of the most becoming style.
CLARK & GILMAN, 23 State St.,
[169-3m.] Rochester N. Y.

**Important to Farmers**
**PORTABLE MILL.**

[From the Ohio Farmer, December 2, 1852.]

ROSS' Improved Patent Conical Burr Mill Stones.—Our readers will many of them remember that Ross' Portable Burr Stone Mill took the First Premium at the Annual State Fair, held in this city a few weeks since.—This admirable invention must commend itself to every one who has witnessed its operation. In the first place it is easily portable, simple in structure, does not easily get out of order, and does its work with great rapidity and perfection. It may be used for grinding the coarsest food for cattle, or the finest meal for family use. It is also well adapted for grinding wheat, rye or buckwheat. It is indeed a perfect grist mill in miniature, and we would advise every farmer, if possible, to procure one. The expense of one of these mills, with the apparatus for horse power, can not be very great; or a number of farmers might club together and procure one, which would be sufficient for all.

Mr. Ross is, we believe, a resident of Rochester, N. Y.

N. B.—Any further information relative to the Conical Mill can be obtained by letter, post-paid, or by calling at the factory of CHARLES ROSS,
2d story Phenix Building, Aqueduct-st.,
154-tf opposite the Arcade, Rochester, N. Y.

**MOORE'S RURAL NEW-YORKER:**
A WEEKLY HOME JOURNAL,
**For both Country and Town Residents.**

PUBLICATION OFFICE,
Burns' Block, corner State and Buffalo Sts.,
Rochester, N. Y.

**TERMS, IN ADVANCE:**

Two Dollars a Year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

**Terms of Advertising**

One Dollar per square (ten lines—100 words, or less,) for each insertion,—*in advance.* ☞ The circulation of the New-Yorker is much larger than that of any other newspaper published in the State, out of New York city. Only a limited space, however, is devoted to advertisements, and hence preference is given to those most appropriate—such as the cards and notices of dealers in Agricultural Implements and Machinery,—Horticulturists and Seedsmen,—Booksellers and Publishers,—Inventors, etc. All orders by mail should be accompanied with the cash.

To enable us to accommodate as many as possible, brief advertisements are preferred. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

**THE WOOL GROWER AND STOCK REGISTER.**

This is the only American Journal primarily devoted to the interest of Wool and Stock Growers, and should be in the hands of *every owner of Domestic Animals.* It is ably conducted, published in the best style, and finely illustrated. Each number contains a careful Review of the Wool and Cattle Markets, and much other *useful* and *reliable* information which can be obtained from no other source. The Fifth Volume commences with July, 1853.

Terms:—Fifty Cents a Year; Five Copies for $2; Eight for $3; Eleven for $4. Back volumes, bound in paper, at 40 cts. each,—unbound at 35 cts., or three for $1.

Published monthly, in octavo form. Specimen numbers sent free. Money, properly enclosed, at our risk.

Address D. D. T. MOORE, Rochester, N. Y.

MOORE'S
# RURAL NEW-YORKER.

VOLUME IV. NO. 28. ROCHESTER, N. Y.—SATURDAY, JULY 9, 1853. WHOLE NO. 184.

**MOORE'S RURAL NEW-YORKER:**
A QUARTO WEEKLY
**Agricultural, Literary and Family Newspaper**

CONDUCTED BY D. D. T. MOORE,
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter—interspersed with many appropriate and handsome engravings—than any other paper published in this Country.

☞ FOR TERMS, &c., see last page.

# Rural New-Yorker.

## Progress and Improvement.

### WHEAT.—TIME OF HARVESTING.

IN each volume of the RURAL we have called the attention of farmers to the subject of the best time for harvesting the wheat crop, taking into consideration the maturity of the same and the uses to which it is applied, and giving the results of a variety of experiments showing the influence of early cutting on the quantity and quality of the grain. Yet, as it is again seasonable, and we have many thousand new readers who, perhaps, need a reminder, we again gather a few hints to invite their thoughts to the Time of Harvesting.

Many experiments in cutting wheat, at different times, from quite green until dead ripe, go to show that from twelve to fourteen days before the latter period, gives the plumpest, heaviest, thinnest-skinned and most nutritive grain. The loss in weight by standing is nearly 15 per cent, and the loss by increase of bran, in equal weights, nearly 4 per cent. At this period the grain is in the milk, "there is but little woody fibre; nearly everything is starch, gluten, sugar, &c., with a large per centage of water. If cut then, the proportion of woody fibre is still small; but as the grain ripens, the thickness of the skin rapidly increases, woody fibre being formed at the expense of the starch and sugar; these must obviously diminish in a corresponding degree, the quality of the grain being of course injured."—So wrote that able agricultural chemist, the late Prof. NORTON.

The value of the straw as food for animals is also much enhanced by early cutting. The experiments show about the same per cent increase in the one as in the other.—The philosophy of this was shown in our remarks of last week, on cutting and curing hay, in which the period of its greatest nutritive power was shown to be some time before the ripening of the seed. The value of wheat straw depends upon the observance of the same law, and thus it is seen that the time of harvesting which best secures the value of the grain and straw very nearly coincides.

A saving of grain is also made from the fact that the waste from shelling is avoided. This loss is often large in fully ripe wheat, and it is a loss which no one can wholly avoid at that time.

The loss from *rust* will, in most cases, be prevented by early harvesting. This disease generally makes its appearance at about that stage of growth recommended for cutting the grain, and whenever it does appear its injuries can at once be checked by immediate harvesting.

More time, also, is allowed for the work, if it is commenced at an early period. The business of securing the crop is not crowded into a few days, in which it must be accomplished or serious injury result from over ripening, and, if the weather is bad, from growing in the ear.

The proper stage of maturity for cutting may be judged of more accurately, perhaps, if described as that when the stalk immediately below the head for two or three inches, has become yellow and dry, consequently cutting off the circulation, and the grain, though soft and doughy, ceases to yield any milk upon pressure. This occurs about a fortnight before the seed becomes dead ripe, as has been already observed.

In early harvesting, of course, greater attention must be given to the curing and drying of the grain. It is advisable to allow it to dry a half day or so in the swath before binding, and then small bundles only should be allowed. It should be shocked up before the dew falls, and will need to stand there for a longer period than if cut later. Should no rain occur, the common practice of setting up the sheaves in a double row with the heads resting against each other, is the most simple and will prove a good one. Against heavy showers, however, this gives but little protection, nor is covering shocks formed in the same manner, with sheaves laid on horizontally, the heads touching each other, a much better plan. The best mode, considering the "uncertainty of the weather," is to set up a half dozen sheaves in a round, compact form, covering them with two others, broken in the middle and laid on in the form of a cross, with the ends spread out, which affords a perfect and reliable cap for the shelter of the grain beneath from the usual storms of the season.

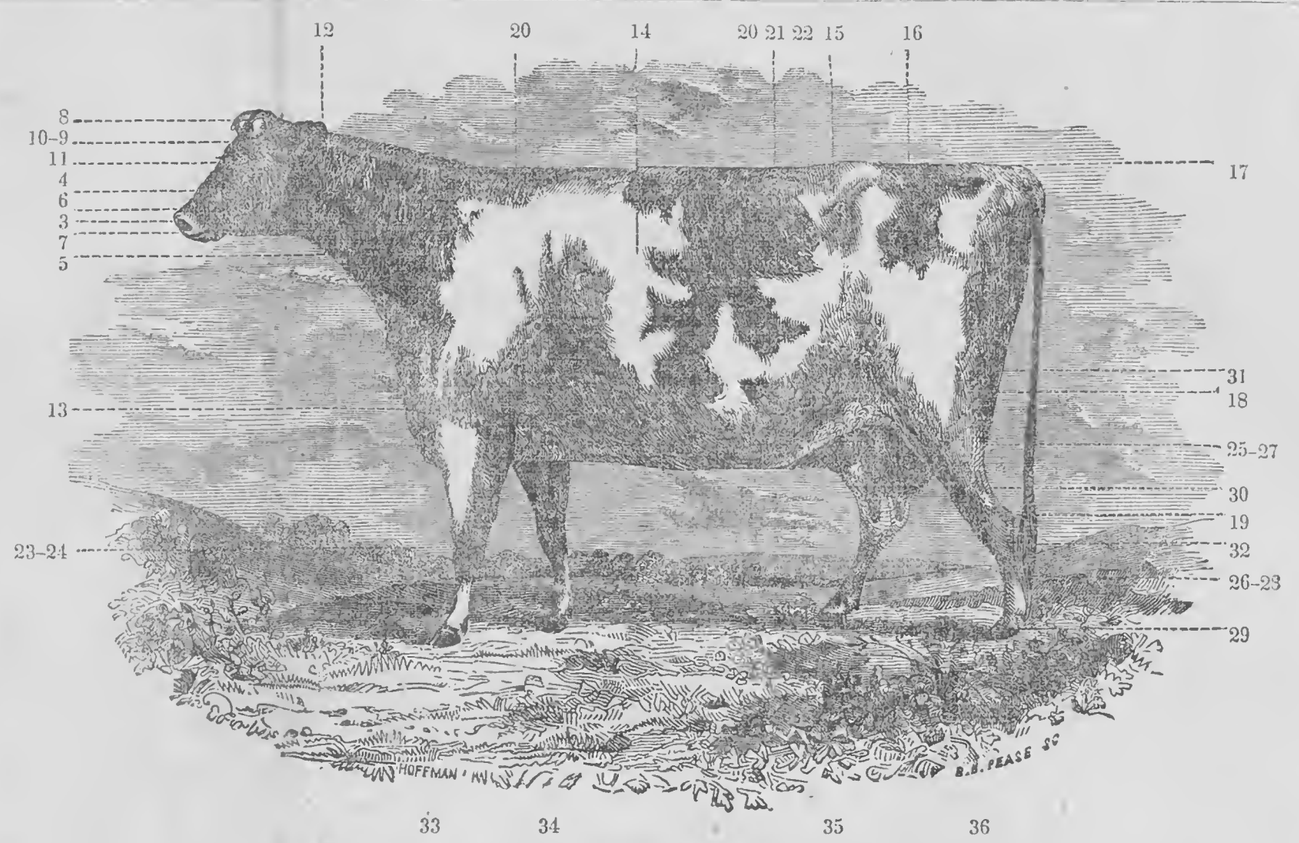
Of the manner of cutting we have little room or need to speak. The best implements, good and thorough workmen, and enough of them, and order and system in every operation, will soon do up the work and secure in good condition this most important product of our soil. May fair weather be granted for the Harvest Time!

### CORN.—HOEING AND TOP-DRESSING.

IN looking over the mode of cultivation practiced by those most successful in growing the corn crop, and especially the statements of those who have taken premiums for large products of this cereal, we almost invariably find that clean culture and top-dressing were practiced. The corn was hoed at an early stage in its growth, after first going through it several times with the cultivator so as to mellow the soil as far as possible; and then to each hill some stimulant was given, such as plaster, ashes (leached or unleached) or a mixture of the two. In a few weeks the cultivator and hoe was used again, and the stalks thinned to four in a hill; nor did this suffice, for if time allowed, before the corn became too large to admit of the passage of the horse, the cultivator was again employed and another dressing with the hoe given. At this stage in its growth the ground becomes so shaded by the luxuriant leaves of the grain that little farther attention is needed.

Experience confirms what reason teaches, that large crops of corn can only be grown on rich and well cultivated soils. The structure and size, and the rapid growth of the plant, show that it requires to be well supplied with the necessary food for its growth and perfection. It possesses the power of elaborating healthy aliment from coarser food than almost any other cultivated plant, hence its great value as a preparatory crop when such manures are to be used. It draws largely upon the air, and hence needs that its large leaves be kept healthy and fresh, not parched and rolled by drouth or discolored by the presence of stagnant water in the soil. Plow deep, manure freely, plant early, hoe and top-dress with ashes or plaster, keep the soil mellow and flat and allow no weeds to grow, and your corn crop will repay well all your care and attention. Neglect it, and "nubbins" will be your reward.

KINDNESS TO ANIMALS.—We have seen horses, says the Alb. Cultivator, which were used for driving a ferry boat, pass unled from the stable to the boat, step on board, walk to the machinery and 'back' themselves downwards through a narrow door, on the wheel, ready for work, entirely unattended, while most other horses could scarcely be driven on board. An invariable feeding of oats, immediately following the act, sufficiently accounted for this remarkable movement. The animal quickly understood the connection between his position on the wheel and his breakfast.



JERSEY COW,—PERFECTION 36 POINTS, ILLUSTRATED.

As much attention and discussion is being given to Points of Excellence in Cattle, anything pertaining to the subject will prove interesting to stock breeders. Hence, above we give our readers a portrait showing the "points" adopted by the Royal Jersey Agricultural Society for guiding judges in determining the merits of Jersey (miscalled Alderney) Cows. "With a few exceptions, the same points are good in judging of any cow. Three of the points here given—No's. 30, 31, 32,—are deducted from the number required for perfection in heifers, as their milking apparatus is not perfectly developed. A heifer is considered perfect who has thirty-three points. No prize is awarded to either cows or heifers having less than twenty-nine points." The points adopted by the Society are thus specified:

*Scale of Points for Cows and Heifers.*

| Article. | Points. |
|---|---|
| 1. Pedigree on male side | 1 |
| 2. Pedigree on female side | 1 |
| 3. Head, small, fine and tapering | 1 |
| 4. Cheek, small | 1 |
| 5. Throat, clean | 1 |
| 6. Muzzle, fine and encircled with a light color | 1 |
| 7. Nostrils, high and open | 1 |
| 8. Horns, smooth, crumpled, not too thick at the base, and tapering, tipped with black | 1 |
| 9. Ears small and thin | 1 |
| 10. Ears, of a deep orange color within | 1 |
| 11. Eye, full and placid | 1 |
| 12 Neck, straight, fine, lightly placed on the shoulders | 1 |
| 13. Chest broad and deep | 1 |
| 14. Barrel hooped, broad and deep | 1 |
| 15. Well ribbed home, having but little space between the last rib and the hip | 1 |
| 16. Back, straight from the withers to the top of the hip | 1 |
| 17. Back, straight, from the top of the hips to the setting on of the tail; and the tail at right angles with the back | 1 |
| 18. Tail, fine | 1 |
| 19. Tail hanging down to the hocks | 1 |
| 20. Hide, thin and movable, but not too loose | 1 |
| 21. Hide covered with fine and soft hair | 1 |
| 22. Hide of a good color | 1 |
| 23. Fore-legs, short, straight and fine | 1 |
| 24. Fore-arm, swelling and full above the knee and fine below it | 1 |
| 25. Hind-quarters, from the hock to the point of the rump, long and well filled up | 1 |
| 26. Hind-legs, short and straight (below the hocks) and bones rather fine | 1 |
| 27. Hind-legs, squarely placed, not too close together, when viewed from behind | 1 |
| 28. Hind-legs, not to cross in walking | 1 |
| 29. Hoofs, small | 1 |
| 30. Udder, full in form, *i. e.* well in line with the belly | 1 |
| 31. Udder, well up behind | 1 |
| 32. Teats, large and squarely placed being wide apart | 1 |
| 33. Milk veins, very prominent | 1 |
| 34. Growth | 1 |
| 35. General appearance | 1 |
| 36. Condition | 1 |
| Perfection | 36 |

### STATE FAIR ARRANGEMENTS.

EDS. RURAL:—In a notice of the State Fair arrangements which I saw in one of the late No's. of the NEW-YORKER, I find that pay will be required for stock and articles intended for the Fair, when received on board the cars, and on their return with certificates of exhibition, the amount paid is to be refunded.

As I understand this notice, on all articles and stock taken to the Fair, which is not returned by the same route, the amount prepaid will be retained, but for those which the exhibitor returns pay will be refunded. This arrangement I think will be prejudicial to the interests of the Society, and especially injurious to the growers of stock.

The principal benefit of our State Agricultural Society has been the general introduction of improvements on articles and stock into every part of the State. It is not simply for the encouragement of the exhibition, but it is to draw the various improvements in proximity, where the buyer can compare the different kinds and have an opportunity of selecting that which he deems the best. Were it not for the buying and selling, which take place at the Fairs, the patronage would be much less and the benefit comparatively small.

Buyers come, not only from the extreme parts of this State, but from almost every State in the Union, for the purpose of selecting and taking home with them the choicest stock.

Now, while it would be reasonable and just to require the owner on his return, to present a certificate from the Secretary of the Society of the entrance at the Fair of all his animals, it seems to me to be unjust and unwise to charge him for transportation simply because he does not return them over the same route. Is the transportation of stock desirable, that the Railroad companies adopt this means to induce the return of all that go to the Fair? Would it be attended with more trouble or expense for them to return half, than it would be to return the whole number which are taken? Clearly not. It will destroy that equality of expenses which has hitherto been an important feature of our Fairs. An exhibitor living near the place of exhibition will be enabled to sell at a lower price than one from an extreme part of the State, who must pay $5 or $10, for the transportation of every animal which he sells.

Were our State Fairs a source of loss to the railroad company, we should not expect that they would favor them. But, on the contrary, each State Fair yields to them, pecuniarily, a rich harvest. That they have favored the stock growers and mechanics for years, with free transportation is true, but for this we can give them no credit for generosity: the favor was always grudgingly bestowed and often attended with almost intolerable insolence. They have done it because their *interest* required them to keep alive the institution. It was a matter of policy for which they received pay an hundred fold, by the immense number of tickets purchased by visitors to the Fair.

Stock for the Fair is usually crowded into cars so densely as to make it impossible to feed them, and, after being "laid over" at the various stations as they generally are, they arrive at the place of their destination in a starving condition. They are frequently delayed from ten to fourteen hours, without any satisfactory reason being assigned—while the famished herd after one or two days fasting, have only to await in their filth, the good pleasure of some crabbed official, grown stiff and haughty from small honors.

It seems to be an acknowledged right of incorporated companies to resort to practices, for their pecuniary benefit, which would be regarded as mean and dishonorable in an individual. Thus are the State Fair cattle trains every year beset with collectors, who not unfrequently demand full fare of those who are compelled to ride in charge of stock, ankle deep in filth, while those who are expeditiously and comfortably carried to the Fair are only asked half. Last fall, the cattle train left Auburn the day before half fare tickets were issued, and the collectors insisted upon full fare. For the companies to send their agents to closely scrutinize the trains and collect a paltry sum of those who are obliged sometimes to ride day and night in a loathsome and filthy car, and those, too, who are doing much to sustain an institution which yearly brings thousands of dollars into their treasury, seems to me an act which an honorable man in his individual capacity would scorn; the practice of *honorable companies* to the contrary notwithstanding. They have an undoubted right to do it, but that person who rules his conduct by his right, without regard to justice or politeness, will oftentimes appear mean and contemptible.

JUSTITIA.

Sennett, Cayuga Co., N. Y., May, 1853.

### A THOUGHT FOR YOUNG FARMERS.

MESSRS. EDITORS:—No class of the citizens of this country possess better opportunities for thought, study and reflection than farmers, and why is it that so few obtain notoriety, as original thinkers, writers, or speakers? It cannot be that they lack natural intellectual capacity, nor are they deficient in the ordinary branches of literature; there are but few who are not able to speak, read and write, and would they practice with a view to improvement, they would soon do it correctly and even elegantly. A cause for this there is, and also a remedy which has never yet been applied, otherwise the cause would not still exist.

As I have had some experience in farm labor and life, permit me to give a brief abstract of my views on the subject.

I have hoed many a row, when my tho'ts were every where else but on my labor, yet my work was as near perfect as though I never thought of any thing else. I went on mechanically, alike unconcious of the moving power or guiding cause, until something unusual transpired to break the chain of fancy, when I would wake up to find my-

self far advanced beyond the point of last remembrance, retaining only a vague, indistinct, shadowy recollection of some ghost of an idea or thought, as difficult to follow up and trace home to a conclusion as to follow the ship by the marks of her keel in water, or the winged arrow through the air. So it is with the farmer at his labors; his best and choicest thoughts are allowed to come and go, without benefit to himself or others, because, unknown, unexpressed, and lost. He should adopt Dr. FRANKLIN'S prudent theory.—"What won't make a pot, may make a pot-lid,"—and save every thing, even to thought, for future use. To do this he should have a note-book and pencil in his pocket, when at his labor, ready to record every new idea that occurs to his mind. These notes at noon, night, or other period of relaxation and rest, when the mental powers are the keenest, he could rearrange and dress up in his best style and choicest words, with such improvements as would naturally suggest themselves. This would so impress them upon his mind that they could never be forgotten.

What a volume one short year would produce, and what a field he would have sown with the seeds of thought, which with proper attention and cultivation would produce a thousand fold! What a fund of knowledge and wisdom he would accumulate—all his own, consequently the more valuable.—It might and probably would be a somewhat tedious and discouraging task at first, but with a little patient, persevering practice, and a habit once confirmed, it would become a delightful one, and he could no more retire to rest with it neglected, than a prudent man could with a knowledge that the front gate was open, leading into his choicest field or garden, his treasure chest unfastened, or to take a look at the weather-prospects in harvest time. A portfolio filled with such thoughts and reminiscences as almost any or many of our common farmers are capable of collecting, would be worth its weight in gold as an heir-loom to posterity; commanding filial respect and admiration,—as a medicinal case, containing a remedy for his mental ills, and the subject should receive, at least, equal attention with that of the accumulation of dollars and cents.

Were such a course pursued by farmers, they would soon occupy a far different position in society, and be not only the bone and sinew, but the spinal column, and with the improvements such a practice would effect, the head also, becoming much better qualified to fill the legislative hall than any other present class. Possibly they might not be as fluent in quoting Coke and Blackstone as lawyers, but full as well versed in common-sense-equity and justice.

Marcellus, June, 1853. S. GRAVES.

## CONDENSED CORRESPONDENCE.

### Queries in Cultivation.

EDS. RURAL:—I am aware of my incompetency to do justice, not only to the public, but to my thoughts and the subject, but in view of its importance and with the hope of calling the attention of others more competent to its discussion, I would offer the following hints on a new theory of cultivation. I am confident that it furnishes the true reason and cause why corn does better without hilling than with, and believe the principle applicable to all plants or vegetables.

To promote inquiry and the diffusion of useful knowledge, I propose the following questions to your readers:

1. Why are new roots sent out from the main tap root, or fibres from other roots, whenever earth is placed around the plant and over the roots?

2. Does it not retard the advancement of the plant to compel it to send out new sets of roots?

3. Is it not proof positive that the plant cannot otherwise attain certain solar influences absolutely necessary to its perfection?

I shall offer my theory on this subject in a future number.—S. G., *Marcellus, N. Y.*

### Change of the variety of Wheat.

EDS. RURAL:—Friend "'HIEL'S" experience in the change of the variety of wheat, to me is truly remarkable. It is contrary to all of my experience in wheat culture.—For several years past, I have sown different varieties side by side in the same field, and it has always proved to be of the same variety,—no change. Now, if the change in "'HIEL'S" wheat was caused by the blossoms or pollen of a different variety, from some other field, why would it not have the same effect on ours? We think it must have been that the *same agent* changed the variety of his wheat, which changed that of his potatoes. I never have known my wheat to change to chess. When I sow clean wheat, it always "*yields seed of his kind*, whose *seed* is in *itself*." When I sow chess, of course it does not *change* to *wheat*.—L. N., *Windsor, Ashtabula Co., O.*, May, 1853.

DR. VAN SLYCK'S BRAHMA POOTRA FOWLS.

### Dr. Van Slyck's Brahma Pootras.

THE above engraving represents a group of Brahma Pootra folws, owned by Dr. DEWITT C. VAN SLYCK, of Alloway, Wayne Co., N. Y., by whom we are furnished with the following remarks:

These fowls are a choice selection from the stock of Dr. J. C. BENNETT, of Great Falls, N. H., by whom they were imported frem the valley of the Brahma Pootra river in India. One pair of the above, when 8 months old, weighed 19 lbs., and will, with reasonable certainty, reach 24 lbs. at maturity. The cock is 29 inches in height—pullets in proportion. As layers they are remarkable, one of the pullets having laid 81 eggs previous to 1st June last, then 10 months old. They are a pure and distinct breed, being neither *Chittagongs, grey Shanghais*, nor a *cross* of either. They are generally light colored, some nearly white with penciled neck hackles of a darker shade; others in addition are beautifully varigated with light brown and yellow. The down is frequently a perfect blending of light and dark colors—wing tips and tail black—legs golden yellow and generally feathered—wings small—comb usually large, single, and serrated—wattles large and pendulous—weight 8 to 10 lbs. for pullets, cocks 10 to 14 lbs.—shape and carriage beautiful in the extreme. They are prized especially for their remarkable size, quiet disposition, excellent laying qualities, delicacy of flesh and eggs, great aptitude to fatten; and for their hardiness.

### Mr. Morse's Stock and Dairy Farm.

THE peculiar features in the management of MORSE'S farm, situated in Eaton Madison, county, cannot fail to interest those engaged in either the stock raising, or dairy business, presenting as it does an example of a very successful combination of these two industrial branches.

This farm, composed of two parcels, some three miles apart, contains in all near one hundred and ninety acres. The out farm is entirely devoted to pasturing and contains seventy acres. The system adopted by Mr. Mr. MORSE, and now nearly in complete operation, is to place upon the house farm twenty cows, high grade of thorough bred Short-horns, selected with reference to their butter-making qualities, and a pure Short-horn bull. These cows average about two hundred pounds of butter annually.

The calves are all reared and as soon as they are strong enough, subsist upon the skimmed milk and butter milk from the dairy, with the addition of a little corn meal at each feeding. This keeping is not calculated to make very fat calves, the butter having been removed from it, but as the sugar and curd remain they attain an unusual size and muscular development at the age of one year;—being fed through the entire milking season, all the skimmed milk and butter milk produced, with the addition of a supply of good hay and the meal continued, till grass comes again. The size and quality of the yearlings may be judged of from the fact that last year Mr. MORSE was offered $23 a head for them *for beef;* and for his two year olds, reared in the same way—receiving only pasture during summer, and hay, straw, and a pint of meal a day the second winter—$40. His three year olds would bring $50 a head.

In this way the farm is stocked each fall with twenty each of cows, calves, yearlings, two year olds, and three year olds—in all one hundred head, beside the necessary teams. And the farm, though but a few years ago badly run down, did, during the last season of drouth and short grass crops, produce enough to summer and winter the entire stock, the meadows averaging a full three tons crop. The amount under the plow is about sufficient to supply meal for the stock during winter, and grain for the teams, and that being usually the poorest land is thoroughly manured and put down to grass.—The greatest economy is observed in preserving and augmenting the manures, that made in the stables being stored in covered, tight vaults, and the wash from the yard received in a reservoir and absorbed by muck or litter.

Several hundred loads of muck from a swamp on the farm, have been composted with the stable manure, used as a top dressing, and plowed in with decided advantage. Mr. MORSE does not consider his land as having reached the highest state, and is, in fact, rapidly improving it by deeper plowing, draining, thorough manuring, &c., tho' it was awarded the first premium by the County Society in 1850.

The farm buildings, a ground plan of which is given in the transactions of 1851, page 734, are commodious and embody several novel features worthy of imitation.—GURDON EVANS, *Utica, N. Y.*, 1853.

## THE AGRICULTURAL PRESS.

### Soiling Cattle.

*The New England Farmer* has the following remarks on this branch of farm economy:

The superiority of soiling over the common method of turning cattle to pasture, or in other words allowing them a free range, is strongly contended for by many at this day. The practice, so far as it at present prevails in this country, has been introduced from Europe, where it has obtained for a long time, and where certain peculiarities of soil, climate and population, render it far more necessary than it now is, or very soon can be, with us. Yet if it really possesses the high merits claimed for it by its advocates—many of whom are among the most intelligent and discriminating farmers and dairymen our country can boast of, it is certainly by no means to be neglected.—We have now before us as we write, the statements of many men of this class, and among the number a gentleman of Waltham, Kiddlesex Country, Mass., who had "four cows, and not a rod of ground which could be appropriated to pasturage. These animals, therefore, were never out of the barn or the barn-yard, and were fed with grass mowed for them, with green corn fodder, which had been sown broad cast for them, and with about three pints of meal each, per day. The amount of their produce was kept for thirteen weeks. Two of these animals were heifers of two years old, which had calves in the spring. The whole milk of one of them was taken by her calf during six out of the thirteen weeks. Some of the milk of the other was taken for family use, but the quantity was not determined. Under these circumstances three heifers could not be rated as more than one cow of full age and milk. From this stock, however, thus circumstanced and fed, *three hundred and eighty-nine pounds of butter* were made in the thirteen weeks! An additional pound would have given an average of thirty pounds a week, for the whole time, to a stock which must, in fairness, be set, down as three cows only."

Where the soiling system is adopted, as it is on many farming establishments—among which we may mention that of the Shakers of New Lebanon, N. Y.—the superior quantity and quality of the manure is said to be sufficient to defray all the extra expense of cutting the fodder and feeding. It is all saved, the liquid as well as the excrement, and being preserved under cover, is of great strength and energy.

In our own practice we have been obliged to resort to this mode of feeding in order to keep stock enough to produce any thing like the amount of manure we desire to use.

By keeping the cows in the barn until about the tenth of June, our eight acres of old worn out pasture (though as good eight acres of land as any farmer need desire,) affords eight cows a pretty good bite until a crop of "cow corn," put into a warm and rich piece of land as early as it is fit for the the seed, gets high and stout enough to cut. After this there is no difficulty, as a succession of crops of this highly nutritious fodder may then be obtained until October.

### Superphosphate of Lime.

FROM an article in the *Boston Cultivator*, on this important fertilizer, we make the following extract:

There is nothing to hinder farmers from preparing superphosphate of lime for themselves. For the guidance of those who wish to do so, and who are unacquainted with the method, we give a few practical hints, chiefly from the writings of Professor Way, and from a paper of the Lockerbie Farmers' Club, drawn up, we presume, by an enlightened agriculturist, Mr. Stewart, of Hillside.

A pair of substantial water-tight tubs may be got by cutting a large barrel across the middle. Into these the bones, the more finely ground the better, are put by weight. The tubs may be filled with bones to within fifteen inches of the brim. Moisten the bones with fully one-fifth their weight of hot water from the rose of a watering can, turning them over carefully so that they may be equally saturated. As soon as this is done add the sulphuric acid, in quantity from 40 to 45 per cent. of the weight of the bones. The acid must be very cautiously put over the bones, to avoid danger to the hands and clothes. As soon as practicable stir up the bones with a fork, to make sure that all the bones come in contact with the acid. In doing this stand to the windward of the tub, to lessen the danger from the effervescing liquid. After the bones have been carefully turned over, the tub may be covered with an old cloth to preserve the heat, and left twenty-four hours, by which time the process should be complete.

If raw bones are used instead of bones that have been boiled for the purpose of extracting the fatty matter and gelatine, ten per cent. less of acid will be sufficient. It is of importance to attend to this, as the acid is much the greatest ingredient, and when more than enough is used, it is completely lost—its only use being to render the phosphate soluble. Oil of vitriol is commonly used, but brown acid is more economical, though from some reason or other it is not so generally approved of. The strength of the oil of vitriol and of brown acid, or, in other words, the amount of pure sulphuric acid which either of them contains, is known by their specific gravity. In Professor Way's calculations he reckons their weight as 1-7 compared with 1 water. If brown acid be used, about a fourth more quantity is required than oil of vitriol.

Unless the bones are moistened with a larger quantity of water than half the weight of acid, they should not be difficult to dry for the purpose of sowing. Any dry absorbent substance which does not contain much carbonate of lime will do for mixing with the superphosphate after it has been a day in the tub. A layer of ashes, or, failing that, dry sawdust, may be laid on the floor beside the tub, six inches deep. Upon this layer place a quantity of dissolved bones with a spade, then another layer of ashes or saw-dust alternating with the bones until the tubs are empty. "The compound heap is now sliced down with the spade, a little at a time, and thoroughly mixed and made small with an iron rake. After having gone over it once, the same process should be repeated immediately, or at any convenient time hereafter, adding more ashes or saw-dust if it is not dry enough, after which it will be in a fit state for sowing."

In calculating the amount to be applied to the crop, if the compound contain, say a ton of bones, it may be regarded as equal to 28 cwt. of Peruvian guano. When the bones are prepared for light land, it is advisable to use a rather less proportion of acid. The process is thereby cheapened; and if small fragments of bones remain undissolved, they are highly useful in that state for sustaining the autumn growth of crop.

### Productive Farming.

IN a treatise on Productive Farming just issued from the press, the following observations occur:

It is in vegetable as in animal life; a mother crams her child exclusively with arrow root—it becomes fat, it is true, but, alas! it is rickety, and gets its teeth very slowly, and with difficulty. Mamma is ignorant, or never thinks that her offspring can not make bone—or what is the same thing, phosphate of lime, the principal bulk of bone—out of starch. It does its best; and were it not for a little milk and bread, perhaps now and then a little meat and soup, it would have no bones and teeth at all.—Farmers keep poultry; and what is true of fowls is true of a cabbage, a turnip, or an ear of wheat. If we mix with the food of fowls a sufficient quantity of egg-shells or chalk which they eat greedily, they will lay many more eggs than before. A well-fed fowl is disposed to lay a vast number of eggs, but can not do so without the materials for the shells, however nourishing in other respects her food may be. A fowl, with the best will in the world, not finding any lime in the soil, nor mortar from walls, nor calcarous matter in her food, is incapacitated from laying any eggs at all. Let farmers lay such facts as these, which are matters of common observation, to heart, and transfer the analogy, as they justly may do, to the habits of plants, which are as truly alive, and answer as closely to evil or judicious treatment, as their own horses.

## AGRICULTURAL INTELLIGENCE.

### N. Y. County Agricultural Societies.

WE are glad to perceive that the effort to establish a County Agricultural Society in *Steuben*, has been a successful one, and we doubt not the friends of improved agriculture in that fine grazing county, will take fresh courage from the fact. The following are the officers elected—among whom we recognize the names of several of the most prominent and influential citizens of the county:

President—G. DENNISTON, Prattsburgh.
Vice Presidents—1st Assembly District—O. F. Marshall, Wheeler; John B. Mitchell, Wayne. 2d Assembly District—A. B. Dickinson, Hornby; Lyman Balcom, Campbell. 3d Assembly District—Redmon S. Davis, Greenwood; John Van Wie, Howard.
Treasurer—Geo. Edwards, Bath.
Cor. Sec'y—R. B. Van Valkenburgh, do.
Rec. Sec'y—Geo. S. Ellas, Bath.

THE St. Lawrence Co. Ag. Society has elected the following board of officers for the year commencing with October next:

President—Col. ORVIS, of Massena.
Vice Presidents—Jonah Sanford, Hopkinton; Abel P. Morse, Hammond; Emery Alexander, DeKalb.
Secretary—H. G. Foote.
Treasurer—Ebenezer Miner.

The GREENE Co., Agricultural Society will hold its annual Fair in Coxsackie, on the 27th and 28th of September.

# Orchard and Garden.

## LIMA BEANS.

EDITORS RURAL:—Did you know that Lima beans ought to be planted "right side up with care," in order that they may come up and do well? Perhaps you may be aware of this fact, but possibly many of the readers of the RURAL may not be. If however, you happen to be in the dark on this question, you will of course laugh at the idea at first, as I did, and call it all humbug. But notwithstanding the palpable absurdity of the idea, at first view, I assure you it is so. I planted an acre of these beans this season, and probably not less than two hundred hills were entirely or partially ruined on account of their being planted *wrong side up!* Nearly or quite every bean that happened to be dropped into the hill with the eye *up*, was spoiled in its attempt to come up.

It happened in this way:—The roots start first (as is the case always with beans,) and grow downwards on all sides of the bean—or straddle of it, if you please—binding it down, so that when the upward shoot grows it cannot carry the bean out of the ground, but the shoot comes out doubled up in the form of a ring, and after straining itself with its utmost might to get out into the world with its burthen, it breaks in two, leaving the roots, bean and all, in the ground with their "prospects for a crop" utterly blasted.

But use a little care and place them in the ground with the eyes downwards, and no such catastrophe can befall them. If you will be particular to stop the growth of the vines by pinching them off at about six feet from the ground, there will be no difficulty in ripening them in this latitude.

Guano is an excellent manure for them, as I have learned from actual experiment. I apply to an acre the following mixture, placing a good sized handful in each hill just before hoeing: 60 lbs. of pulverized Peravian Guano, 60 lbs. of coal dust, and 120 lbs. of leached ashes. I mix them thoroughly together, three or four days before using. E. A. McKAY.

Naples, June 30, 1853

## BOILING WATER FOR THE PEACH GRUB

FRIEND MOORE:—In a late number of the RURAL, "L. N." asks at what time the "hot water" should be applied to the peach tree. In the case referred to, it was done early in spring; its effect was to kill the grubs, and secure a bountiful crop of peaches.—This season, the peaches so far as I have observed, need no stimulant, but the grub deserves scalding *at any time*, and, as MARY assured me, her trees were very much benefited by the application, I ventured a trial of it a few days ago. No effect from it is now discernable, but the *scalded* trees are as thrifty as the others; hence in treating for the grub, I infer that the present time, without regard to season, is the time for destroying them.—I. W. B., *Macedon, N. Y.*, June 20, 1853.

## DO NOT PLANT TREES TOO DEEP.

WHILE enjoying the hospitalities of a farmer a few days since, in Worcester county, he took occasion to show us his farm and garden. We observed some English cherry trees that were planted some three or four years ago, that did not appear to be growing very thriftily. The thought occurred to our mind that perhaps they were planted too deep. We obtained a hoe, and on examination, soon found our suspicion true.

The tree that appeared the most sickly, was planted more than a foot deeper than it should have been. The one that had outgrown all the others, was set more nearly as they all should have been. We no longer wondered at the unpromising appearance of his cherry trees. The marvel was, that they looked so well, after having been buried alive as it were, for so long a time.

Though the natural direction of the roots be downward, they do not extend far below the surface of the earth, usually. They grow in a horizontal rather than a perpendicular direction. The summit of the roots, which connects it to that part of the tree or plant growing above the surface of the earth is called the *Collum*, or neck. This, in planting trees, should be placed near the earth's surface.—*Amherst Express.*

## HORTICULTURAL ITEMS.

AT the Horticultural Exhibition in Boston, on Saturday, there was a curious prodigy of nature in the shape of a stalk of asparagus, about 16 inches long, nearly two inches in breadth, and less than half an inch in thickness—the whole being twisted spirally in a singular manner. It was the result of two days' growth in the garden of T. G. Gunderson, of Newton.

A Frenchman, M. Herbort, has recently exhibited some curious experiments, by which plants are made to blow instantaneously. The means used was a chemical mixture with which he watered the geraniums, which immediately began to open their buds, and in ten minutes the plants were in full bloom. With a rose-tree he was, however, less successful.

## THE PALMER WORM.—WHALE OIL SOAP.

WE make the following extracts from the *New England Farmer*, and *The Farmer's Encyclopædia*. The first gives an account of the *palmer worm*, and the latter, information and use of Whale Oil Soap:

"*The Palmer Worm*,* a wanderer, as its name signifies. This is a small worm, about half an inch in length, with many legs, and extremely nimble. It appears at different times in different parts of the country.—I have observed them however only on apple trees and oak trees, in any great abundance. They give trees the same appearance the canker worm does. They appeared in the county of Cumberland in the year 1791, about the middle of June, eating off the covering of the leaves on both sides, and leaving the membranous part entire.—The following year there were none to be seen; and I have not known them in any place two years in succession. The seeds of them may be constant, wanting only a particular state of weather to produce them.—The spring which preceded their appearance has been remarkably dry, both in April and May. The history of this little insect is so little known, that I will not undertake to say how they may be successfully opposed. I made smokes under the fruit trees, without any apparent effect. As they let themselves down by threads, they may be thinned by shaking the trees, and striking off the threads. Their ravages had not any lasting effect, for the orchards that had been visited by them bore plentifully the following year."

"A solution of *whale oil soap*, in the proportion of two pounds of soap to fifteen gallons of water, is recommended as the best known means of destroying plant-lice, and other insects injurious to plants, flowers, and fruits. It was first made known by Mr. Haggerston, of Boston, who designed it originally for the destruction of the rose-slug, and received a premium of $125 from the Massachusetts Horticultural Society for his discovery. In preparing the solution of soap, the weight required for use is to be taken and dissolved in boiling water in the proportion of a pound to a quart. Strain this strong solution through a fine wire or hair sieve, which takes out the dirt, and prevents its stopping the valves of the engine, or rose of the syringe. Then add cold water to bring it to the proper strength, namely about two pounds of the soap to fifteen gallons of water, and apply to the rose bush, or other plant, with a hand engine or a syringe, using as much force as practicable, saturating every part of the foliage. What falls on the ground will not be lost, but do much good in destroying worms and enriching the soil. From its trifling cost, it can be used with profusion, a hogshead of 136 gallons costing only about 45 cents.—The soap sells for 6 or 7 cents per pound. Early in the morning, or in the evening, is the proper time for making the application. Among other insects mentioned by Mr. Haggerston as destroyed by the solution of *whale oil soap*, are the *Aphis*, or plant-louse, which goes by the name of the brown fly; an insect not quick in motion, very abundant on, and destructive to, the young shoots of the rose, peach tree, and many other plants: and the black fly, a very troublesome and destructive insect, that infests the young shoots of the cherry and the snowball tree. "I have never," he says, "known any positive cure for this insect until this time."

See Joel, 1:4—2:25. Amos, 4:9.

## CLEAN CULTIVATION OF TREES.

THE importance of a deep, mellow soil for young trees, kept clean by constant cultivation, is well understood by skillful fruit-raisers, and should be fully appreciated by all, and acted upon at the present season of rapid growth.

Some years since, T. G. Yeomans, of Walworth, N. Y., well known as a very successful culturist, informed us that his young standard trees, which stood among his smaller trees in his nursery, where they were subjected to continual cultivation, and where the young nursery trees made but little draught on the soil, made twice the growth of those in a field of beets, which were kept hoed well through the early part of the season only, and which, precisely like a large growth of weeds, drew freely on the soil.—A similar statement is made in the Genesee Farmer, of an experiment in sowing carrots between the rows of young apple trees.—The rows of trees were 3½ feet apart and a single row of carrots was sowed between them. Although they were all kept clean during the summer, yet other trees of the same age and treatment, without carrots, made twice the growth.

The owners of orchards, in their great anxiety to get something in the shape of annual crops from the land, often lose ten times as much in the value of fruit. A certain farmer (rather *uncertain*, however, in this instance,) would not sacrifice five dollars worth of pasturage by plowing up and leaving bare the ground of his orchard, although it already afforded him fifty dollars per acre in crops, and would have paid him over one hundred per acre in better fruit and more of it, if he had only kept it mellow by plowing and harrowing. The finest market peach orchard we ever saw, in full bearing with very large and delicious fruit, was kept as mellow as an ash-heap the season through, and no crop allowed to grow upon the soil, which the proprietor found by far the best and most economical mode of management.—*Albany Cultivator.*

THE ELMS OF NEW HAVEN.—The noble elms of New Haven have this year been saved from the ravages of worms, by placing lead troughs around them with oil. Such as have been neglected are stripped as bare as in winter. The hint is worth the notice of all who have shade trees.

## A GOOD WORD FOR THE BIRDS.

IF gardeners and farmers were more fully aware how much they were indebted to birds, they would take all possible care to protect them from injury, and would encourage them in building nests, and rearing their young about their fields and orchards, instead of shooting them, because they eat the cherries and other fruits. If these persons would observe and enquire more deeply into the matter, they would become convinced, that these very birds which they are disposed to shoot as nuisances, cleanse their trees from slugs, canker worms and other insects, which, if let alone would soon destroy the tree itself. And the cultivator may be well content to pay the yearly tax of a few cherries to these guardians of his fruit trees.

Barton, the naturalist, says something to this effect, (we have not the book at hand) that we are guilty of great injustice to birds. Many of them, when seen at a distance, appear to be stealing the seed from the earth, when, in fact, they are zealously employed in grubbing up the eggs and larvæ of worms which, if left undisturbed, would destroy the grain.

Even hawks and crows, although they do indeed, eat some of the corn, and occasionally steal a chicken or two, are, nevertheless, of great use. They not only destroy multitudes of insects, but do much to preserve the purity of the air, by devouring the carcasses of dead animals.

All birds of the sparrow family, are very industrious insect-exterminators. They indeed, eat a portion of the grain from the fields, and the seed from the garden; but the injury is very slight, when weighed against the advantage of their unceasing war against all the insect tribe.

In some sections of the country, one of the most useful birds is the wren, the friend and companion of man, who delights to build his nest under the eaves, or in the nearest proximity to a quiet, human dwelling. In some places his usefulness is so well understood and appreciated, that small wooden boxes are nailed to trees, and other convenient places prepared, where they may build their nests.

As soon as the young brood are hatched, the parents begin to fly abroad in search of food for their family.

An observing lover of birds counted fifty times in one hour that one pair of wrens went forth to bring food for their nestlings, and he says they never returned without an insect in their bills. This perpetual flying forth and returning is repeated, without intermission, from morning to night, and continued till the young birds are able to fly forth themselves. In this ratio, one pair of wrens must destroy a vast number of vermin, and even if they sometimes nip the side of a strawberry, or cherry, a reasonable gardener will consider this sweet morsel but the honest due of the zealous and faithful guardians of his trees.—*American Trav.*

## THE ENDICOTT PEAR TEEES.

A PEAR tree is is standing in Danvers, Mass., which is often said to have been imported by Gov. Endicott in 1630. The public, however, are not generally aware of the facts relating to the history of the tree. C. M. Endicott, Esq., of Salem, in a communication to *Hovey's Magazine*, has gone into the matter elaborately, and has made out a strong case in support of the traditionary account, showing that this is the "oldest living and fruit-bearing tree in this country, having rounded out a period of 223 years!" Mr. Endicott adds that the American fruit trees which "approach the nearest to it in age, are the pear tree of Gov. Stuyvesant, in New York, which claims to have been imported from Holland in 1697; an apple tree of the Poarmain variety, imported into Connecticut in 1638, by Gov. Geo. Wyckey [Wyllys,] and bore fruit last season, on the "Charter Oak" place, owned by Hon. T. W. Stuart, of Hartford; the pear tree of Gov. Prince, of the Plymouth Colony, at Chatham, which was brought from England by him somewhere betweenthe years 1649 and 1545; the apple tree planted according to tradition, in 1640, at Marshfield, in this State, by Peregrine White, the first English child born in New England. After these, by dropping down more than a century of time, we find the 'Lady Petre' pear tree in Bertram's garden in Philadelphia, which is said to be 116 years of age."—*Boston Cult.*

SPECIAL MANURE FOR GRAPES.—The wine committee, at the exhibition of the Cincinnati Horticultural Society, reported that of two specimens of wine, one from grapes to which a special manuring of potash had been given, the wine from the manured grapes was "bright, clear, and mellow, like an old wine." The other was declared to be less matured in all its qualities, nor was it clear. The grapes themselves, from the two portions of ground, were also presented to the committee. "Both were delicious and well ripened, but it was considered that those from the manured land were sweeter, and that the pulp was softer."

WORKING CABBAGE PLANTS.—If you have cabbage plants set out, see that they are regularly worked, and kept free from grass and weeds. There is no liquid manure that suits the cabbage better than soap suds.—Occasional waterings with it will ensure vigorous growth, and destroy vermin. Dustings at intervals with plaster serve a good purpose.

PROFITS OF A VINE.—A late paper gives a statement of the cost and profits of an Isabella grape-vine—the cost is twenty-five cents in labor yearly in pruning and dressing, and one wheel-barrow load of manure. The profits are five to six bushels of grapes annually, and an ornamental effect in covering an otherwise unsightly out-house.

# Mechanic Arts, &c.

## LIST OF PATENT CLAIMS

ISSUED FROM THE UNITED STATES PATENT OFFICE
For the week ending June 28, 1853.

Barnabas H. Bartol, of Philadelphia, Pa., for improvement in refrigerators for cooling liquids. Patented in Cuba, Oct. 8, 1852.

Horatio Clarke, of Dedham, Mass., for improvement in bobbins.

Christopher Duckworth, of Thompsonville, Conn., for improvement in shuttle-box motion in looms.

Horatio N. Goodman, of New Haven, Conn., for improvement in Melodeons.

Daniel H. Hovey, of Kilbourn, Ohio, for improvement in machines for twisting Waxed-ends.

Edmund Morwood and George Rogers, of London, England, for improvement in coating lead with zinc. Patented in England, Dec. 12th, 1850.

Levi S. Reynolds, of Indianapolis, Ind., for improvement in bran dusters.

Christian Sharp, of Hartford, Conn., for improvement in percussion pellets. Patented in England, April 22, 1852.

E. E. Shepardson and Edwin Lucas, of New Bedford, Mass., for improvement in timing melodeons and other reed instruments.

Lauren Ward, of Naugatauk, Conn., administrator of Richard Ward, deceased, of same place, for improvement in machines for turning irregular forms.

James Foster, jr., and Platt Evans, jr., of Cincinnati, Ohio, for improvement in metallic boxes for presses, &c.

Amzi C. Semple of Cincinnati, Ohio, assignor to Wm. Semple, of the same place, for improvement in presses.

Napoleon B. Lucas, of Otter Creek, Ill., for improvement in thrashers and separators for grain.

RE-ISSUE.

Walter Kidder, of New York, N. Y., for improvement in gas regulators. Patented Oct. 12th, 1852. Re-issued June 28th, 1853.

DESIGNS.

N. S. Vedder, of Troy, N. Y., for design for a cook stove. Dated June 28th, 1853.

Samuel D. Vose, of Albany, N. Y., three designs for cooking stoves. Dated June 28th, 1853.—Ante-dated May 2d, 1853.

Samuel D. Vose, of Albany, N. Y., for design for a parlor stove. Dated June 28th, 1853. Ante-dated May 2d, 1853.

James Cowles, of Rochester, N. Y., assignor to Albert G. Bristol, of the same place, for design for a register face.

## CONDENSED HISTORY OF STEAM.

ABOUT 200 years B. C., Hero, of Alexandria, formed a toy which exhibited some of the powers of steam, and was moved by its power.

A. D. 450, Athemius, an architect, arranged several cauldrons of water, each covered with the wide bottom of a leathern tube, which rose to a narrow top, with pipes extended to the rafters of the adjoining building. A fire was kindled beneath the cauldron, and the house was shaken by the efforts of the steam ascending the tubes.—This is the first notice of the power of steam recorded.

In 1543, June 17, Blasco D. Garoy tried a steamboat of 209 tons with tolerable success, at Barcelona, Spain. It consisted of a cauldron of boiling water, and a movable wheel on each side of the ship. It was laid aside as impracticable. A present, however, was made to Garoy.

In 1650 the first railroad was constructed at Newcastle-on-Tyne.

The first idea of a steam engine in England was in the Marquis of Worcester's "History of Inventions," A. D. 1663.

In 1710 Newcomen made the first steam engine in England.

In 1718 patents were granted to Savary for the first application of the steam engine.

In 1764 James Watt made the first perfect steam engine in England.

In 1736 Jonathan Hulls set forth the idea of steam navigation.

In 1778 Thomas Paine first proposed this application in America

In 1781 Marquis Jouffroy constructed one on the Saone.

In 1785 two Americans published a work on it.

In 1789 William Symington made a voyage in one on the Forth and Clyde Canal.

In 1802 this experiment was repeated.

In 1782 Ramsey propelled a boat by steam at New York.

In 1787 John Fitch, of Philadelphia, navigated a boat by a steam engine on the Delaware.

In 1793 Robert Fulton first began to apply his attention to steam.

In 1793 Oliver Evans, a native of Philadelphia, constructed a locomotive steam engine to travel on a turnpike road.

The first steam vessel that crossed the Atlantic was the Savannah, in the month of June, 1819, from Charleston to Liverpool.—*Hunt's Merchants Magazine.*

INDIA RUBBER TIRES.—The application of a solid band of India rubber over the wheel of a carriage, so as to prevent noise and the disagreeable concussion of the wheels upon the stones, is a very valuable invention, and deserving of being extensively patronized. These tires have by experience, been found to be less expensive than iron ones, as they suffer little from friction, owing to their elasticity; they are not unsightly, greatly reduce the draught of the carriage, and add materially to the comfort of the occupant by quiet, and a freedom from all jolting or shaking.

## COMPARATIVE ELASTICITY OF WROUGHT AND CAST IRON.

THE mean ultimate resistance of wrought iron to the force of compression, as useful in practice, is twelve tons to the square inch, while the crushing weight of cast iron is 49 tons per square inch; but for a considerable range, under equal weights, the cast iron is twice as elastic or compresses twice as much as the wrought iron.

A remarkable illustration of the effect of intense strain on cast iron was witnessed by the author, at the works of Messrs. Easton & Amos. The subject of the experiment was a cast iron cylinder 10½ inches thick, and 14½ inches high, the diameter being 18 inches.

It was requisite for a specific purpose to reduce the internal diameter to 3½ inches, and this was effected by the insertion of a smaller cast iron cylinder into the centre of the large one; and to secure some initial strain, the large cylinder was expanded by heating it, and the internal cylinder being first turned too large, was thus powerfully compressed.

The inner cylinder was partly filled with powter, and a steel piston being fitted to the bore, a pressure of 972 tons was put on the steel piston. The steel was "upset" by the pressure, and the internal diameter of the small cylinder was increase by full three-sixteenths of an inch; *i. e.*, the diameter became three inches and 11-16 of an inch. A new piston was accordingly adapted to these dimensions.—and to resist the pressure; the external layers of the inner cylinder was thus permanently extended eight inches and one-fiftieth of its length. In fact it can only be regarded as loose packing, giving no additional strength to the cylinder.

Under these high pressures, when confined mechanically, cast iron as well as other metals appears, like liquids, to exert an equal pressure in every direction in which its motion is opposed.—*Clark's Britannia and Conway Tubular Bridges.*

## SAWS WITHOUT A SAW SASH.

AN improvement in the mode of hanging saws without a saw sash, and by which any amount of strain may be given them, has been constructed and the requisite steps taken to secure a patent. This improvement is the invention of Charles Burleigh, of Fitchburg, Mass. The manner in which he accomplishes this object is by attaching to the upper saw head two straps or chains, passing over straining and stationary pluleys attached to the upper part of the bed frame. These straps or chains also passing under stationary pulleys beneath the saw, and are attached to the lower saw head or block. Levers may be substituted for the pulleys, and the cords or chains attached to the top of the upper, and bottom of the lower saw head, and to the ends of the levers; by this arrangement of the inventor the saw may be perfectly strained, and the weight and friction attending the working of the ordinary saw sash or frame avoided.—*Sci. Am.*

## WATER THROUGH LEAD PIPES.

WE are frequently told of the deleterious effect upon the system, of water which passes through a lead pipe, but only occasionally are we made sensible of the extent of the danger. Several days ago a gentleman living a few miles out of the city, caught a couple of trout and placed them in a trough, the water of which was supplied through a lead pipe, intending to keep them there.—In less than three hours they were both dead. Suspicious of the reason of this sudden death, he determined to make another trial, and placed in the trough another trout. The same result followed in less time, and he made a third experiment. The result was still the same, and he considers it a settled fact that a trout, a native of the pure, sparkling stream, cannot live in a lead-impregnated water. If such water is poisonous enough to kill fishes, it cannot be without its destructive effects upon the human system.—*Manchester (N. H.) Dem.*

# Domestic Economy.

A HINT FOR HOUSEKEEPERS.—While giving to housekeepers the advice jotted down while attending to the very important matter of house-cleaning, and the like arrangements, do not omit to inform housekeepers that a few drops of carbonate of ammonia, in a small quantity of warm rain water, will prove a safe and easy anti-acid, &c., and will change, if carefully applied, discolored spots upon carpets, and indeed all spots, whether produced by acids or alkalies. If one has the misfortune to have a carpet injured by whitewash, this will immediately restore it.—*Ohio Cultivator.*

FOR PICKLING EGGS.—If the following pickle were generally known, it would be more genarally used. It is an excellent pickle to be eaten with cold meat, &c. The eggs should be boiled hard (say ten minutes,) and divested of their shells; when *quite cold* put them in jars, and pour over them vinegar (sufficient to quite *cover* them) in which has been boiled the usual spices for pickling, tie the jars down tight, with bladder, and keep them until they begin to change color.—*Exchange.*

FLY POISON WITHOUT ARSENIC.—The following preparation is much used in Europe for the destruction of flies:—Quassia, eight parts; water, five hundred parts; molasses, one hundred and twenty-five parts. Boil the quassia and water ten minutes, strain and add the molasses. The preparation can easily be made by any one. Flies are attracted by this and soon killed.

# Educational.

### COLLEGES IN NEW YORK.

The Annual Report of the Regents of the University has been received, and from it we obtain the following facts:

In Columbia College the number of undergraduates, during the year was 112, of whom 26 were seniors, 22 juniors, 34 sophomores, and 30 freshmen. Sixteen of the students were receiving their education free from all charge of tuition. Wm. A. Jones had been appointed librarian in place of Dr. Ravenhill, deceased.

The number of graduates at the last annual commencement of Union College was 65. The whole number of undergraduates during the year was 206, of whom 82 were seniors, 77 juniors, 38 sophomores, and 9 freshmen. During the past year a new building has been erected at a cost of $10,000.

Hamilton College numbered 117 undergraduates, of whom 41 were seniors, 23 juniors, 26 sophomores and 27 freshmen.—The graduating class numbered 32. By a special resolution of the Board of Trustees, tuition fees are remitted to indigent students and during the past year nearly one-fourth of the students had availed themselves of this remission.

Hobart Free College, of Geneva had, in February, 62 undergraduates. The time of Commencement has been changed from August to July.

The University of the City of New York has had, during the past year, 75 students and 21 graduates. The number who enjoyed the benefits of free scholarships was 43. At the close of the last collegiate year, Prof. Henry resigned his professorship, the duties of which are now discharged by Rev. B. N. Martin, formerly of Albany. Since the opening of the current year, Dr. Ferris has been elected Chancellor, and Professor of Moral Philosophy and the evidences of Revealed Religion.

Madison University reports the present number of undergraduates to be 93. The number of graduates 6. The philosophical apparatus has received additions and repairs, and a cabinet of minerals has been purchased by the Board.

The whole number of students admitted during the year in St. John's College, (Catholic,) was 201, and there was seven graduates at the last Commencement.

In Genesee College, there were during the past year, 84 undergraduates, and 250 receiving instruction in the college classes, but not pursuing a regular course.

The whole number of undergraduates in Rochester University was 110, of whom 18 were seniors, 15 juniors, 44 sophomores, and 5 freshmen. The number of graduates at the last Commencement was 18.

### A YOUTHFUL CUVIER.

We call attention to the fact that Cincinnati is to furnish to the scientific world one of the most accomplished naturalists of the day.

We have for some time past been much interested in a young man, a native of this city, named W. H. B. Thomas. There is nothing prepossessing in his appearnce; on the contrary — excepting a good eye — he carries an external that might tempt one *de jure* to indict Dame Nature for libel. Meeting him, perhaps among the brilliant throng on Fourth street—with *outre* gait, a verdant physiogomy in a partial eclipse from an incipient beard, a slouched hat drawn close over the forehead, the pockets of his seedy coat distended by a score of botanical preservations, fossil ferns, and geological specimens, the sombre hue of his linen advertising the death of his washerwoman — he would most likely be taken for a country lad from the hooppole region, who had ventured a trip on the canal in search of the *terra incognita* "town."

We first knew Thomas as a newspaper carrier in '48; his unusual knowledge of botany, geology, and zoology was then the remark of all. Soon after this he obtained employment as an assistant teacher in one of our schools, at a salary that barely sufficed to buy meal and coal for his aged mother. We met him again in the spring of '51, at the Cincinnati meeting of the American Association for the Advancement of Science. In the proceedings of this body he took an interest that surprised all whose observation was drawn by his eager listening and large collections of minerals, plants and fossils. Here he attracted the attention of Prof. Beard and Prof. Henry, of the Smithsonian Institute. We afterwards met him on Mound street, in this city, in the shop of a Mr. McKinley, another humble but enthusiastic devotee of science, of whom the world will yet take note, who had just finished with his own hands and rude tools a powerful telescope that Thomas was criticising.

For some months past we had seldom met with our eccentric friend, but we encountered him late last evening at the Little Miami Railroad depot. A huge blank-book, labelled "*Notes on Fossil Infusoria*," under one arm, a shirt and pair of socks under the other. He had just arrived from Washington, and had in his pocket, his *commission as Naturalist to the Kane Arctic Exploring Expedition*, which sails from New York next week. He had applied to Professor Henry for some opportunity to work in the United States Coast Survey, and that gentleman had procured his appointment to the honorable post in the popular expedition, where he will have the rarest opportunity to pursue his favorite studies, and to place his name among those of scientific discoverers.

Mr. T. leaves this evening for New York, where he joins his ship. We heartily wish him what he eminently deserves—the highest success.—*Cincinnati Com., May 20.*

### DULL CHILDREN.

No fact can be plainer than this, that it is impossible to judge correctly of the genius or intellectual ability of the future man, by the indications of childhood. Some of the most eminent men of all ages were remarkable only for dullness in their youth. Sir Isaac Newton, in his boyhood, was inattentive to study, and ranked very low in school until the age of twelve. When Samuel Wythe, the Dublin schoolmaster, attempted to educate Richard Brinsley Sheridan, he pronounced the boy an "incorrigible dunce." The mother of Sheridan fully concurred in this verdict, and declared him the most stupid of her sons. Goldsmith was dull in his youth, and Shakspeare, Gibbon, Davy, and Dryden, do not appear to have exhibited in their childhood, even the common element of future success.

When Berzelius, the eminent Swedish chemist, left school for the University, the words "Indifferent in behaviour, and of doubtful hope," were scored against his name; and after he entered the University, he narrowly escaped being turned back.—On one of his first visits to the laboratory, when nineteen years old, he was taunted with the inquiry whether he "understood the difference between a laboratory and a kitchen." Walter Scott had the credit of having "the thickest skull in the school," though Dr. Blair told the teacher that many bright rays of future genius shone through that same "thick skull." Milton and Swift were justly celebrated for stupidity in childhood. The great Isaac Barrow's father used to say that, if it pleased God to take from him any of his children, he hoped it might be Isaac, as the least promising. Clavius, the first mathematician of his age, was so stupid in his boyhood, that his teacher could make nothing of him till they tried him in geometry. Carracci, the celebrated painter, was so inapt in his youth, that his masters advised him to restrict his ambition to the grinding of colors.

"One of the most popular authoresses of the present day," says an English writer, "could not read when she was seven. Her mother was rather uncomfortable about it, but said that as every body did learn with opportunity, she supposed her child would do so at last. By eighteen, the apparently slow genius paid the heavy, but inevitable debts of her father from the profits of her first work, and before thirty, had published thirty volumes." Dr. Scott, the commentator, could not compose a theme when twelve years old; and even at a later age Dr. Adam Clark, after incredible effort, failed to commit to memory a poem of a few stanzas only. At nine years of age, one who afterwards became a chief justice in this country, was, during a whole winter, unable to commit to memory the little poem found in one of our school books.

Labor and patience are the wonder workers of man—the wand by whose magic touch he changes dross into gold, deformity into beauty, the desert into a garden, and the ignorant child into the venerable sage. Let no youth be given up as an incorrigible dolt, a victim fit only to be laid on the altar of stupidity, until labor and patience have struggled with him long enough to ascertain whether he is a "natural fool," or whether his mind is merely enclosed in a harder shell than common, requiring only a little outward aid to escape from its vigorous and symmetrical life.

### READING AND SPELLING.

We ejeculate a hearty and explosive amen to the following very sensible remarks from the Cleveland Herald, on the importance of thoroughly teaching the rudiments—spelling and reading—in our public schools. As there may be other places where these remarks are applicable, we copy them for the benefit of all concerned:

The point, however, to which we wish to direct the attention of the Board of Education, and all others interested in the proper teaching of our youth, is the rudiment—the ground work of all mental discipline—reading and spelling.

There is no such thing as a well educated person who is a poor reader, or a bad speller; and what is termed a common school education, is comparatively worthles without a knowledge of these branches.

A very general complaint exists against our present free schools, that so little attention is paid to reading and spelling; in the desire to advance children in what are misnamed the higher branches, great neglect is shown the spelling book. How ungracefully sit the accomplishments of music and drawing upon the young Miss, who begins every line of her letters with a capital! How ridiculous appears the boy, who in his letter home says "i." These are not small matters; they concern the reputation, aye, the happiness of every child in the land; and unless parents wish to send their children out into the world with a canker constantly eating into their hearts, to embitter their days by a feeling of inferiority, they must make them perfect in their spelling and reading, and teach them, at least, so much of the art of composition as shall enable them to pen a correct and grammatical letter.

---

Life is worth Living.—Life is richly worth living, with its continual revelations of mighty woes yet infinite hope, and I take it to my breast. Amid these scenes of beauty, all that is little, foreign, unworthy, vanishes like a dream. So shall it be some time amid the Everlasting Beauty, when true joy shall begin and never cease.

Strive, strive my soul, to be innocent: yet beneficent. Does any man wound thee, not only forgive but work into thy thought intelligence of the kind of pain, that thou mayest never inflict it on another spirit.—Then its work is done; it will never search thy whole nature again. O, love much, and be forgiven.

# For the Young.

### BEAUTIFUL INCIDENT.

A writer in the Times, having been at Marshfield, tells of two young elm trees standing side by side, on the farm, which were planted there by a father's hand in memory of the loved children who preceded him to the spirit-world. One morning, a few months ago, Mr. Webster had been missing from his study for an hour or more when he made his appearance with two small elm trees and a spade in his hands.—Summoning the attendance of his son, he went out upon the lawn, planted the young trees, and then turning to Fletcher said in a subdued voice, as he turned away, "My son, protect these trees after I am gone; let them ever remind you of Julia and Edward." Their sear and falling leaves now seem to typify participation in the mourning which marks this scene of sorrow. The flower garden—enclosed with a neat and ornamental wire fence, on which are trained choice rose vines—occupies nearly an acre of land east of the mansion, and contains the richest and most beautiful varieties of plants and shrubs of every description, including numerous exotics.

From the same correspondent we get another incident which we have heard before, but it will bear repetition in this connexion:

"When he (the boy Webster) first arrived at the academy of Mr. Abbott, his perpersonal appearance, in his ill-fitting, homespun garments, together with his shy, awkward manners, created much merriment among the boys, and many jokes were cracked at his expense. Young Daniel's sensitive nature could ill brook this; and, after suffering from it two or three days, he went to the teacher and told him he must go home. The teacher inquired the cause, and Daniel made a clear breast of it. The former bade him not mind it, but keep quietly at his studies, and his turn would come by-and-by. He obeyed, and at the end of *the week*, he was placed at the head of the class that had ridiculed him. After two months had passed in hard study, the teacher at the close of the school one day, called him up in presence of all the scholars, and told him he could not stay there any longer—to go and get his books and hat and leave. Poor Daniel's heart sank down to his shoes. He had studied hard, bearing patiently the ridicule of his mates, and now to be turned off in disgrace was more than he could stagger under. The teacher waited a moment to watch the astonishment of the school, and then added, "this is no place for you; *go to the higher department.*" That was probably the proudest hour in Mr. Webster's life. He had triumphed over his companions, and that by outstripping them in his studies.

### "THAT BOY I CAN TRUST."

I once visited a large public school. At recess a little fellow came up and spoke to the master; as he turned to go down the platform, the mater said:—"That boy I can trust. He never failed me."

I followed him with my eye, and looked at him when he took his seat after recess. He had a fine, open, manly face. I thought a good deal about the teacher's remark. What a character had that little boy earned. He had already got what would be worth more to him than a fortune. It would be a passport into the best store in the city, and what is better, into the confidence and respect of the community at large.

I wonder if the boys know how soon they are rated by older persons; every boy in the neighborhood is known, and opinions formed of him; he has a character, either favorable or unfavorable. A boy of whom the master can say, "I can trust that boy, he never failed me," will never want employment. The fidelity, promptness and industry which he shows at school are in demand every where, and are every where prized. He who is faithful in little, will also be faithful in much. Be sure, boys, that you earn a good reputation at school. Remember, you are just where God has placed you, and your duties are not so much given you by your teacher, or your parents, as by God himself. You must render an account to them, and you also will be called to render an account to Him. Be trusty—be true.

### LILLA'S LILIES.

Lilla, a healthy country child, ran with bare feet into the water, to gather pond-lilies for a fair lady who was strolling by.

"Ah," said the lady languidly, "would I were as brisk and happy as you! And I was when like you a careless child."

"Don't you wish," asked the simple Lilla, "that you had always remained a child!"

"I will answer you thus," said the lady, drawing a full-blown lily and a bud from the bunch she held. "The flower is mine the bud yours; and you see that the last is shut up in its thick calyx, and has no fragrance."

"But dear lady," rejoined Lilla, "do you see those many small black insects that are eating up the petals of your flower? I think I prefer to keep my close little bud, since I know that all is sound and pure inside."—*Home Gazette.*

---

"Every man," says Gibbon, "who rises above the common level, has received two educations—the first from his teachers—the second, more personal and important, from himself."

---

Listen, if you would learn; be silent if you would be safe.

All the virtues are in peril when filial piety gives way.

# Natural History.

### CROWS CAN COUNT THREE.

A few months since we were riding in a stage-coach with several gentleman, when the conversation turned upon the subject of crows, and many interesting anecdotes were related. One gentleman said he knew that crows could count—at least as far as three—for he had often proved it. Being troubled with crows in his field, he had often attempted to shoot them. But they knew what a gun was as well as he did, and therefore kept out of his reach. He then concluded to put up a small booth in the field, and place some carrion—a dead horse—within gun-shot. From this place he supposed he could fire at them when they alighted to eat. Whenever he entered the booth, the crows would all sit on the distant trees, and not one would come near till he was gone. Then all would alight, except the sentinel who remained to give warning if danger approached.

The gentleman finding this plan to fail, thought he would deceive them. So he took his son with him to the booth, concluding that when they had seen one go away, the crows would think the coast was clear, and descend to the bait. But when the son left the booth, a crow sung out *caw, caw, caw,* (there goes one,) but not a crow would leave his place.

The next day the gentleman took two persons, with him to the booth, and then let them depart one at a time. The crows on the trees saw the first and cried out "there goes one," in their own peculiar dialect. Then when the other went they cried "there goes two," but they would not light for they counted three when they entered.

The day following, the gentleman took three others with him. When they went out one by one, the crows cried "there goes one"—"there goes two"—"there goes three." And when these men were out of sight they all alighted, and the gun of the fourth man did its work.

The gentleman stated that this thing had been tried repeatedly, and it was evident that crows could count as far as three, but there their arithmetic ended. When they will ascend to the higher branch of mathematics is yet to be ascertained. In the meantime others can bring on their incidents in *crow*-nology.—*Olive Branch.*

### CANARIES AND THE BREEDING SEASON.

As this is the precise time for commencing active operations (seeing that the weather is likely to be warm and settled,) let us offer a few useful hints:—Before turning your birds into a breeding-cage, see that they be well "paired." When you have selected such colors as you approve, put the male into one cage, and the hen into another. Hang them up *dos a dos;* just so as the eye of each can come into contact, through the hole made to admit the nail. This, while it effectually works out the intended purpose, will keep you in a constant state of merriment. The antics of the birds whilst "pairing," and the vain schemes they concoct to break out of prison, are exceedingly diverting. You will often perceive their heads, or one-half of their heads, protruded through the hole; their one unceasing aim, being that of "casting sheep's-eyes" at each other! Then listen to their voices! What persuasive eloquence falls from the oily tongue of the male! What affectionate tenderness lies in the languishing responsive l-i-s-t-h-p of the bride elect! Thus are reciprocated vows of eternal fidelity, which it gives us pleasure to record, for the most part preserved inviolate. A week's dalliance brings matters to a crisis. An explanation is asked, and given. The question is popped; the lover accepted; romantic sentimentality gives way to the sterner realities of every-day life; and the sublime sinks at once into the "ridiculous."—*Kidd's Journal of Nature.*

### THE CHIMNEY SWALLOW.

In the Clinton Courant we find some interesting articles descriptive of the varieties and habits of our "winged visitors," evidently from the pen of one who cultivates a taste for ornithology. We extract the following paragraph, containing a pleasing incident relating to the Chimney Swallow:

"A few days ago, about 8 o'clotk in the evening, I was walking in a village at some considerable distance from here, when my attention was attracted by the noise of the Chimney Swallows. On the opposite side of the street a multitude of these birds were circling in the air around the top of a large chimney. They formed a regular vortex, the centre of which was the top of the chimney, and an irregular stream of the birds was pouring down, while those without still kept up their whirling flight. I stood and watched them till they all disappeared, to the number, I should think, of some hundreds, when it was all still. I started forward, but after going a few steps, I saw one solitary loiterer arrive: he whirled up and down, dove at the top of the chimney, but just as he reached it, darted up and away to the distance, and then back again, and this he did several times, as if in play, or unwilling to give up the pleasure of daylight and the open air, but at last plunged in and joined his roosting companions."

---

New Doctrines, however true, and however beautiful, never please men of the olden school. They like to fancy that the world has been losing wisdom, instead of gaining it ever since they were young.

---

Intemperance is the grossest abuse of the gifts of Providence.

# Sunday Reading.

### NIGHT SONG.

FROM THE GERMAN.

Heart, be still!
In the darkness of thy woe,
Bow thee, silently and low;
Comes to thee whate'er God will;—
Be thou still!

Be thou still!
Vainly all thy words are spoken;
Till the word of *God* hath broken
Life's dark mysteries—good or ill—
Be thou still!

Sleep thou still!
'Tis thy Father's work of grace,
Wait thou yet before his face,
He thy sure deliverance will—
Keep thou still!

Lord, my God;
By thy grace, O may I be
All-submissive, silently,
To the chastenings of thy rod;—
Lord, my God.

Shepherd, King!
From thy fullness, grant to me
Still, yet fearless faith in thee,
Till, from night the day shall spring;—
Shepherd, King!

### THE "OLD BREWERY" MISSION IN N. Y.

Quietly and unpresumingly a great reformatory work has been going on in New York city, and very recently a new Mission House was dedicated on the site of the notorious "Old Brewery,"—the centre of the worst district of the Five Points. So far the good work has progressed. A few years ago this was a nest of the foulest crimes and most degrading passions which deform human nature. It was the home of the assassin, thief, and prostitute — a den of mystery and iniquity. It is now torn away, and where it stood a Church has been erected, with a house for the preacher — with school-rooms, bath-rooms, and clean, wholesome tenements for the homeless. This change has been effected by a few earnest, pious ladies, who teach Christianity not by words alone, but by deeds,—who not only give counsel to the erring, but aid and comfort them,— taking them by the hand and leading them into the pleasant paths of peace.

The sun which now shines into this dark corner, enlightens, comparatively, a regenerated world. Many families have been rescued, many precious children saved, many seeming outcasts from all good have been taught to hope for mercy, and are leading new lives. This has been accomplished through the instrumentality of the Ladies' Home Missionary Society, and they are still, more earnestly than ever, engaged in the work. "Honor to them, if they desire it — but they do not. They solicit help, not honor. And who will honor himself by helping them?" asks a writer in the Daily Times.

The same paper says:—"The entire expense of the erection of the new Mission House is, as far as yet completed, $36,000. Of this sum, in the short space of eighteen months, $23,000 have been collected. To this some thousands were added on the day of the dedication. The building, which has been erected since December, is 75 feet front, five stories high, and 45 feet deep. The wash-room, sewing-room, and the play-rooms for the children, are not yet erected. The principal building is the Chapel, which will comfortably seat 500 persons. It is neatly fitted up, and in every way suited for the purpose for which it is intended — the worship of God by the outcasts redeemed from the streets. Adjoining the Chapel is the parsonage, where the Missionary, the Rev. Benj. F. Adams, resides. Over the Chapel are twenty tenements of two rooms each, in which poor and deserving families are comfortably located. Beneath the same is a large school-room, fitted up with almost handsome-looking desks, one for each pupil. Here eighty children will receive, not religious instruction alone, but tuition in the ordinary secular branches of knowledge, under competent teachers. Attached to the school are bathing-rooms and wardrobes. Some notion may be formed of the unflagging activity of these friends of the destitute, from the fact that within the past month over 1,000 garments have been given to the children to induce them to attend school."

Every friend of humanity is interested in this reformatory movement, and will rejoice in its encouraging success. We hope like efforts will be made in every city where there is occasion for the same, and that the hand of love and charity will seek to raise from the depths of misery, those who have sunk beyond the reach of all other help. Above all, we hope that the children of this worse than orphanage, may be cared for, and brought into the paths of virtue and respectability.

---

Knowledge unemployed may preserve us from vice; but knowledge beneficently employed is virtue.

# Miscellaneous.

Written for Moore's Rural New-Yorker.

### WENDELL.*

Wendell, Oh alas my brother!
Singing birds and summer flowers
Ne'er can call thee from that other
Happy region back to ours.
Wendell, speak but once more to us,
Tell us all we long to know,
Ope once more thine eyes and view us,
Then, Oh! then we'll let thee go.

'Tis in vain—those pale lips never
Shall give forth their music more,
Earth hath lost thy song forever—
Time, thy footsteps on its shore.
Sadly must we lay another
Of our faded blossoms by,
Close beside where rests the other,
Shall its withered petals lie.

Wendell, now we've gently laid thee
Where thy little brother sleeps,
Trees of fragrant beauty shade thee,
And the zephyr softly creeps—
Parts their leaves with gentle finger,
Waves their tresses o'er the head,
Birds, and balm, and blossoms linger
Round their wearied playmates bed.

Yes thy bed: but 'mid supernal
Song and bloom thy footsteps rove:
Wendell, in that home eternal
Thou so soon hast found above,
Wilt thou think of us who wander,
Spirit-bound with sin and fear?
Wilt thou tell the angels yonder
Of thy kindred waiting here?

Happy thought—my faith is stronger—
Brothers, sisters, dry your eyes:
Weeping Parents, mourn no longer
For your angels in the skies,
For oh! when ye've left the mortal,—
When the shadowy vale ye've trod,
*Their* fair hands may lift the portal,
They may lead you to your God. MARY.

* Killed suddenly, in Carlton, on the 11th ult., by falling beneath a roller he was using, WENDELL D., son of CYRUS and CHARLOTTE THOMPSON, aged 11 years, and 3 months.

Another grave is made within our grove of pines,
Another faded blossom sleeps therein.

For Moore's Rural New-Yorker.

### MY STUDY.

DE QUINCEY, in the Sequel to his "Confessions of an English Opium-Eater," expresses his obligations to Providence for various blessings of his early situation, and among others, that he lived in the country. With him, I rejoice that I was there born and reared, and, in addition, that I was created with an inclination to books. Taking to them as a cygnet takes to the aquatic element, and living remote from metropolitan temptations, I was shielded from many pernicious influences. My library, in youth was exceedingly small, but neighbors' hearts were large, and when unable to buy, I borrowed, and usually had a "mark" in some book. Of the garret in which my literary wares were stored, I should have spoken when writing of the "House where I was Born;" but perhaps it is worthy of separate notice. It was early dignified with the name of "Study," for there when a lad I read the "Lowell Mercury," the "Rural Repository," "Lempriere's Classical Dictionary," and the English poets generally; and there—to my shame—I fell into the wicked habit of "stringing blethers up in rhyme for fools to sing."

My study is described in part, in KIRK WHITE'S rhymed and humorous epistle to NED, in which the young aspirant to poetic bays describes *his* study. Though it could not boast of "white-washed walls and plastered floor," it was

> "So nobly large 'twas scarcely able,
> To admit a single chair and table."

There, by the way, I first read the poems of him whose name I have just mentioned; and, saving the metrical attempts of the "Rustic Bard" [ROBERT DINSMORE,] KIRK WHITE'S were the first poetical works I read. In my youthful days "Clifton Grove" and "Time," were not only long, but great poems; and the little lyric beginning with the line, "Go to the raging sea, and say, 'Be still,'" I thought must be uneclipsed. Even now, although the faults of these effusions stand out more prominently than they did twenty years ago, I love to read them for the pleasant recollections which they woke from the tomb. How true are the sentiments of JOHN FOSTER, expressed in the second letter of his essay, "On a Man's Writing Memoirs of Himself:—"Every person of tolerable education has been considerably influenced by the books he has read; and remembers with a kind of gratitude, several of those that made, without injury, the earliest and strongest impression. It is pleasing, at a more advanced period, to look again into the early favorites; though the mature person may wonder how some of them had once power to absorb his passions, make him retire into a lonely wood in order to read unmolested, repel the approaches of sleep, or, when it came, infect it with visions." With gratitude to the Great Source of temporal blessings, I recalled, while visiting my old Study, the pleasure received from reading the poetry of the pensive bard of Nottingham, and the religious impressions which such hymns as "The Star of Bethlehem," and "Through Sorrow's Night and Danger's Path," made upon my young heart.

In that little room, now in a mournfully dilapidated state, I also read the complete poetical works of SHAKSPEARE, MILTON, POPE, YOUNG, GRAY, BYRON, BURNS, BEATTIE, COWPER, COLLINS, COLERIDGE, CAMPBELL, ROGERS, SHELLEY and KEATS. For 7 years I was seriously afflicted with a poetry-reading mania; and the most acceptable benedictions of Heaven at that period, were fresh books and rainy days. Hay could not be made except when the sun shone; and I was selfish enough to wish that it would rain half the time, that I might stay within doors and read my favorite authors. CAMPBELL'S Pleasures of Hope, BEATTIE'S Minstrel and KEAT'S Endymion, afforded rare entertainment then, but they can never be *so* relished by me again. They may be read *con amore* at fifteen, but not at thirty-five.—The first perusal of POPE'S Homer and the poems of BURNS, constituted the two great jubilant epochs of my youth. The Iliad sat my soul on fire, and gave to the imagination many an Olympic flight. It was like a feast with the gods; and I still remember how the ambrosia relished. But my taste was then far, far from correct, for the most verbose passages, I regarded as the best; and I could then read them as I now read the most sublime chapters in JOB or ISAIAH.

Nearly half of BURNS'S poem, I could once repeat, but I can hardly understand why the elegies and other serious pieces, were my favorites. The days of my childhood were largely spent in the intoxication of mirth, yet the Ayrshire plowman's most congenial lyric was that plaintive one entitled, "Man was Made to Mourn." Its pathos was like nectar, and was quaffed, when I was at work in the fields alone, scores of times in a single day. Among other poems for which memory was allowed to show her partiality, are "To Mary in Heaven," "The Mountain Daisy," "Highland Mary," "The Cotter's Saturday Night," and "Tam O'Shanter." All that is refining and elevating in the more serious of these poems, my heart then absorbed as the thirsty soil drinks the afternoon shower.

I can say of the *reading* of poetry, what COLERIDGE said of *writing* it: It "has been to me its own 'exceeding great reward;' it has soothed my afflictions; it has multiplied and refined my enjoyments; it has endeared solitude; and it has given to me the habit of wishing to discover the good and the beautiful in all that meets and surrounds me." Ever will be had in sacred remembrance my old Study, for the taste for poetry therein cultivated, and the pleasures thence derived. J. C.

### AN EXQUISITE STORY.

IN the tribe of Noggdeh there was a horse whose name was spread far and near, and a Bedouin of another tribe, by name Daher, desired extremely to possess it. Having offered in vain for it his camels and his whole wealth, he hit at length upon the following device, by which he hoped to gain the object of his desire. He resolved to stain his face with the juice of an herb, to clothe himin rags, to tie his legs and neck together, so as to appear like a lame beggar. Thus equipped, he went to wait for Naber, the owner of the horse, who he knew was to pass that way. When he saw Nabor approaching on his beautiful steed, he cried out in a weak voice, "I am a poor stranger; for three days I have been unable to move from this spot to seek for food. I am dying, help me, and heaven will reward you." The Bedouin kindly offered to take him up on his horse and carry him home; but the rogue replied, "I cannot rise; I have no strength left."

Naber, touched with pity, dismounted, led his horse to the spot, and, with great difficulty, set the seeming beggar on its back. But no sooner did Daher feel himself in the saddle, than he set spurs to the horse, and galloped off, calling out as he did so, "It is I, Daher. I have got the horse, and am off with it." Naber called after him to stop and listen. Certain of not being pursued, he turned and halted at a short distance from Naber, who was armed with a spear. "You have taken my horse," said the latter. "Since Heaven has willed it, I wish you joy of it; but I do conjure you never to tell any one how you obtained it." "And why not?" said Daher. "Because," said the noble Arab, "another man might be really ill, and men would fear to help him. You would be the cause of many refusing to perform an act of charity, for fear of doing duped as I have been." Struck with shame at these words, Daher was silent for a moment, then springing from the horse, returned it to its owner, embracing him. Naber made him accompany him to his tent, where they spent a few days together, and became fast friends for life.—*Lamartine.*

MANY people complain of the evil which they suffer, and say nothing at all of the evil which they do.

SOME people want to enjoy honor, and to have the glory of despising it at the same time.

LAY by a good store of patience, but be sure and put it where you can find it.

### A CHAPTER FOR RURALISTS.

CAN anybody tell why country people so universally and pertinaciously persist in living in the *rear of the house?* Can anybody tell why the front door and windows are never opened, save on the Fourth of July and at Thanksgiving time? Why Zedekiah, and Timothy, and Jonathan, and the old farmer himself, must go *round* the house, in order to get *into* it? why the whole family (oblivious of six empty rooms,) take their "vapor bath," and their meals, simultaneously, in the vicinity of a red hot cooking range, in the dog days? Why the village artist need paint the roof, and spout, and window frames bright crimson, and the doors the color of a mermaid's tresses?—Why the detestable sun-flower (which I can never forgive "Tom Moore" for noticing) must always flaunt in the garden? Why the ungraceful prim poplar, fit emblem of a stiff old bachelor, is preferred to the swaying elm, or drooping willow, or majestic horse-chesnut?

I should like to pull down the green paper window-curtains, and hang up some of snowy muslin. I should like to throw wide open the hall door, and let the South wind play through. I should like to go out into the woods, and collect fresh, sweet, wild flowers to arrange in a vase, in place of those defunct dried grasses, and old maid "everlastings." I should like to show Zedekiah how to nail together some bits of board for an embryo lounge; I should like to stuff it with cotton, and cover it with a neat "patch." I should like to cushion the chairs after the same fashion. Then I should like, when the white-haired old farmer came panting up the road at twelve o'clock, with his scythe hanging over his arm, to usher him into that cool, comfortable room; set his bowl of broad and milk before him, and after he had discussed it, coax him (instead of tilting back on the hind legs of a hard chair) to take a few minutes' nap on my "model" sofa, while I kept my eye on the clouds, to see that no thunder shower played the mischief with his hay.

I should like to place a few common sense, practical books on the table, with some of our fine daily and weekly papers. You may smile; but these inducements, and the comfortable and pleasant air of the apartment would bring the family oftener together after the day's toil: by degrees they would lift the covers of the books, and turn over the newspapers. Constant interchange of thought, feeling and opinion, with discussions of the day, would of course necessarily follow.

The village tavern-keeper would probably frown upon it; but I will venture to predict for the inmates of the farm-house a growing love for home, and an added air of intelligence and refinement, to which they themselves might possibly be unconscious. —FANNY FERN—*in Olive branch.*

### LONGEVITY.

SPECIAL notice is often taken of a person who happens to live ninety or a hundred years, as if it were something very strange. But it seems that a hundred years is just nothing at all. Some of the early fathers lived on to six, eight, and nine hundred years; Methusaleh was almost a thousand; and this ancient custom can be revived just as well as not. The Rev. Mr. Shaw of Williamsburgh, N. Y., has found out how it can be done. According to the Sunday Messonger, he stated lately at a meeting of the Vegetarian Society, that if a strict vegetable diet were introduced, men would again live eight hundred years. That is the way it is done. Just as soon as Noah got liberty to feed on sheep and oxen, man's days began to shorten. So if you want to stay here, and see how things will move along in this great country a thousand years hence, just discard your bloody butchering and feed on grass like Nebuchadnezzer.

But why not live two thousand years just as well? What is the use of dying at all, when beans and pumpkins can be obtained? There must have been some little mistake in the case of Adam, Methusaleh & Co.; they doubtless gratified their taste with a mutton chop, or a rump steak, on some unlucky Friday, or they would have lived till this time. How unfortunate! How we should have liked to shake hands with our exceedingly great grandfather Adam, and to hear him dilate on the virtues of turnips and cabbage. Wouldn't his experience in gardening have been worth more than all the profits arising from the sale of Uncle Tom's Cabin? Oh how sorry we are that he did not stick closely to a vegetable diet! If he had hung to it with half the tenacity that some persons do to humbug, he would be here now. Oh, P-*shaw.*—*Olive Branch.*

### GEOLOGICAL CHANGES.

AN English periodical states that Sir Charles Lyell is engaged on a new edition of his Principles, which, among other matters, is to contain the sum of all we know concerning great geological changes. In connection with this subject an interesting point is raised by Alfred Taylor, who contends that the sea level, which is usually taken as the datum in geological and other scientific calculations, is by no means to be considered as permanent. He shows that the solid matters discharged into the sea by rivers would form a deposit three inches in thickness over the bottom in the course of 10,000 years, and consequently raise the level of the water by that amount. The Ganges drains 400,000 square miles, and in 1,751 years would reduce the level of that vast region by one foot. The Mississippi, which drains 1,100,000 carries one foot from the surface of the soil into the sea in 9,000 years. Thus the level of the land will be lowered, while that of the sea is raised; the latter cannot, therefore, be regarded as fixed and permanent in geological calculations.

### MEMORY WHILE DROWNING.

ONE of the most singular features in Psychology is the fact which is perfectly notorious, that the faculty of memory acquires an activity and tenacity, in the case of persons about being drowned, which it never exhibits under ordinary circumstances. An accident occurred some weeks since at New York, which threw a number of persons into the North River. Among others were Mr. ———, editor of a weekly paper in Philadelphia, and his sister. They were both finally saved. Mr. ——— describes the sensation while under water and in a drowning condition, to be pleasant, but peculiar. It seemed to him that every event of his life crowded into his mind at once. He was sensible of what was occurring, and expected to drown, but seemed only to regret that such an interesting "item" as his sensations would make, should be lost.

In noticing this statement in an exchange, I am reminded of an incident which, dissimilar as it is to the one just narrated, in its general features, had the same remarkable awakening of the memory which such cases sometimes exhibit. I can vouch for the truth of what follows, as well as testify to vivid recollections in my own case, when exposed to the hazards of drowning, reproducing in a few moments the events of my entire past life.

Some years since, A. held a bond of B. for several hundred dollars, having some time to run. At its maturity he found that he had put it away so carefully that he was unable to find it. Every search was fruitless. He only knew that it had not been paid or traded away. In this dilemma he called on B., related the circumstances of its disappearance, and proposed giving him a receipt as an offset to the bond, or rather an idemnifying bond against its collection, if ever found.

To his great surprise B. not only refused to accept the terms of meeting the difficulty but positively denied owing him anything, and strongly intimated the presence of a fraudulent design on the part of A. Without legal proof, and therefore without redress, he had to endure both the loss of his money and the suspicion of a dishonorable intention in urging the claim. Several years passed away without any change in the nature of the case, or its facts as above given, when, one afternoon, while bathing in James river, A. either from inability to swim, or cramp, or some other cause, was discovered to be drowning. He had sunk and risen several times, and was floating away under the water when he was seized and drawn to the shore. The usual remedies were applied to resuscitate him, and although there were signs of life, there was no appearance of consciousness. He was taken home in a state of complete exhaustion and remained so for some days.

On the first return of strength to walk, he left his bed, went to his book-case, took out a book, opened it, and handed his long lost bond to a friend who was present. He then informed him that when drowning and sinking, as he supposed, to rise no more, in a moment there stood before his mind, as a picture, *every event of his life*, from the hour of childhood to the hour of sinking beneath the water, and among them the circumstance of his putting the bond in a book, the book itself, and the place in which he had put it in the book case. It is needless to say that he recovered his own with usury.

There is no doubt that this remarkable quickening of memory results from the process which in such cases is going on—the extinguishment of life. It is somewhat analagous to the breaking in of the light of another world, which in so many well attested cases of death-bed scenes, enables the departing spirit, even before it has absolutely left its clay tenement, to behold and exult in the future state. Is it not a fair inference, that when the soul shakes off the clogs and incumbrances of the body, it will possess capacities for enjoyment, of which on earth it was unsusceptible?

As it regards the memory it will be observed by most persons, how readily in life we forget that which we do not desire to remember, and in this way we get rid of much unhappiness. *Can we do this after death?* This is an important practical question.—*Cist's Advertiser.*

### ELOQUENT DESCRIPTION.

THE following extract from an address of Thomas Francis Meagher, recently delivered in New York, is truly eloquent in its description of the present state of Europe.—How impossible, remarks a contemporary, for a soul not stirred and even tried in the fire, to conceive and utter such things as these:

"Austria—the whole German family—tongue-tied, the Rhine stagnant in her bed; Poland, still the Niobe of nations, and her estate and children cut up and parcelled out among the robbers; Hungary, with the knife at her proud and beauteous neck; Italy locked within her sculptured sepulchre, and a profane soldiery keeping watch upon it; France, grimacing in a masquerade, the glare of which it is the senseless and the reckless carnival; Ireland, her people decaying and disappearing faster than the ruins, even, which a ruthless civilization has yet left standing on the soil; where—where can the eye that scans the history of this day turn with joy—without grief, without vengeance, without dispair—unless it be to this great Commonwealth, the power, the progress, the immensity of which are mapped out in those mighty waters of the west, from which I came but yesterday."

THE only thing which one can do, and the only thing which any man need do, is—his "duty." 'Tis a short word, but covers a vast space. How few know it, and still fewer practice it.

# For the Ladies.

### LOVE AND TRUTH.

Love sought for Truth: a charming form drew near,
Arrayed in robes most fair; a form divine,
Upon whose brow was joy, whose eye shone clear,
And many graces here seemed to combine;
I heard the music of a sweet-toned voice,
And thought that Love might surely here reside—
Where all was Truth—and evermore rejoice,
Without a cloud to darken or divide.
But when Love ventured to lift up his eyes,
He saw that he might linger there in vain,
For all that seemed so fair was faltering Lies—
And then he fell to earth in grief and pain.
"Why should I hope?" said Love; "Truth is not there!"
And I was left to weep at Love's despair.

### DOMESTIC AND SOCIAL LIFE IN GERMANY.

IN one of our rooms this evening, the dance went on most spiritedly. Here, as everywhere in Germany, the dance is an entirely different affair from what it is with us at home. There is a life and spirit in it which contrasts most pleasantly with the solemn and measured ceremonials in our parlors in America. For the first time I gained the true idea of the dance—a musical, joyous, child-like expression of good spirits.

"What! you dance not?" said a young lady to me whom I knew well, in English, as I stood watching the merry groups.

"No, I never dance."

"Perhaps you are from the *pietistin*, who think it wrong to dance?"

"Oh, no, I like to see it very much."

"Are your country people so strict as the English in dancing and Sabbath-keeping?"

I told her I thought they were in the last, but a great many good people approved of dancing. Still we did not have *that* dance among us.

"*So!*" said she. "That is one of our prettiest dances—a Hungarian dance.—See, the gentleman *pfeift*—what call you it?--whistles!"

A Hungarian was at the piano, and he commenced a running accompaniment by whistling the air, which had a very enlivening effect.

"They say your people never play; they work always!" said she again.

"Yes; it is too true," I answered; "we make our play, work."

"But we poor Germans have nothing else than play to do," said she, with a half-sigh. "How should I like to see America! The Nature must be grand there. But then you Americans are so *practisch*," (practical.)

I said I did not think we all were; and asked her if she had read the volume of Poems, (Holmes' Poems which I had lent her.)

"Oh, yes!" said she, "I am so much obliged? There is no other poetry like it. It is utterly characteristic—so fresh and original—and how simple! remember you that of the old man?

> "And the mossy marbles rest
> On the lips he once has pressed
> In their bloom?"

"But then so practical! No German young gentleman would so write to his bride, as that one who speaks of his dollars and shillings; and his presents, which he shall not again have!"

I could not restrain a good laugh. The poem was that one of Holmes's—

> "Of my cooings and my billings
> I do not now complain;
> But the dollars and the shillings
> They will never come back again!"

I was obliged to explain to her, that to us Americans, that was the very joke.

"*Ach Gott*, I see! You are a strange people!" and she took my arm and led me into another room.

"Is it true," she asked, as we sat down together, "that your ladies in America sit still in the houses, and read, and cause the husbands and the servants to work everything?"

"Oh, no!" I answered, and then tried to explain to her the position of woman in American society.

"So! It is very different here. You see that lady across the room, very stout, with ear-rings and light hair?—that is the Frau Professor and Gorheimrath S———; but she goes down every morning and cooks in the kitchen till eleven hour. I myself divide my householding with my sister; and since six months, I have kept the accounts, and go to the markets, and look to the cooking every day over, and brush the rooms and clarify the dishes. The next six months will my sister take; and, oh! will I not be glad!"—*Brace's Home Life in Germany.*

THE LANGUAGE OF JOY AND SORROW.—We seem to be better acquainted with the misries than with the happiness of life. This is shadowed forth by the fact, that in at least the English language the words to express what is good and pleasurable are fewer by a great deal than those for the bad and painful. We have colors to paint every shade of wickedness, and strokes for every stage of woe; let the crime be the blackest, we can give it a name: let the cup be the bitterest, we can tell of the very lees. But to tell of the varying lights of pleasure, and all the winning ways of goodness, we are wholly at a loss; and the most we can say of the greatest goodness is, that there is an unknown, indescribable charm about it; the most we can say of the highest bliss, that it is unutterable.—*Dallas's Poetics.*

CONDUCT.—"I know enough about the world," remarks a writer, "to understand that one's conduct is often censured by the very persons who would have advised it had one consulted them."

MOORE'S RURAL NEW-YORKER.

ROCHESTER, JULY 9, 1853.

PUBLISHER'S NOTICES.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW-YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ ADVERTISEMENTS must be brief, appropriate to the objects of the paper, and accompanied with the cash.

### The Fourth, Here and Abroad

THE Fourth was not celebrated in Rochester by any collective, public demonstration. Had the occasion been recognized according to time-honored custom, by authorities and people, the result would probably have redounded more to the credit of citizens and satisfaction of strangers.—As it was, the chief demonstration consisted in the heterogenous "noise and confusion of the crowd which thronged the streets—each juvenile, and boy of a larger growth, acting upon his individual inclination and responsibility. The day was, truly, a *stunner*—and if *noise* is any criterion of patriotism those who "celebrated" hereabouts are prepared to defend the country (from silence) in any emergency. The weather was unusually fine, and we believe no serious accidents occurred to mar the apparent pleasure of those engaged in commemorating, according to individual taste or fancy, the National Anniversary.

In other cities, and many villages of Western New York, the Day was appropriately honored. Many of our citizens attended the celebrations at Canandaigua, Lyons, Medina, Avon, Spencerport, and other places easily reached by railroad. The Lake, Niagara Falls, Clifton Springs, and other resorts for city-sick and pleasure-seeking habitans, were also visited during the day by large numbers of our citizens.

### Opening of the Crystal Palace.

THE long-expected opening of the New York Crystal Palace is now formally announced to take place on the *fourteenth* inst, and great preparations are making for a brilliant display on the occasion.

It is announced that the price of season tickets has been placed at *ten dollars*, and that none except holders of these or invited guests, will be admitted into the interior to witness the inaugural ceremonies. The precise character of the opening exercises have not been made public, but it is to be hoped they will conform to the republican character of our institutions, and be marked by a simplicity, harmony and good taste, in keeping with the plan and execution of the edifice in which they are to take place.

Thousands will flock to the Metropolis to view this Palace, and we notice some editors have gone so far as to assume it to be the duty of every American citizen to visit the exhibition. They claim for it a National and American endorsement, whereas it is only an ill-projected and badly executed private scheme of speculation, for which neither the American people, or Government, are in any way responsible. As a show for money getting it is all very well, but as an exposition of American industry and mechanical skill it will fall below many of the fairs of the different State Agricultural Societies—the chief attraction consisting in the building itself. †

THE HARVEST.—We hear from nearly all quarters, the most satisfactory account of the incoming crops. Hay which farmers are now busy securing is not perhaps as good as had been expected, the continued rains and cold weather of May having affected it unfavorably. Wheat, for the most part, is represented as being excellent.—Some complaints are made of the ravages of the weevil, which we are assured will destroy half the crop in some localities. Whether more injurious than last year we are unable to say. From all accounts of the crop in this and other States there is no doubt the yield, as a whole, will be fully up to the average of former years, and that too of the best quality.

We hear complaints of the scarcity of hands, and if there are any willing to labor in the region of country about us, and not wanted at home, their services will be rewarded in this vicinity.

DEATH OF JOHN C. MERRELL.—It becomes our painful duty to chronicle the decease of JOHN C. MERRELL, a highly esteemed Printer and Publisher, of this city. About eight weeks since Mr. M. was prostrated by a severe attack of the inflamatory rheumatism, rendering him helpless for three or four weeks. Nearly recovering from this, he was attacked by a disease of the heart, which eventuated in his death on Tuesday morning last. Mr. MERRELL was long connected with the press of Western New York—having published papers at Geneva, Auburn and Rochester. Well known and highly esteemed, his loss will be sincerely deplored. His age was 44 years.

MUMMA'S PATENT CORN SHELLER is the best machine for the purpose to which it is adapted,—particularly when price, capacity, &c., are considered,—which we have ever seen in operation. It is simple in construction, performs its work very perfectly and speedily, and is withal durable.—Having taken some pains to examine this machine and witness its operation, we can conscientiously (as we do unsolicitedly) commend it as a desideratum worthy the attention of farmers generally. The attention of manufacturers and dealers in agricultural machinery is directed to the advertisement of the owner of the right.

## Correspondence.

### Notes from the Capital.

ALBANY, July 4, 1853.

EDS. RURAL:—Amid the "noise and confusion" attending the celebration of the "Glorious Fourth," it could hardly be expected that one could *think*, much less *indite* a proper communication for the columns of the RURAL. But I cannot resist the desire to let others know what is going on in this ancient Capital of the "Knickerbockers," even if my description should lack method or metaphors.

Of the day and its celebration I would speak at some length, if I did not know that the "Fourth of July is seen" in all parts of this great and widely-extended Republic, and is justly and fitly celebrated by her millions of worthy freemen.

The natal day of our Nation is observed at Albany by two distinct organizations—Civil and Intellectual. The civil portion occupy the early part of the day by a grand turn-out of the military, firemen, municipal officers, and the "rest of mankind," (including the women and children, q. s.) the whole concluded by the reading of the Declaration of Independence, and an Oration, in the Assembly chamber. This constitutes the "general celebration."

The Literary portion, represented by the Young Mens' Association, employ the latter part of the day, when music, poetry, and oratory are made to perform their respective parts in awakening and strengthening the patriotic emotions of the populace, or in other words, in quickening the "public pulse."

The display of military and fire companies was fine. A copious shower, early in the morning, added materially to the comfort of all concerned. The attendance of strangers was very large, and judging from the *crowd, confusion* and *powder*, I should say there was a very good degree of patriot-ism.

The exercises of the Young Mens' Association were more than usually interesting, as the presence of the Legislature undoubtedly operated as an unusual stimulus to excellence. The music was superior, being selected from the most celebrated authors, and performed by an efficient chorus of about 100 singers, and a talented orchestra. The odes were from the pen of that well-known poet ALFRED B. STREET, and were of a national and elivening character. The Poem and Oration were very creditable productions, though not superior. I dwell with pleasure on this literary part of the celebration, for societies of this kind should be encouraged in every city, village and hamlet in the land. The expenses of the afternoon celebration, which was $700, was paid by voluntary contribution from citizens. The city pays for the other portion, as well as for the fire works in the evening.

Legislative matters are dull, as both Houses adjourned from Friday last to Wednesday at noon. The last week was consumed mostly in the usual party wranglings. It is decided that the power of impeachment does *not* extend beyond the term of office to which a person was elected. This clears the old Canal Board, and it may shorten the session of the Legislature, the more desirable result of the two.

The Hunkers insisted on the passage of resolutions endorsing the Inaugural address of the President, and finally succeeded, whereupon the Free Soilers propose resolutions endorsing the Presidential appointments to office, &c., which is said to be a bitter pill for the Hunkers. So they go from day to day, one after the other.

One thing, however, is quite certain: no good can result from these indulgencies of personal prejudice and passion, unless it be to dissolve the present party ties, and force an approximate return to that political organization based on an honest *difference of opinion*. Such a division is not only desirable but essential to the welfare of the nation; but a concretion of elements into a party like the present organization, merely for the sake of the spoils of office and honor, must ever tend to corruption, anarchy and annihilation.

It is to be hoped that the members will return from the celebration of Independence with sufficient energy and patriotic zeal, to enable them to finish their legitimate business, and then go home to their constituents. But "we shall see what we shall see." *OWE.*

### Incidents of Travel Westward.—No. 7.

*Village af Franklin; effects of the speculation of '36 '7 on its prosperity—The Franklin Silk Co.; Present and future prospects of Franklin—Ravenna; remarakble fact connected with its streams—Amount of wheat and corn raised in Portage Co., also dairy products.*

RAVENNA, Portage Co., O., June, 1853.

EDS. RURAL:—En route to this place, we spent a day in the village of Franklin, situated on the Cuyahoga river. It has stood for the last fifteen years a sad reminder of the maddening effects of the speculations of '36 and '7. By some strange process, the citizens became lunatic with the idea that they could create a city that would out-rival New York and Boston, and so talked of moving up Cincinnati as a back kitchen to their splendid front. France and Italy were to suffer in competition with this place, in the manufacture of silk. For this purpose a large establishment went up—farmers in different parts of the State were induced to invest in its stocks—capitalists saw clearly that it would pay richly, and then to be able to dress from top to toe in silk—silk shirt, silk stockings, silk trowsers, and vest and coat all of silk—with charming wife and lovely daughters attired each in the same befitting fabric, this had its place among the causes which gave birth to the "Franklin Silk Company."—Lands went up from 100 to 300 per cent.; farms were cut into village lots; streets laid off and named, blocks of stores erected, and one hotel nearly as large as the Astor House in New York. Houses were built on different lots here and there, and are still scattered over some three or four hundred acres, so that in this sense they attained their object, and *became a large place*. At length the bubble burst—the Silk Company failed hopelessly, and with a crash all went down together.

Since 1851 the village shows signs of life. A large glass factory is in successful operation, and during the last year a large and beautiful building, (containing in its walls over 700,000 brick,) with slate roof and cornice, has been erected for a Cotton factory, at a cost of $25,000. Some new and costly dwellings are going up—real estate is advancing, and should the eastern end of some California Railroad pass through here, as is now anticipated, Franklin may yet out grow any previous disaster, and become one of the most thriving villages of the State.

Ravenna, the chief town of Portage County is situated on the Ohio and Pennsylvania Canal. It has no water power. Its public buildings—a Court House and Jail—are built of hammered or hewn sand stone, and it has several good Churches, two first class Hotels, one Bank, three Presses, and a population of 2,500. The Court House is situated on the highest point of land in the village, and it is said to be a fact, that the water on leaving one slope of its roof runs northward, and finds its way into the river St. Lawrence, while that from the other courses its way southward, and mingles with the waters of the Gulf of Mexico! Portage County contains only twenty towns, yet in 1851 it produced 255,000 bushels of wheat, and 329,500 bushels of corn, and its dairy products amounted to the round sum of $200,000. The corn crop occupies a territory 16 miles square, and the wheat crop an area of 23 miles square, or in other words 25,000 acres. Several hundred thousand tons of cheese are annually shipped from this point to the eastern markets.

S. B. ROCKWELL.

### State Society of Teachers.

AT a meeting of the Teachers' Association of Rochester, Messrs. WM. BARNES, W. D. ALLIS, and J. W. ADAMS were appointed a Committee to make arrangements for the State Teachers' Association to be held in Rochester on the first Tuesday, Wednesday and Thursday of August next.

The Committee have made application to the several Railroad Companies for the customary reduction of fare. They expect to receive an answer at an early day, which will be published as soon as received. All other necessary arrangements will be made.

Teachers and frends of Education in this and adjoining States are cordially invited to visit Rochester during the sessions of the State Society, and be present at its deliberations.

Female Teachers will be entertained free of charge during the meeting of the Society.

Published by order of the City Association.

J. W. ADAMS, President.

W. D. ALLIS, Sec'y.

☞ Editors throughout the State will confer a favor by publishing the above.

UNIVERSITY OF ROCHESTER.—The Commencement at this flourishing institution takes place next week. We annex the programme as announced by the Secretary of the University Board:

July 10th, Sabbath Evening—Sermon before the Judson Society of inquiry, by Rev. J. Lansing Burrows, of Philadelphia, at 7½ o'clock, at First Baptist Church.

July 11th, Monday Evening—Prize Declamations, by members of the Sophomore Class, at 7½ o'clock, at Corinthian Hall.

July 12th, Tuesday Evening—Anniversary of the Delphic and Pithonian Societies. Orator, Henry Giles, Esq., of Boston; and Poet, Alfred B. Steeet, Esq., of Albany, at 7½ o'clock at Corinthian Hall.

July 13th, Wednesday Morning—Commencement Exercises at Corinthian Hall, at 9 o'clock.

The examination of students for admission, Tuesday before Commencement, July 12th—also at the beginning of the Fall Term in September.

THE ROCHESTER SPOILS.—Are at last distributed, and no little strife and contention thereby ended. The "powers that be," at Washington, have decreed the Postmastership to H. S. ALLIS, Hunker, and the Collectorship to J. C. CAMPBELL, Barnburner. Mr. ALLIS has had many years experience in our Post Office, and ought, and we trust will, make a most efficient P. M. He has sufficient capacity, and an opportunity is now afforded for its display, where some improvement is necessary. Mr. CAMPBELL is well qualified for the station to which he has been appointed.—Both gentlemen were candidates for P. M.

THE CROPS IN ILLINOIS.—A subscriber who has resided in Whiteside Co., Ill., for the past eighteen years, now visiting in this section, informs us that the crops are unusually rich and promising in Illinois. Wheat, as well as other crops, are represented as much better than for several years past, in all the sections of the State through which he has passed. He says the farmers of Illinois are progressing—are prosperous and ought to be contented, for "their lines have fallen in pleasant places."

EPISCOPAL ORDINATION.—On Tuesday week, Bishop DeLancy held an ordination at Grace Church, in this city, when the following named Deacons were admitted to the order of Priests:

Rev. Addison B. Atkins, of this city; Rev. G. N. Cheney, of Penn Yan; Rev. G. M. Bradley, of Pulaski; Rev. C. W. Hayes, of Newark; Rev. R. N. Parke, of Hammondsport; Rev. Wm. Paret, of Clyde; Rev. J. M. Clark, of Niagara Falls; Rev. C. P. Mapes, of Lowville; Rev. James A. Robinson, of Nunda.

THE CROPS IN WISCONSIN.—A gentleman from Central and Northern Wisconsin says that the crops all throughout that region look superbly.—Wheat is fifty per cent. better than he has seen it during the eight years he has been a resident in Wisconsin. He said the only difficulty now would be, that the crops might be too heavy.

## News Paragraphs.

☞ Wool Growing is making some progress in Virginia, and farmers and planters of the old Dominion are paying considerable attention to the subject. We find in a late number of the Richmond Dispatch a notice of some samples of the Virginia grown Saxony and Merino wool, which the editor of that paper pronounces as worth, in any market, the former 88 to 95 cents per pound, and the latter 60 cents. It has been found by experience to be one of the most profitable pursuits to engage in, and the business is steadily increasing throughout the whole Piedmont region.

☞ Two thick folio volumes have just appeared, containing the numbers and distribution of the British population. To collect this information, 620 superintendent registrars, 2,190 registrars and 30,610 enumerators were employed in England and Wales; in Scotland, 1,910 superintendents and 7,878 enumerators. In the Islands of the British seas, 257 enumerators were employed. Seven million forms were printed, some of them in Welsh; and the weight of all the papers sent from the central office exceeded 52 tons.

☞ The Indians in the neighborhood of Columbia, (Oregon,) says the Columbia Gazette, eat clover with as much gusto as an epicure would devour the most dainty dish. They gather the clover in baskets, and prepare it for use by heating large stones and placing a layer of clover well moistened, between each layer of stones. It soon becomes ready for use, and each one of them will eat a supply of clover thus prepared, that would almost satisfy a horse.

☞ We regret to learn that Mrs. Julia M. Foote, wife of Hon. P. M. Foote, late Charge to Vienna, and formerly editor of the Buffalo Commercial Advertiser, died in New York, on the 27th ult. She had been indisposed, and had arrived from Europe with her husband the previous evening. This is the second bereavement of the kind Dr. Foote has experienced within four years. Mrs. F. was the daughter of the late Gen. Allen, of Batavia.

☞ The horse trade has of late years assumed an importance in Philadelphia and New York which few persons attach to it. A fact is mentioned by the Lancaster Independent Whig, which shows this strikingly. It is, that a single forwarding house in that city, Messrs. Powell & Mishler, has, since the beginning of the present year, sent 1,183 head of horses, by Railroad, to Philadelphia.

☞ Large herds of cattle are being collected in Western Texas, and driven direct to California. Such has been the demand for this species of stock of late, that it is becoming comparatively scarce. Great numbers have been driven and carried by sea out of the State, while the rapid growth of our population has increased the home demand.—*Galveston Gazette.*

☞ The Utica Herald gives some statistics, showing that the Chenango Canal, since it went into operation in 1827, has drained from the Treasury, beyond its earnings, about $65,000. Its abandonment is, therefore, advocated with permission to the Utica and Binghamton Railroad to occupy its bed, where its use is practicable.

☞ The New York Herald estimates that there are about five thousand shirt sewers in New York, who earn on an average $5,25 per week, making the aggregate yearly earnings over $900,000. It is also estimated that they average a shirt a day, which, at $2 each, would make the value of the trade something over $3,000,000.

☞ Eight thousand children in Illinois are committing the Catechism to memory, with a view to obtaining the prize of a Bible, promised the friends of youthful piety to every child mastering that formula of Christian doctrine. So says the Chicago Journal.

☞ There was a heavy hail storm on the 4th, at Auburn and vicinity. The hail lay two inches deep on the ground. Much damage was done to fruit and gardens, but more to forest and fruit trees—large numbers of both being prostrated by the force of the wind.

☞ There are now ten persons living on farms adjoining each other, on the road from Palmer to Ware, Mass., whose united ages amount to 807 years, and who were born, married, and have always lived there. None of the ten were ever married twice.

☞ The proposition to insert a clause in the new Constitution of Massachusetts, that "in all future enrolments of the militia, no distinction shall ever be made on account of race or color," was rejected in the Convention by a majority of 25,—the vote standing 74 to 99.

☞ Commander Lynch, who went on a preliminary expedition of observation to Africa, has returned, having explored all the rivers on the coast of Liberia, and found none navigable higher up than twenty miles from the mouth.

☞ It is estimated that there are in New York city 3,000 cabinet makers, 300 carvers, 400 upholsterers, and 200 chair makers. The highest rate of wages paid to carvers is said to be $25 per week, and to the other mechanics mentioned, $15.

—— At the late term of the Eclectic Medical College of Cincinnati, a diploma to practice medicine was given to Miss Caroline Brown, of Utica. She is said to be one of the most accomplished students in a class of 308.

☞ The New York Mirror intimates that there is a tin mine in the "Old Granite State," which promises to rival the best in Cornwall.—A mine of this metal in this country would be literally a mine of wealth.

☞ The members of the Canadian Legislative Assembly and Council have given to Sergeant Lawson a gold watch and family Bible, for successful defence of Father Gavazzi against the mob in Quebec.

—— The New York Mirror says Prof. Morse has sold his entire interest in the telegraph business to Hon. Amos Kendall; and that several of the leading telegraph companies are soon to be consolidated.

☞ The residents of Plymouth, Mass., will hereafter celebrate the embarkation of the Pilgrims from Delft Haven in August, instead of the landing. The first celebration will take place this year.

☞ Prof. Silliman says that the aggregate destruction of human life, annually, in this country, from the use of burning fluid and camphene, is greater than by all the accidents with the steamboats and railroads.

☞ The great military encampment at Syracuse, in August, will be one of the grandest affairs of the age. There will probably be over 30 companies present, and no less than six from this city.

—— A gentleman, who three years ago bought one-third of John Brown's Tract for $5,000, a few days since sold out his interest in it for $38,000. Not a bad speculation.

## News Brevities.

—— None of the delaine factories in Rhode Island have prospered.

—— Ole Bull is fitting up a concert room at his residence in Potter Co., Pa.

—— Nine thousand emigrants arrived in New York in two days last week.

—— A grand park, comprising some 50 acres of woodland, is projected at Cincinnati.

—— Counterfeit American quarters of the stamp lately issued by the Government are said to be in circulation.

—— Cotton is now being cultivated with success in Greece. It will also be probably introduced into Algeria.

—— Ripe apples of this year's growth, from Virginia, have arrived at New Haven, by a schooner.

—— Miss Bronte, the authoress of Jane Eyre, Shirley and Villette, is reported as coming to this country shortly.

—— There are 3,000 straw sewers in New York city working for five months in the year, and turning off 1,200,000 hats and bonnets.

—— The Daily expenses of the N. Y. Legislature are about Fifteen Hundred Dollars. This sum does not include any *stealings*.

——George Peabody, Esq., the American banker in London, is said to be worth about five millions of dollars.

—— A gentleman in Buffalo offers to take that city's subscription of $150,000, in the Buffalo and Brantford Rail Road, at a premium of $500.

—— Isaac Butler, a poor man of Vernon, N. Y., has fallen heir to $94,110, in Norway, of which country he is a native.

—— The railroad warehouse at City Point, Va., together with several adjoining buildings, was burnt on Monday week. Loss $30,000.

—— Mr. Van Buren's arrival in England is announced in all the Paris journals. He is well received wherever he may appear.

—— The late bills of mortality indicate 1,100 deaths a week in London. That is 157 a day, or 6½ an hour.

—— Commodore Stewart is 73 years of age.—He has been long and actively engaged in the service of the United States.

—— The revenue of Peru is eight millions of dollars, of which five millions are derived from the sale of guano.

—— There was a frost, says the Hartford Courant, in East Stafford, Connecticut, on Sunday morning, the 26th ult.

—— Thirteen head of cattle and sheep, now on exhibition in New York, have been sold to J. M. Bishop, of Vermont, for seventeen thousand dollars.

—— The City Marshal of Bangor recently seized twenty barrels containing liquor, while landing from a schooner. The vessels containing the liquor were packed in flour barrels.

—— Michael Irwin was instantly killed in Pittsburg, by the falling of a swing sign. There are too many of the sort in every city for the safety of pedestrians upon the side walks.

—— There is a fig tree growing in the open air at Charlestown, Mass., on which are forty-eight figs nearly ripe. The tree is about eight feet high.

—— James A. Ingram, of East Bradford, Pa., says he has a duck which has laid 105 consecutive days, and still continues producing an egg each day.

—— The annual meeting of the New York State Teachers Association will be held at Rochester on the first Tuesday in August, and continue three days.

—— The Common Council of Detroit has passed a resolution tendering to Hiram Powers, the great American sculptor, now about to return from Europe, the hospitalities of the city.

—— An express train on the Pennsylvania Road, a few days since, ran ten miles in seven minutes and a half. This is at the rate of eighty miles an hour!

—— Joseph Cottle, well known from his connection with Coleridge, Wordsworth and Southey, and his literary labors, died recently, at the age of 84 years.

—— W. D. Porter, U. S. N., contradicts the report that Amin Bey, who visited this country a year or two since, as agent of the Turkish Sultan, was an impostor.

—— California has adopted the New England system of public schools. There are now about 18,000 children of the proper age to attend, and the school fund amounts to $200,000.

—— Owing to the late bleak weather in the country, the hop crop of England is exceedingly backward, and is very far from exhibiting a healthy appearance.

—— It is stated that during the year 1852 a total quantity of 1,054,000 tons of vessels sailed from Newcastle, England, with coal, to 311 foreign ports, in different parts of the world.

—— The New York Grocers' Steam Sugar Refining Company are erecting a sugar refinery which is to cost $600,000, and which will, when completed, turn out 1,000 barrels sugar a day.

—— A company of over two hundred Norwegians came up from Quebec recently bound for Milwaukee. They are of the better sort of emigrants, being well to do in the world.

—— The Buffalo Courier learns from the clerk of the Board of Health, that the reports thus far this season, exhibit a more healthy condition of that city than for the last seven years.

—— Hon. Gerrit Smith, M. C., lies seriously ill at his house in Peterboro, having recently undergone a very serious and painful surgical operation.

—— The New York Herald has an interesting statistical article upon the Barbers of that city.—There are 1,500 in all, of which two thirds are Germans.

—— The Newport Mercury, still published, was first issued by Ben Franklin's brother James, on the 12th of June, 95 years ago, on a sheet 12½ by 16 inches.

—— Mr. Wm. Ely, and his wife, lately died in Lee county, Virginia. The former was 105 years old, the latter 107. They have been married three quarters of a century.

—— The Syracuse Journal says that a girl who knew nothing of the printing business, learned the boxes on Monday and set up half a column of matter on Tuesday last.

—— James McGuire has been convicted of the murder of J. W. Holland in Syracuse some months ago, and sentenced to be hung on the 17th of August next.

—— The New York and New Haven Railroad Company have paid the sum of $5,000 to Mrs. M. W. Dimock, Mansfield, whose husband was among the killed by the Norwalk disaster.

## Severe Thunder Storm in New York.

A VERY severe thunder storm occurred in New York city and vicinity on Friday evening last, doing immense damage to property and causing the death of several persons. The following is the telegraphic account of the disaster:

Dr. McLean's Church in South street, and the Dutch Reformed in 4th street, were almost demolished. The Methodist, in Leonard street, the Catholic Church, in Grand street, were unroofed and otherwise damaged. Three rope walks were completely destroyed. An immense quantity of glass was broken by the hail, which fell as large as hens' eggs.

At Williamsburg, many houses were unroofed, thrown down, or otherwise damaged. A thunder gust passed over the upper part of Williamsburgh, doing great damage.

A large building belonging to Mr. Townsend, on which 40 or 50 men were at work was blown down, and several persons killed and injured.—Three were taken from the ruins dead.

The Crystal Palace was much injured. The glass was broken by the hail; iron works bent, and a good deal of damage done by the water.

A building in course of erection on 9th Avenue was blown down and several workmen injured, and one man who was passing instantly killed.

The lightning struck in various places. A thunder bolt struck in a lumber yard in Williamsburgh, scattering the board in all directions.—Several persons were severely injured by being struck by hail stones during the storm.

In the course of the evening a man named Conrad Deitz was struck, in New York city, while walking on 10th Avenue and instantly killed.

## Late Counterfeits.

5's on the City Bank, Buffalo, N. Y., altered from ones—vig. a sailor boy sitting on a ship's deck holding an eye-glass in his hand.

10's and 20's on the City Bank, Buffalo, N. Y., altered from two's—vig. an Indian queen looking over a distant city, with a river, canal, railroad and steamboats—said to be admirably done.

5's on the Bank of North America, Conn.—vig. large figure 5 with two female figures—Washington on right end—head on the left end—figure 5 each side of vig.—not like genuine.

10's on the Bank of Geneva, N. Y., altered from 1's—vig. man, &c.,—Washington on the right—well done.

10's on the City Bank, Hartford, Conn.,—letter C—said to be an excellent imitation.

1's on the Bank of America, N. Y. city—vig. a female, vase of flowers, &c.,—steamboat on the right end—State arms on the left—unlike the genuine.

3's on the Merchant's Bank, Naples, N. Y.,—spurious note—vig. eagle—head of Franklin on the left—Washington on the right—engraving, filling up and paper bad.

## Labor in Virginia.

A WASHINGTON correspondent of the New York Journal of Commerce, who has been on an excursion down the Rappahannock says:

"I noticed that labor appeared to be scarce and high, and there is, in fact, a general complaint in Virginia, of the scarcity of labor—owing to the emigration of so many proprietors with their slaves. Good cradlers, whether black or white, commanded readily two dollars a day,—a high price in proportion to the low rate of the produce market. Looking at the character of the labor in the harvest, I could but notice a great change within the last thirty years. There is among the slaves, more of free black and much more of white labor than formerly. A few foreign laborers, German and Irish, are, it is said, now coming into the country.

It is very clear to me that the time is to come, and is not very far off, when in this part of the country, slaves will be retained chiefly for house servants, while labor in the field, as well as in all mechanical employments, will be free, and, for the most part, white."

A NOBLE MONUMENT.—To honor the memory of the late Duke of Wellington, a magnificent School is to be established, at which children of Army officers are to be admitted free of charge. The Queen heads the subscription with $5,000; Prince Albert and the Duke of Cambridge (the Queen's uncle) follow with $2,500 each; and there are several subscriptions ranging from $500 to $1,000. The entire subscription already amounts to $100,000, and will probably be increased to 500,000. Isn't this better than a pyramid of useless granite?—*N. Y. Tribune.*

☞ By the 20th ult., ten days before the expiration of the second quarter of the year, the accounts of about all the postmasters in the United States, upwards of twenty thousand, were received at the General Post Office. Each return was opened, the balance recorded, and other action thereupon, preliminary to its being sent to the Auditor for settlement on the 23d inst., one hundred and sixty bags of valueless dead letters were destroyed at Monument Place. About nine-tenths of all the money found in dead letters is now restored to its lawful owners by the Department.

ANTE-NUPTIAL DEBTS.—The Legislature of New York passed a law at its recent session exempting the property of the husband from the debts of the wife which may have been contracted before marriage. The same body passed a law in 1848 exempting the property of the wife from being taken for her husband's debts contracted before marriage.

THE WINE CROP OF THE UNITED STATES.—In 1840 the wine crop of this country was 124,000 gallons. In 1820 it was 221,246 gallons, being an increase of almost a hundred per cent. in ten years. The amount imported last year was 6,160,000 gallons—an amount which our country will be able to supply for its own consumption in six years, even at the present rate of increase.

THE CAYUGA MARSHES.—The Board of Land Commissioners have appointed William A. Perkins, under the general direction of the State Engineer, to make critical examination of the obstructions in Seneca river, and report a plan for removing them, so that the Cayuga marshes may be effectually drained.

THE FASTEST YET.—An Express Train on the Pennsylvania Rail Road, a few days since, ran ten miles in seven minutes and a half. This is at the rate of eighty miles an hour! It is needless to say that the ten miles of road was perfectly straight and level.

☞ The proposition for a Constitutional Convention did not succeed in the Connecticut Legislature.

## Frequency of Earthquakes.

A CORRESPONDENT of the New York Courier, who keeps hourly thermometrical observations, says that earthquakes produce changes in the atmosphere that rests upon the earth, and exert an influence upon it to a greater and wider extent than persons who are not in the habit of observing the phenomena in conection with atmospheric changes have generally supposed. He remarks:

"Within the field of our research, during a period of fifteen months, commencing with January, 1851, and ending with March 1853, (four hundred and fifty-five consecutive days,) we have recorded earthquakes that have been active on one hundred and seventeen of these days, on each of which the place and places where the earthquakes were felt are particularly stated, and the day of the month also. In addition to these thus particularly specified, we have recorded many earthquakes during the same fifteen months: the places where they were felt are stated, but the day of the month could not be ascertained from the published accounts; and others also, in considerable numbers, where neither the day of the month or the month of the year is mentioned, but which were within the said fifteen months.

The field of our research embraces but a small portion of the globe. Large districts of our earth are uninhabited, and of the inhabited districts there are many where there are no intelligent minds to observe and make record of the phenomena, and others where there are no newspapers to convey intelligence.

The conclusions we have arrived at from these observations, made without any interruption for a series of years, is that all the great and sudden changes of the temperature of the atmosphere are produced by the earth, and these changes affect those who breathe it both physically and mentally, to a greater or less extent."

## N. Y. State Agricultural College.

THIS Institution was chartered by the Legislature of the State of New York, for the purpose of presenting to Agriculturists the means for acquiring a knowledge of the Arts and Sciences appropriate to their vocation; to prepare Students for practical, active labor, by training the mind in a system which shall inculcate an intimate acquaintance with the sciences essential to agricultural success.

To insure the development of principles and their application to the soil, the Legislature has required the purchase of not less than three hundred acres of land.

The Trustees, having accepted the trust confided to them by the Legislature, organized the State Agricultural College, by the following appointments:

JOHN DELAFIELD, President of the College.
HON. JOHN A. KING, Ch'n of the Board of Trustees.
JOEL W. BACON, Secretary.
N. B. KIDDER, Treasurer.

At a meeting of the Board, on the 4th of June, a Report was presented by B. P. Johnson, from a Special Committee, on the Location of the College, declaring "that after an examination of the Oaklands Farm in Seneca County, they are entirely satisfied that the price asked for it, is its fair value in the market, for farming purposes, that it is, by previous preparation, by position and variety of soil, in every respect adapted to the objects of the Institution; that the title is perfect, and recommend that the chain of title be entered at large on the minutes of the Board," &c. This farm is situated midway between the market towns of Waterloo and Geneva, and in full view of the Seneca Lake, and overlooking the village of Geneva; elevated about 125 feet above the lake, it is free from causes disturbing health; its soil varies from a strong clay to a sandy loam, presenting varieties sufficient for testing by experiment every doubtful question in relation to soils, and to exhibit the most approved system of cultivation.

The Trustees are prepared to receive from Farmers and friends of agriculture, proposals for the Capital Stock of the Institution, which will be distributed in shares of fifty dollars each, payable

10 per cent on Subscribing.
40 " 1st July.
50 " 1st October.

The Trustees may be addressed (post-paid) at their respective residences, as follows:

HON JOHN A. KING, Jamaica, Queens County.
HENRY WAGER, Westernville, Oneida "
B. P. JOHNSON, Agricultural Rooms, Albany.
WM. KELLY, Rhinebeck, Duchess Co.
N. B. KIDDER, Geneva, Ontario Co.
JOEL W. BACON, Waterloo, Seneca Co.
TALLMADGE DELAFIELD, Geneva, Ontario Co.
WM. BUEL, Rochester, Monroe Co.
JOHN DELAFIELD, Oaklands, Seneca Co.

The Officers of the College will endeavor to present subscription books in each County, that the College, so entirely agricultural and peculiarly the Farmer's institution, may find its support widely diffused throughout the State.

The President will, upon application to him, give all needful information in relation to the ordinances, rules and regulations of the College, and the courses of instruction to be pursued.

By order of the Board of Trustees,
JOEL W. BACON, *Secretary.*

### BOOKS FOR PREMIUMS!

PERSONS entitled to Premiums in Books for obtaining subscribers to the RURAL NEW-YORKER, will please select from the following list of works. If any wish books not mentioned in this list we will furnish them at the regular cash prices.

Johnstou's Ag. Chemistry, $1,25; Boussingault's Rural Economy, $1,25; Downing's Fruits and Fruit Trees of America, $1,50; Amer. Fruit Culturist, by Thomas, $1,25; Dictionary of Gardening, by Johnson, $1,25; Farmer's Dictionary, by Gardner, $1,75; Farmer's Every-Day Book, by Blake, $2,50; The Complete Farmer and Gardener, by Fessenden, $1,25; Rural Architecture, by Allen, $1,25; Ladies Companion to the Flower Garden, by Mrs. Loudon, $1,25; American Flower Garden, by Buist, $1,25; American Farm Book, $1; The Kitchen Garden, by Buist, 75c.; Continental Agriculture, by Colman, $1; Scientific Agriculture, by Rodgers, $1; American Lady's System of Cookery, by Mrs. Crowen, $1,25.

Youatt on the Horse, by Randall, $1,50; Youatt and Martin on Cattle, by Stevens, $1,25; Randall's Sheep Husbandry, $1,25; Morrell's American Shepherd, $1; Canfield on Sheep, $1; Youatt on Sheep, 75 cts.; The Pig, by Youatt, 75 cts.; Clater and Youatt's Cattle Doctor, by Skinner, 50 cts.; American Veterinarian, by Cole, 50c.; The Dairyman's Manual, $1; Browne's Poultry Book, $1; Bennett's do., $1; Bee-Keepers Manual, $1; Townly on Bees, 38c.

The above works are all well bound, in muslin or leather, and mostly of late editions and finely illustrated.

The following works are bound in paper, pamphlet style, and furnished at 25 cents each:—Elements of Agriculture; Dana's Essay on Manures; Every Lady her own Flower Gardener; The American Kitchen Gardener; Amer. Bird Fancier; Amer. Rose Culturist; Pests of the Farm; The Horse; The Cow; The Hog; Domestic Fowls and Ornamental Poultry; The Hive and the Honey Bee.

**The Wool Grower and Stock Register,**—Contains the most USEFUL and RELIABLE information on Wool, Stock, &c., and should be taken by *every owner of Domestic Animals*, whether located East or West, North or South. Published monthly, in the BEST STYLE—illustrated with Portraits of Sheep, Cattle, Horses, Poultry, &c., &c. The Reviews of Wool and Cattle Markets are reliable—alone worth many times the price of the paper, which is

ONLY FIFTY CENTS A YEAR—Five copies for $2; Eight for $3, &c.,—*in advance*. First four, bound in paper, and fifth volume as issued, for $2. Premiums offered. Specimens, Premium List, &c., sent free.

☞ The Fifth Volume, *enlarged*, commences July, 1853. Now is the time to subscribe. Money or postage stamps at our risk, if properly enclosed and addressed to

June, 1853. **D. D. T. MOORE,** Rochester, N. Y.

## Market Intelligence.

RURAL NEW-YORKER OFFICE,
Rochester, July 6, 1853.

FOR the week past the market presented no unusual animation. With the great mass of American people, the National Anniversary absorbs for a week at the time at which it occurs, so much of time and attention, little else is thought of or done.

This is especially true of many farmers who are among the most patriotic of our citizens. Thrones have visited the city, but very few of the number were on business it tents and very little heavy produce has been brought forward.

FLOUR—The trade continue to take all the small lots offering from country mills at rates heretofore named. The trade is not brisk.

GRAIN—But little wheat has been offered, effecting no change in prices. $1.17@1.18 is the limit of the market for prime Genesee, at which prices it sells readily. Corn is scarce and wanted at 63@65c. Oats sell in small parcels at 40@42c.

PROVISIONS.—Very few sales of barreled or cut meats, and no change in prices to note. Market household supplies are abundant. Butter plenty at 12½c per lb.; some extra rolls bring more for family use. Eggs are sought for at 11c per doz. Potatoes abundant at 25@31c per bushel.

BEEF CATTLE.—The supply of grass fed is moderate, and is purchased at $4,50@5 to $5.50 as in quality. Stall fed is scarce, and brings $5@6 per hundred.

SHEEP AND LAMBS.—Very few fat sheep are offering.—Lambs are found with difficulty and bring from $4,50 to $2,25.

WOOL.—The season is drawing to a close. The supply has been limited with not quite the usual number of buyers. Competition has not been brisk, though prices have been well maintained. The range has been from 40 to 55c, and in some instances a shade better.

### Rochester Wholesale Prices.

| | | | |
|---|---|---|---|
| Flour, bbl. | $4.75@5.25 | Butter, lb. | 12@12½ |
| Pork, mess, | 15,00@15.50 | Cheese, | 8@9 |
| Do. cwt, | 6.50@7.00 | POULTRY. | |

### NEW YORK MARKET.

NEW YORK, July 5.

ASHES.—Steady market for pots, $4,75; Pearls firm, $5,12.

FLOUR—There is less firmness in the low grades of State and western flour. Only a moderate local demand. Canadian not plenty, and prime $4.75. Few sales $4.62@68 for common to straight State; $4,62@$4 for mixed to fancy Michigan, Indiana and Wisconsin; $4,68@80 for common to good Ohio. Rye flour and corn meal steady and quiet.

GRAIN—Wheat steady, and in good demand for export. Supply limited. Sales good to choice white Ohio and Michigan, 1,21½@1,23; red Ohio 1,12½ mixed to prime white Canadian 1.19. Rye quiet. Sales 87c. Oats lower. Sales State and western 40@41. Corn better, and in good demand for the home trade. Sales 56½@71½ unsound; 63@61¼ for southern mixed; 64½@66 for do white; 69@69½ for do yellow; 67@68 for western mixed.

PROVISIONS—Demand for pork moderate and market steady. Sales mess and prime relatively light. $15,50 for mess; $12 62 for prime. Prime mess quiet. $15. Beef in fair request and less plenty, $8@10 for country mess; $5@5 25 for country and city prime.

LARD—quiet but firm, 8¾@10¾c.

BUTTER—In good demand and not plenty, 10½@15c for Ohio; 15@18c for new State.

CHEESE—Saleable 6@8c.

### NEW YORK CATTLE MARKET.

NEW YORK, June 27.—At Washington Drove Yard—At market, 2,500 Beef Cattle; all from the South and West. Rain this morning had effect to check the business to some extent, market closing rather dull. Prices of poorer qualities a fraction lower, sales having been made at 8c.; about 300 head left over.

At Browning's—In market 3,500 Sheep and Lambs.—all sold at $2,50@4 to $7 for Sheep, and $2,25@3,75 to $6 for Lambs.

Cows and Calves—100 offered, and all sold at from $22,-50@35 to $50.

At Chamberlain's—Offered, 350 Beef Cattle—Prices ranging from 8 to 9½c.

Cows and Calves—70 offered, and sales at $22,50 to $35 @50.

Sheep and Lambs—3,600 offered, all sold at from $2,25 to 3,25, 4,25@5 for Sheep, and $2,25@3,50 to $5 for Lambs.

### CAMBRIDGE CATTLE MARKET.

CAMBRIDGE, June 20.—At market, 787 Cattle, about 650 Beeves, and 137 Stores, consisting of Working Oxen, Cows and Calves, yearlings, 2 and 3 years old.

Prices—Market Beef—Extra sold at $8 per cwt.; 1st quality, $7,50; 2d do, $7,00@7,25; 3d do, $6,75; ordinary, $5,50@6,50.

Hides—$4,75@5 per cwt.

Tallow—$7@7.50 per cwt.

Pelts—75c@1,50.

Calf Skins 11c per lb, quick.

Barreling Cattle—None.

Veal Calves—$3,25@8; 416 at market.

Stores—Working Oxen—$88, 94, 97, 102, 116@158.

Cows and Calves—$20, 24, 28, 31, 45 to 52. At market 56.

Yearlings—$10, 11@11,50.

Two years old—$25, 26, 30, 30@36.

Three years old—$37, 40, 42, 45@54.

Sheep and Lambs—2,033 at market, and 1,500 more sold from Maine steamboats.

Extra, $4, 4.50, 5@6.

By lot—$2, 2,50, 2,75 3, 3,25.

Swine—69 large still fat, at 6c. per lb.

### BRIGHTON CATTLE MARKET.

BRIGHTON, June 30.—At market 875 Beef Cattle, 30 pairs Working Oxen, 60 Cows and Calves, 4,800 Sheep and 950 Swine.

Prices—Beef Cattle—There is a large stock and prices have declined. Extra, $8@8,25; 1st quality $7,25@7,75; 2d do. $6,75@7; 3d do. $5,50@6,50.

Working Oxen—Sales $70, 82, 95, 98, 100@110.

Cows and Calves—Sales $23, 28, 31, 38, 40@55.

Sheep and Lambs—Sales $2,75. 2,88, 3,25, 3,75, 4@4.50.

Swine—Spring pigs 8¾, 9@9¾c. per lb.; Ohio shats 6¼ for sows, 7½c for barrows. At retail 6½ to 8½c.

### PHILADELPHIA CATTLE MARKET.

PHILADELPHIA, June 30.—There was an active inquiry for Beef Cattle, and prices were fully sustained.—2,000 head offered, 600 of which were driven to New York and the balance sold to city butchers at $8 to $9,50 per 100 lbs., the latter price for extra quality.

Cows and Calves—Sales of 360 head at $18@35 for milch cows, springers $14@25, and dry cows $7@13.

Hogs.—There were a larger number in market than usual. Sales of 1,500 head at $6 to $6,50 per 100 lbs.

Sheep and Lambs—800 head sold at $2 to $6 each as in quality.

### SUPERPHOSPHATE OF LIME.

THE undersigned continue sole agents for the sale of Deburgs Superphosphate of Lime, which has proven Superior to all other brands, now in the market. Having sold nearly Three Hundred Tons this spring, and heard from a majority who have used it, they pronounce it equal to Guano in its effects, and is more lasting in the soil. As there are many substances called Superphosphate of Lime now offering in this market, which are of a different nature, to avoid impositions purchasers would do well by applying direct to the agency for their supply.

LONGETT & GRIFFING,
174-8w. No. 25 Cliff Street, New York.

### SUFFOLK PIGS FOR SALE.

TWENTY PAIRS of pure bred *Suffolk Pigs* for sale by the subscriber. They can be safely forwarded by Railroad, Express, &c., to almost any part of the country.

Address C. J. HOLDEN,
June, 1853. [182-2t*] Walepole, N. H.

WHEN CORN'S PLANTED, WEEDS BEGIN TO START.—Get a good Cultivator, made to expand or contract to suit the times. They are death on weeds; and without elbow grease, will keep the soil mellow, and fill the crib in Autumn. Sold at
177tf HALLOCK'S 24 Exchange st., Rochester.

### MUMMA'S PREMIUM CORN SHELLER.

THIS Sheller is perfectly simple and durable in its construction, and shells the ear clean from point to point and separates the cob from the corn. It is adapted to hand or horse power, and is capable of shelling from 30 to 40 bushels per hour. It has been awarded the highest Premium at several State Fairs, and gives universal satisfaction among the farmers where introduced.

With a very slight alteration it can very easily be converted into an excellent apple or root grinder.

The subscriber having purchased the Patent Right of the above Sheller for all the United States and Territories, will sell County or State rights on reasonable terms.

One of these Shellers can be seen at the World's Fair in New York, during the Exhibition. E. ROBINSON.
Greencastle, Franklin Co, Pa., July 5, 1853. 184-1t.

### REAPING MACHINES.—IMPORTANT INSUNCTION.

JUDGE NELSON, of the Supreme Court of the U. S., granted at Cooperstown, on Friday, the 24th ult., an injunction against SEYMOUR & MORGAN, of Brockport, restraining them and their agents from disposing of their wheat Reapers as an infringment of my patent. Purchasers of machines make themselves liable to prosecution by using them. C. H. McCORMICK.

☞ Mr. McCORMICK has recently obtained a renewal of his patent, including the reel. Manny's Reaper is as decided an infringement of his patent—subjecting the manufacturer and purchaser of it to the same penalties.
June 29, 1853. 183tf.

*HALLOCK'S*
### AG'L WAREHOUSE AND SEED STORE.
*No. 24 Exchange St., Rochester, N. Y.*

THE subscriber, late from the Establishment of Emery & Co., Manufacturers at Albany, where he has been engaged for the past six years, has been appointed their SOLE AGENT in Rochester and West in New York, for the sale of

*Emery's Celebrated Railroad Horse Powers and Threshing Machines; Circular and Cross-cut Saw Mills, Feed Mills, Corn-stalk and Hay-Cutters, &c.,*

adapted to the Power, and now offers them at manufacturer's prices, with the transportation added, and subject to the warrantee, as follows:—"To work to the satisfaction of purchasers as represented in Circulars and Catalogues, or to be returned within three months, and full purchase money to be refunded." The attention of Farmers is solicited, and a careful investigation into the construction of this Power, and its comparative merits, as well as price requested, before purchasing elsewhere. He is also agent for their

**Combined Reaper and Mower.**

and keeps constantly on hand, Plows, Hay Cutters, Corn Shellers, Seed Planters, &c., &c., comprising a complete and extensive stock of Agricultural and Horticultural Implements generally, together with a full assortment of Field and Garden Seeds, of the best Imported and Shaker growth.

He is also agent for the sale of Seymour and Morgan's New York Reaper, Pierpont Seymour's Grain Drills and Broad-cast Sowers, Wheel Cultivators, Gang Plows, Clover Hullers, Cider Mills, Clover Gatherers, Horse Rakes, Scythes and Snaths, Hand Rakes, Grind Stones, &c.

He will be prepared to furnish dealers with Dunn and Taylor's well-known Scythes; also Manure, Straw, and Hay Forks, Snaths, Rifles, and other laying tools at manufacturers' prices, wholesale and retail.

Particular attention is called to a NEW PLOW, which is believed to be the best cast iron Plow ever offered, and which is warranted to do better work, with less expense of team, than any Plow heretofore sold in Rochester—while the price is less than any other equally well finished.

The "uniform one-price cash system" will be adopted, with prices as low as the cost of articles, and just compensation for labor and time, will allow.

Farmers and others are invited to call and examine the stock of Machines and Implements, and are assured no effort shall be wanting to meet promptly the wants of a discriminating public.

☞ Circulars and Catalogues furnished gratis on application personally or by mail. E. D. HALLOCK,
177tf No. 24 Exchange st., Rochester.

### THE TIME OF DAY.

*New and Splendid Jewelry Store, just opened, with a New and Superb Stock of Goods, etc.*

JACOB PICARD, begs most respectfully to inform the public, that he has just opened the new, splendid and capacious Store, under the American Hotel, No. 96 State street, corner of Mumford street, Rochester, with an entirely new and superb stock of modern goods, recently imported or selected from the largest manufactories in New York, &c., in Watches, Jewelry, Clocks, Silver and Plated Ware, &c., which he is prepared to sell at prices lower than any other establishment in Western New York.

Those wishing to purchase will find at this Establishment an extensive variety of all kinds of goods to select from, all of which are of the best quality, and at the lowest prices.

J. P.'s stock consists of Gold Watches, from $25 to $225, warranted for one year. Silver Watches from $9 to $50; also warranted for one year.

Ladies' and Gentlemen's Jewelry, in immense variety, and combining all descriptions.

A large assortment of Clocks, from 1 day to 21 days' time, and from $1,50 to $75.

Mr. P. has constantly engaged, two workmen of considerable experience at Watch, Clock and Jewelry Repairing. Watches cleaned and kept in order by contract.

Buyers, remember the address:—JACOB PICARD, Watch, Jewelry and Clock Establishment, No. 96, corner State and Mumford sts., Rochester 179-tf.

### Important to Farmers
### PORTABLE MILL.

[From the Ohio Farmer, December 2, 1852.]

ROSS' IMPROVED PATENT CONICAL BURR MILL STONES.—Our readers will many of them remember that Ross Portable Burr Stone Mill took the First Premium at the Annual State Fair, held in this city a few weeks since.—This admirable invention must commend itself to every one who has witnessed its operation. In the first place it is easily portable, simple in structure, does not easily get out of order, and does its work with great rapidity and perfection. It may be used for grinding the coarsest food for cattle, or the finest meal for family use. It is also well adapted for grinding wheat, rye or buckwheat. It is indeed a perfect grist mill in miniature, and we would advise every farmer, if possible, to procure one. The expense of one of these mills, with the apparatus for horse power, can not be very great; or a number of farmers might club together and procure one, which would be sufficient for all.

Mr. Ross is, we believe, a resident of Rochester, N. Y.

N. B.—Any further information relative to the Conical Mill can be obtained by letter, post-paid, or by calling at the factory of CHARLES ROSS,
2d story Phenix Building, Aqueduct-st.,
154-tf opposite the Arcade, Rochester, N. Y.

### PROF. BROWN'S NEW STORE,
### With New Goods, and Enlarged Accommodations

CITIZENS OF ROCHESTER and Surrounding Country:—Grateful for past favors, I hope for a continuance and increase of the same. The front part of the store is exclusively for the sale of Goods; the rear for Shaving and Hair Cutting; the basement is a private room, divided into two, for the purpose of Coloring the Human Hair.

GENTLEMEN'S FURNISHING GOODS.—Every article in this line. Collars of the latest make, and a larger stock than can be found elsewhere in this city.

HAIR WORK of every kind—the largest assortment made from the best materials, and shall be sold at the lowest prices. Perfumery, of my own and foreign make. Hair Oils that cannot be excelled. Brown's Antispassis and Hair Restorative, a well known article. Brown's Liquid Hair Dye, the best in the world.

A variety of Useful and Ornamental Articles too numerous to mention, at retail, but which I respectfully invite the public to examine.

FISHING TACKLE.—Sportsmen, call and see.

TO LADIES.—A lady will be in attendance in the front Store.

☞ Eight Chairs are kept in this establishment, giving that number of persons a chance to be shaved at once.—Nine persons are employed, showing the popularity and success of the proprietor. PROF. BROWN,
[129-tf] No. 26 Buffalo St., Rochester, N. Y.

THE AUGUSTA ROSE, and a new fragrant SEEDLING VERBENA, for sale by THORP, SMITH, HAUCHETT & Co., Nurserymen, Syracuse, N. Y. For Circulars, describing the Rose, with recommendations, names of agents, &c., and advertisement relative to Verbena, see RURAL NEW-YORKER for March 26, 1853

### Valuable Farm for Sale, in Lockport, N. Y.

ABOUT 200 acres, just south of the Village line, fronting on a Plank Road, with orchard and all requisite buildings, and belonging to ELON GALUSHA, of whom inquire by letter or on the premises. It is steadily enhanced in value by the rapid rise of adjacent village property, and is offered wholly, or in parts to suit. Most of the money can remain on mortgage. 183-3t*

LOOK AT A NEW PLOW, the cheapest and best Cast Iron Plow in market, doing thorough work and of draft that takes the strain, "as easy as a small sin sits on a rich man's conscience." Call, examine, compare prices, and then you'll buy at HALLOCK'S,
177tf 24 Exchange st., Rochester.

SEYMOUR & MORGAN'S PATENT
### NEW YORK REAPER, FOR 1853.

THE great value and importance of the *Reaper* to Grain Growers of the world, is established beyond a question of doubt. Frequent tests have been made before Agricultural Societies both in this country and in England, proving the Reaper to save in a single harvest its first cost to the purchaser, over the ordinary way of cutting grain. Probably no implement is as valuable to the farmer where any considerable quantity of grain is raised, as the REAPING MACHINE

At the present time there are several very good Machines before the Public, and now the question seems to be—which is the best? We claim precedence for ours, considering some of the following principles embodied in our Patents, that are essential to a Reaper and CAN NOT be found in any other Machine; which enables us to offer to the farmers of the United States a

**Superior and Perfect Reaping Machine,**

which, for durability, exactness of construction, perfect manner of cutting grain, ease with which it may be worked, and lightness of draught has

*NEVER BEEN EQUALLED!*

1st. The cutter bar is placed nearly on a line with the axles of the driving-wheel, and nearly opposite the driving-wheel is the ground-wheel, which being *thirty inches in diameter*, lessens the labor which has heretofore been performed in working such Machines, and does away with all difficulty in backing and turning.

2d. The knife or sickle is scalloped and in sections, which *cannot be clogged;* and in case of accident can be repaired by any good blacksmith.

3d. The man in discharging the grain stands on the *rear* of the platform, where he has his work before him and can perform it in a perfectly natural and easy manner; and also from the construction of the attendant's stand he may change his position according to the length and amount of straw cut.

4th. The new and improved combination box, containing the smaller gear, combines *great strength* and *durability*, with perfect simplicity of arrangement, preventing any displacement or twisting of the gearing; in this it possesses great advantages over any other similar Machine and so far as we know, there have been no failures in the large number made.

5th. The lightness of the Machine and mainly of the side draught or pressure, which being obviated, enables a *single team* to pass with it over uneven ground with speed and ease.

We make our acknowledgments to the farmers for that generous confidence we have labored so diligently to sustain; and encouraged by the past, we have again commenced the manufacture of a large number for 1853, which we sell under a strong "WARRANTY." The Reaper shall be well made, of good materials, durable with proper care, can cut from 15 to 20 acres per day with one span of horses, and do the work better than done by ordinary cradling, or so SAID!

Innumerable certificates might be given of the great value of this Machine, but our Reaper is so well known, we deem it unnecessary. By reference to the Reports of our State Agricultural Society, on the trial of Reapers, held at Geneva, N. Y., in July last, it will be seen this Machine cut a given amount in about three-fifths of the average time of other Reapers. The following gentlemen are Agents for the sale of the New York Reaper, and any orders received by them will be filled in due season:

S G Williams, Esq., of Janesville, Wis., is our General Agent for the West, and is authorized to appoint sub-Agents, except in Ohio and Southern Indiana.

Wm Bosworth, is General Agent for the State of Ohio except a few counties. Messrs. Warder & Brokaw, of Springfield, Ohio, have the exclusive right to make and vend for Southern Indiana, north to the 40th deg. of lat. running east to the Ohio Canal, including the south-west corner of the State of Ohio.

SEYMOUR, MORGAN & CO.
Brockport, Monroe Co., N. Y. [175eowtf.]

**E. D. HALLOCK, No. 24 Exchange St., Rochester,** has been appointed sole Agent for the sale of the above Reaper, in that city. He will have a Reaper on exhibition at his Agricultural Warehouse, and will at all times be prepared to fill orders at manufacturers prices.

### MCCORMICK'S PATENT REAPING AND MOWING MACHINE!

WITH the advantage of large experience, for many years, in the exclusive business of making and selling these machines, I have during the last harvest, and since that time devoted much time and expense in experimenting to perfect my machine as a reaper and mower, and am now prepared to warrant this machine superior to every other as a reaper and as a mower. The attention of Farmers is called to the following improvements for 1853:

1st. Iron Beam for combined machine, which allows the grass to pass over more freely, together with improvements in the fingers.

2d. *A self-adjusting* arrangement for mowing, by which the beam rises and falls, and thus accommodates itself to the inequalities of the ground, which is very important for mowing, though entirely unnecessary for reaping.

3d. Very fine cut siekles for grass. These improvements insuring the perfect performanee of the mower.

4th. Shortening the platform and placing the raker closer to his work in reaping.

5th. A new and beautiful arrangement by which the machine may be raised from the ground to any desired height in five minutes time, with the main wheel enlarged.

From the well known reputation of my machine, in the hands of more than 7,000 farmers, in this country, and that it has maintained its high superiority, wherever it has been fairly tested. Having AGAIN, after a series of trials at the last harvest in England, and after a contest with Hussey's, in a trial of nine days, upon the Royal Agricultural farm, which was the most extended contest ever made with Reapers in any country, been declared by the able jury of English farmers (see their report in my hand-bill,) decidedly the best machine, capable of cutting when the grain was green or ripe, wet or dry, in all weather when Hussey's could not be worked.

The verdict was that McCormick's machine is entitled to general parrouage, that it was considered next to perfect in principle, such as good cutting at any pace of the horses; proper delivery at the side, and economy of both house and man labor—an implement that might be depended upon for a harvest by any farmer. Further testimonials of its superiority can hardly be necessary.

To convince such responsible farmers as are in doubt, which is the best machine, and of my entire confidence in the superiority of my own, I will permit them to take one of mine, with one of Hussey's or Burrall's on trial, to keep the one preferred.

That Manny, Seymour & Morgan, and others, who are making and selling my machine, *in a changed and injured form*, with the hope of being able to avoid the responsibility of infringing my patent, is the best evidence of the superiority of my machines. They will all be held responsible, and their infringements arrested as soon as the law, which is sure, can have its course. Those purchasing and using their machines, become jointly liable with them.

The purchaser of the Reaper and Mower will save $85 of the expense of a Reaper and Mower if purchased separately. The machines will be forwarded to any part of this State or Canada, if ordered in season of THOMAS J. PATERSON, General Agent, Rochester, N. Y.,—office No. 6 Burns' Building—subject to freight from Buffalo. Price $110 cash; or $115, $30 payable on delivery, and the balance on time, and $25 cash addition, or $30 on time, for mowing attachment. A Reaping machine alone, an excellent article, can be had for $100 cash or $105 on credit, for which mowing attachments will be furnished next year. C. H. McCORMICK.
June 15, 1853. 181tf.

### S. W. DIBBLE,

*Dealer in Allen B. Wilson's Stitching Machine.*

OFFICE, No. 8 Smith's Arcade, Rochester. This Machine works on an entire new priciple, and is said by scientific judges to be THE BEST MACHINE EVER INVENTED FOR SEWING.

It is simple in its construction, not liable to get out of repair, and stitches the finest linen, cotton or woolen goods in a superior manner. Tailors, seamstresses, cap makers, dress makers, and shirt and collar manufacturers will find this to be the best Machine ever invented for their use. Single Machines or County and Town rights, for its exclusive use, for sale on such terms that the purchaser may be sure of a handsome return from the investment.
178w4.

### GREAT PRIZE MEDAL.

THE WORLD'S FAIR AT LONDON, awarded us a MAMMOTH SILVER MEDAL for the BEST HATS.—Gents wishing the Spring and Summer style, will call. We are prepared to serve you with a superior article, and of the most becoming style.

CLARK & GILMAN, 23 State St.,
[169-3m.] Rochester N. Y.

# Poetical.

For the Rural New-Yorker.

## THE BOBOLINK, ON HAYING.

I had sharpened my scythe, and was feeling the edge,
When I heard a sweet strain, pealing out from the hedge,
My eyes thither I turned, and saw—what do you think?
Why that bird of all birds, the blithe Bobolink!

Not so gaudy his wings, nor so brilliant his *tale*,
As some other songsters that gladden the vale;
But sound were his doctrines, and finely expressed,
And I nodded assent, as I sat down to rest.

He said, (or he sung,) "now point in and point out,
Mow it close, do it well, though the grass may be stout;
Yet 'dinna forget,' for 'twere well to remember,
You'll need it all yet, by the ides of December.

"Spread it well o'er the ground, when you rake, rake it clean,
Let no straggling locks round the fences be seen;
Cure it well in the bunch, have it dry ere 'tis drawn,
And sprinkle some salt on each load, or each ton."

Then a moment he paused, as if waiting for me
To make some reply, as he sat in the tree;
So, as I must say something, or else appear dumb,
Said I, "Mr. Bobolink, if I could have rum,

"With your rules, the more readily I might comply;
So give me some 'barley,' some 'corn,' or some 'rye,'
'Twill be good in the morning to give me a start,
When off to the meadow I'm about to depart.

"It will strengthen my sinews, and make the edge keen,
'Twill be good in the spreading, and raking I ween—
Will make me work *faster* and *better*, I think;
What say you, I pray you, my blithe Bobolink?"

Indignantly swelling, he stretched up his head,
He rumpled his feathers,—e'en his feet they grew red;
And with wings wide extended, resembling a fin,
In tones slow and solemn, again he began.

"'Tis folly—delusion—a vile poison, and cheat—
It nerves not the body,—is not bread nor meat;
It aids not digestion, but fills you with pain,
And, (who will it question?) it muddles the brain.

"Then 'look not on the wine when it moveth aright,'
Drink water, pure water, at morn, noon, and night:
Sign the Pledge, join the 'Sons,' and secure the 'Maine Law,'
Then feel well in the head, and feel well in the maw."

His obeisance he made, and though I should "encore,"
Yet he said not, he sang not, a syllable more;
But was off to the fountain, cold water to drink,
And I followed, and drank, "Here's t' your health, Bobolink."

East Varick, Seneca Co., N. Y., June, 1853.

# Rural Sketch Book.

Written for Moore's Rural New-Yorker.

## RETRIBUTION.

BY MRS. M. W. H.

"If there is among the artillery of Heaven, a bolt more red with vengeance than all the rest, it is reserved to blast the happiness of that man who dares to trifle with the holiest affections of the confiding female heart."

To give a clue to the characters alluded to in "The Letter-Box," I must go back a little in the history of James Warner, who was the only son of plain people, possessing little of this world's goods, but rich in that far more valuable than money, good practical common sense. Contrary to the usual practice in such cases, the "only son" was taught he had his way to make in the world by his individual exertions, to which he was not at all averse. In pursuance of this object, he taught a village school a part of the time to enable him to pursue his Collegiate studies. It was in this capacity that I first made his acquaintance, and was by him introduced to his mother, from whom I subsequently learned some of the following incidents.

The family of Mr. Hubbard, who was a respectable farmer and neighbor to the Warnors, consisted of Mr. and Mrs. Hubbard and their three daughters. The eldest, Susan, was not handsome, as *heroines* generally are, but was simply a good-looking, bright, intelligent girl—thoughtful, amiable and industrious. These traits in her character constituted her the favorite of James Warner from the time they first went to the same district school. In the long summer afternoons, they with her younger sisters, would go to the pastures to pick berries, where Susan's basket was sure to be full first of any; she, too, always knew where the spring birds built their nests, and performed their labors of love. Perhaps, even then, in their little hearts, they fancied themselves the forest birds, gathering here and there a straw to build a snug little home for themselves. It would have been strange if, in the simplicity and purity of such a childhood, they had not become dearer to each other than all the world besides.

Years rolled on, and the time at length arrived when James was to enter College, but not till the young people — with the approbation of their parents—were engaged to be married when James should be ready to enter on the duties of his profession, which he had decided should be that of a Physician.

As the young people had never been long separated before, no wonder they felt the loss of each other's society keenly—but they belonged to the veritable matter-of-fact class of people, who seldom have time to sigh and sonnetize, so they were content with writing to each other such letters as might tend to mutual improvement; though sufficiently tender, they were the character to endanger combustible mail-bags.

At length the first vacation arrived, and James was borne all too slowly by the old stage-coach of that time, to the dear old homestead, the abode of loved parents, and near the one dearer than all others. During the absence of her son, Mrs. Warner had taken as borders two young ladies from a neighboring city, to attend a Female Seminary in that vicinity. Ellen and Jenny Carleton were the daughters of wealthy parents, and their lives thus far had been spent mostly at school. Jenny was a beautiful burnette, possessing a fascinating vivacity of manner, pleasant convorsational powers, with a perfect freedom from the vapid nonsense in which school-girls are too apt to indulge.

Perhaps it is not strange that James Warner, who had seen but little of female society, should institute comparisons between Susan Hubbard and Jenny Carlton, and wish the former was as genteel and interesting as the latter. This was a dangerous state of feeling to indulge, but I fear there was no great effort made to check it, as Jenny was evidently pleased with the young Collegian. The mother of James became aware of the state of their feelings by an anxious watchfulness that mothers alone can feel. As the time approached for James to return to College, he grew moody and sad, his calls at Mr. Hubbard's grew less frequent, and Susan began to feel an undefined oppression of mind, as if some evil was pending over her.

Just before James' departure, his mother obtained a private interview, and laid before her son, with heartfelt earnestness, the train of sorrows the perfidious heart heaps up, to be crushed into its fibres when too late to retrace its doubling and winding course. To the mother's surprise and regret, her darling son had decided to cast from him the unsophisticated heart of a pure-minded trusting girl, who, if not possessed of *brilliancy* of intellect, was capable of making his home a happy one, for the fascinating society of a companion whose taste revolted at the useful employment of her hands.

Foolish young man, to believe that in the merely intellectual accomplishments of Jenny he could always find an acceptable substitute for the home comforts that a *practical* woman can alone supply. For awhile after James returned to College, he continued to write to susan, but at length he ceased writing to her, and she felt herself to be deserted. Mrs. Warner continued to be a firm friend to Susan, and wrote to her son, in the hope that she could win him back before it should be too late. Had Jenny been the first choice of her son, Mrs. Warner would not have opposed the marriage, though she would have foreseen the discomforts that must arrive to a man with moderate means, from having a wife wholly ignorant of domestic affairs; she even now hoped that Jenny's good sense would point out the proper course to pursue.

James Warner at length obtained his diploma, married Jenny Carleton, settled in a neighboring village, and soon obtained a fair portion of the public patronage. For a time all went well, and if the young Doctor occasionally thought of Susan, it was only to compare her as a plain country girl, with the beautiful, talented and courted Mrs. Warner. What a triumph for a *poor* young man to win such a bride. For awhile he was too happy to notice that his clothes were suffered to fall into decay for want of the timely stitch his mother had always bestowed on them, and would often shut his eyes to the fact that Jenny was deeply absorbed in a book when the room and her dress might more properly have employed her attention—hoping inwardly that she would after a while learn to be a good housekeeper; for as the realities and business of life pressed upon him, he began to feel the want of those *home comforts* he had hitherto enjoyed. It was rather an unpleasant greeting when he came home from an imperative call, wet and cold, to find his wife so absorbed in a book that she had not discovered that the fire was all out. On such occasions she would hurry her "maid of all work" to replenish the fire, and would launch off into such a strain of lively and interesting conversation that he would nearly forget his physical discomforts. But James Warner's was not a temper that would give up all his home comforts tamely; he had always lived with females who were neither too delicate or too *intellectual* (if that word be admissible in such a connection) to work, and it must be acknowledged that he sometimes asked in a petulant manner to have things done, oftimes implying a direct rebuke; the hardest of all things to bear from those we dearly love, and the most likely to call forth a corresponding feeling and expression.

Time sped on, and two little boys lifted up their merry voices in the household of the Warners; but increasing cares and occasional sickness did not help the wife and mother to make hers the well-regulated home for which her husband longed. Often would he return from professional calls to find his most valuable books pulled from the library shelves, and the children playing with them, and as often would he remonstrate, but Jenny was one who thought there could be nothing too good for a child play with, if it were thereby amused and kept quiet. When the Doctor went out he generally locked the Office door and put the key in his pocket; but one day being called away in haste he forgot to do so, and not only left the door unlocked, but the case where his choicest drugs were kept. The little boys soon found the forbidden place free of access, and availed themselves of the chance to "look at Papa's pretty things."—The eldest, Eddy, was about five years old, a beautiful black-eyed boy; the younger, little Allan, nearly three. They were truly lovely children, and no wonder they were petted by all, and idolized by their parents. While exploring among the forbidden things, they discovered the open case of vials and proceeded to examine the contents. Eddy had had sufficient experience in taking medicine to avoid tasting it himself, and proposed to his little brother to play "I'm Doctor and give you some medicine," and opened a vial saying "now Allan take it like a man, it will make you well," the little fellow opened his mouth to receive the contents, which Eddy poured into it. A violent scream from the child reached the ears of the mother, who was reading in another part of the house—she hastened in the direction of the sound, and the instant she opened the door the fatal truth flashed on her mind. The frantic screams soon brought a neighbor to her side, who saw the situation of affairs and sent instantly for the father, but before he could arrive the fatal poison had done its work and the lovely little Allan was beyond the reach of human aid. And that mother! what were her emotions? it were vain to attempt to describe them. The crushing blow fell so heavily on her, joined with the consciousness of having neglected her children and the dread of her husband's dark frown, that a violent fever ensued. Many weeks her friends watched over her with little hope of her restoration to health and reason. During her sickness her husband attended her evidently from a sense of duty rather than affection. At length she began to recover, but seemed to be labering under settled melancholy.

In the neighborhood where James resided was a harmless crazy woman that was called "Aunt Massy," who, it was said, had been "crossed in love." She used to go about from house to house knitting and taking snuff, staying as long as they would keep her. Doctor Warner and his wife were her particular aversion, probably from the fact of his having deserted Susan Hubbard, for whom she seemed to have a peculiar regard. Whenever "Aunt Massy" met the Doctor, she was sure to repeat her rather free rendering of a certain passage of scripture; which seemed to be the burthen of her prophecy. "Just such measure as ye measure to others, *just so* it will be measured out to you *in some way or another*,"—always laying particular emphasis on the last words. In the present state of his mind this reiteration was particularly annoying.

After Mrs. Warner so far recovered as to be able to exercise in the open air, she frequently walked out to the grave of little Allen, where she would sit hours so abstractedly, that her husband gave orders to have her strictly watched, as she had shown other symptoms of aberration, and now he scarcely felt it to be right to leave her to attend to his patients. He was one day returning home when he met "Aunt Massy," unusually excited; her eyes gleaming, she exclaimed—"I always told you it would be measured out to you again; now hurry home and see that pretty *creature* that cut out Susy Hubbard!" There was that in "Aunt Massy's" manner that made him hurry home, where, to his horror, he found his wife dead!—a suicide!

Such troubles rarely kill men, neither do they often deprive them of their senses; and though Dr. Warren was a saddened man, he was not quite inconsolable. As soon as a proper respect for his deceased wife would allow, he began to look around for another to take her place by his side; and what so natural as that he should return to his first love, who was now the widow of Henry Derby, whom Doctor Warner had attended in his last sickness a short time previous to the death of his own wife. Often when attending Mr. Derby would the Doctor heave a sigh at the involuntary comparison between his own, and the happy, well-ordered home of Mr. Derby. No one was surprised when it was rumored that Doctor Warner had offered himself to Susan Derby, but some gossip and speculation followed the announcement, that she had refused him.—Their marriage would be a natural conclusion to such a tale, but truth compels me to say that Susan persisted in her refusal, saying that her love for him was so completely crushed out of her heart by his neglect and desertion that it could never again find a place. She was too well content to remain the widow of Henry Derby, and devote her life to the education of his son, to wish for a change.

Dr. Warner was obliged to look elsewhere for one to fill the vacancy at his fireside, but he has often been heard to acknowledge that his punishment was just, and he never failed at suitable times, to impress on the minds of young men, the importance of not only "choosing a propor mate," but of so governing all their intercourse with females, as to avoid what he believes will surely follow a deviaton from the right,—a speedy Retribution.

# Wit and Humor.

Political Punning.—The following bits of fun show that the Whigs have some life in them yet, and can joke despite their awful using up last fall:

The Hartford Courant tells of a man down east who is ready to support the next Whig candidate for the President, who *Everitt* may be.

And looking *Se-ward* we can say the same. —*Troy Post.*

We shall be happy to join the *Chase* for a President, or to shout *Hale! Hale!* when he is found.—*Syracuse Chronicle.*

"You say Mrs. Smith, that you have lived with the defendant for eight years. Does the court understand from that, that you are married to him?"

"In course it does."

"Have you a marriage certificate?"

"Yes, your honor, three on 'em—two gals an' a boy."

Verdict for the plaintiff—call the next case.

Tom Moore says, in his Diary, "In talking of cheap living, Jekyll mentioned a man who told him his eating cost him almost nothing; "for, on Sunday," said he, "I always dine with an old friend, when I eat enough to last me until Wednesday, when I buy some tripe, which I hate like the devil, and which, accordingly makes me so sick that I cannot eat again until Sunday."

The following is "fearful," besides being slightly original:—If a dog's tale is kut awf intirely, would it interfear with his low cow motion?" "Answer—Not egzackly — it mite not effect his carriago, but 'twould intirely stop his waggin.

The Woonsocket Patriot Editor makes merry over the mistake of a Shanghai hen of his, that has been "setting" for five weeks upon—*two round stones and a piece of brick!* "Her anxiety (quoth he) is no greater than ours to know what she will hatch. If it proves a brick-yard—that hen is not for sale."

## ANSWER TO ENIGMA, &c., IN NO. 26.

Answer to Geographical Enigma—*George Washington,*

Answer to Miscellaneous Enigma—*New York Crystal Palace.*

**E. Boughton's Thistle Digger and Subsoil Cultivator!**

THE Thistle Digger and Subsoil Cultivator is, owing to its peculiar construction, particularly adapted to pulverizing the soil and destroying all thistles, noxious weeds and grass. It will work in any soil, the harder the better. It is so arranged that the blade may be raised and lowered, and made to move the soil to any required depth, and by cutting up every thing in its way, has a decided advantage over the Wheel Cultivators whose use it is fast supercoding.

The following gentlemen, who are all practical Farmers, have used the Thistle Digger and Subsoil Cultivator on their farms, and cheerfully concur in recommending it.

Price, $30. Orders solicited, which may be directed to E. BOUGHTON, at Pittsford, or to BRADLEY & ROMANS, (who are the manufacturers,) or GUY COLLINS, East Bloomfield, N. Y. 183w4.

**GREAT STOCK SALE.**

**Short-horn and Durham Cattle, and Southdown Sheep.**

ON Wednesday, the 7th day of September next, at one o'clock, P. M., I will sell, at my farm on Grand Island, six miles below Buffalo, about 30 full bred Short-horns, a few Devons, and about 30 high grade Short-horn and Devon Cattle, consisting of Cows, Heifers and Young Bulls.

The young Short-horns are chiefly the get of my imported bull Duke of Exeter (10,152)—a bull not exceeded, as a fine stock getter, by any other in the U. States.

The young Devons are the get of the bulls Candy and Quartley, both imported by Mr. Stevens. The superior of these bulls in blood, style and breeding, is not to be found. Quartley is my present stock bull.

I will offer at the same time 50 pure bred South-Down Sheep-rams and ewes. Also a few Middlesex pigs—both sheep and pigs the direct get of imported sires, from dams descended from late importations.

Catalogues will be ready by the first of August, and will be sent on application to me, by mail.

Terms:—All sums of $100, and less, cash. For larger sums, approved notes at four months, with interest, payable at Bank, will be received, if preferred.

A steamboat will carry all persons wishing to attend, across the ferry from Lower Black Rock to the farm, at 10 o'clock on the morning of the day of sale. The stock can be viewed at any time previous, by calling on me at my residence in this place. LEWIS F. ALLEN.

Black Rock, N. Y., June 15, 1853. 182-10t

**THE JUVENILE INSTRUCTOR,**

BY UNCLE LUCIUS, Syracuse.

A SEMI-MONTHLY PAPER, expressly for children. It aims to attract their attention by simplicity and beauty of style, and to intuse into the young mind appropriate sentiments of piety and love for parents—sympathy for human suffering, and an abiding hatred of oppression in all its forms. It ought to be circulated over the entire Union, for this last reason. There is much at stake in the question of freedom, and but little said or done to effect favorably the youthful mind. Within the state of N. York, the postage is 6 cents per year, paid at the office where it is received. In all other States, 12 cents yearly. In packages of 24 or more the postage, if pre-paid at the office of publication, is about 4 cts on each paper.

Price per year—single copies, 25c.; Five to one address, $1; Ten do, $1.70; Twenty do, $3; Thirty do, $4.20; Fifty do, $6,50; One hundred do, $12.

Address LUCIUS C. MATLACK,
183m3. Syracuse, N. Y.

**FERTILIZERS.**

PERUVIAN GUANO,.....$45 per ton.
Super Phosphate of Lime,.....2¼ cents per pound.

### Progress and Improvement.

### THE DAIRY.

#### Butter Made by Churning Milk.

IT has long been known that the best butter sent to New York market, is made in those districts where the practice of churning the milk prevails. This has for years been the practice in Orange, Rockland, Westchester, and other of the river counties from which the daily supplies for the city market are obtained. It has been very generally supposed there was something in the soil, or the grasses consumed by the cows, which gave to this butter its peculiar rich flavor, and which has obtained for it so much celebrity. Recently many of the butter-makers from the river counties have migrated to the counties along the line of the New York & Erie Railroad, and are from thence sending to market butter which is in no respect inferior to the best from Orange county.

During a recent visit to Broome county, we had the pleasure of making the acquaintance of several butter makers whose dairies, we are assured by a house at Binghamton, from which they are sent to market, command the highest price in New York. From them we learn that the practice of churning the milk, has become nearly universal among those who make pretensions to being skillful dairymen. The milk is allowed to stand until it becomes loppered, but not so long as to become mouldy or acquire any unpleasant taste. This practice is preferred from the fact, that the formation or separation of butter takes place in its purest form, only after the milk has attained a certain degree of acidity,—and that butter of a desirable quality cannot often be obtained from milk or cream, that is not more than one day old. The rule of letting the milk lopper, applies only to that churned during the warm weather, as in winter it will become bitter before becoming very thick. It is very difficult to give any rule for the time milk should stand before acquiring the proper degree of acidity, as so much depends upon the weather and the place where it is kept. The churning is performed in large churns, barrel-shaped—similar in shape and operation to the common dash churn. These are worked by water, horse or dog power, according to the size of the dairy, or the convenience of the dairymen. Churning is performed once, and even twice a day, that the cream may not be injured by standing too long.

After the butter has been properly churned, it is washed in one and often in two waters, cold from the spring, to wash out the butter-milk. After this, it is lightly worked, with the addition of the proper quantity of salt; then allowed to stand an hour or more, and then worked again—which process, after some interval, is a third time repeated. This is, we are informed, the usual practice in the largest and best dairies of the river counties. Letting the butter stand after the salt has been put in, gives time for the latter to dissolve before it is incorporated fully into the butter. This leaves the whole properly salted, without having undissolved salt scattered throughout the butter.

We do not think very highly of the practice of washing the butter before salting, but the excellent quality produced when thus treated, is convincing evidence that the practice can be tolerated without serious detriment to the quality of the article,—though it is generally conceded the butter longer retains its freshness and sweetness when no water is used in its manufacture.

The quantity of salt used seldom exceeds an ounce to a pound, and often not quite as much. Butter made under different circumstances requires different treatment, and the taste will, from experience, soon become the best guide. The salt used should be the purest that can be obtained, and in all parts of our State the Ashton's Liverpool is most in use. The Broome county dairymen use the same. We have heretofore said, and are still of the opinion, that it is used in the place of that made at Syracuse, more from a prejudice than on account of its greater purity.

The butter sent forward from Binghamton is packed in what are known as the Orange county tubs, barrel-shaped, of heart white oak, having half-round hickory hoops with the bark on. We have been again assured that butter thus packed, commands not only a more ready sale, but better prices than when packed in other tubs.—They hold about eighty pounds, and cost about seventy cents each.

The Broome county butter is selling readily in New York, at 22 to 24 cents, while here good butter commands not over thirteen cents, and often, when packed in the large open tubs and sent to New York, sells for a less sum. We find no difficulty in getting a supply of good table butter at less than fifteen cents, while the same butter packed in the kind of firkins used in the counties named, could readily be sold in market for not less than twenty cents a pound, being a loss to the butter-maker of not less than *five* cents, merely for want of attention to the rules which govern the trade.

The dairymen on the New York and Erie road send butter to New York every evening, by the American Express Company, and it is delivered early the next morning. We are assured the cost of the tub, sending to market and commission for selling, does not exceed two cents a pound, which at present prices leaves some twenty cents as the nett price obtained for the butter. This is a price at which the dairymen of all the southern tier of counties can make more from butter, than can be made by raising wheat in the best wheat counties of this State.

### "HOW DEEP DO THE ROOTS OF TREES EXTEND?"

THE above question stands at the head of an article in the RURAL of May 21, and as the writer entertains an opinion entirely different from my own upon the subject, I will present a few thoughts for consideration.

There is probably no class of men that adhere with such obstinacy to opinions once formed, as the farmers. The method of tillage practiced by the previous generation is believed by the great majority to be the true method, and if any have the presumption to recommend a different system, and even furnish abundant proof of the advantages of the same, they are at once set down as novices who are attempting to instruct others when they have very little knowledge of the subject themselves. I have not taken up pen to wage a war with your interesting correspondent, 'HIEL, nor to defend Mr. REDPATH from his attack,—for, judging from Mr. R's writings in the RURAL and elsewhere, he is able to maintain the correctness of his theory and substantiate the truth of his statements,—but to make an effort to show the falsity of the theory that the roots of a tree or a plant do not strike downward, but "run ramblingly off near the surface in search of their proper nourishment."

I am aware that most cultivators of the soil in this country believe that the roots of plants we cultivate do not take a downward direction, and hence pursue a system of shallow tillage. But, to my mind, this is an error that strikes at the root of all good farming, and is the means of placing crops in a situation to be seriously affected by every change of the weather—a little too much rain, or a little too much sunshine, diminishing or perhaps destroying the crops altogether. It is astonishing that men will so tenaciously cling to an error when countless subjects are before them for examination, which, if examined, would at once present proof sufficient to remove their erroneous impressions.

That the natural tendency of the roots of the plants we cultivate, fruit and forest trees is downward, and that they will penetrate the soil to almost an unlimited extent if they meet with no obstruction in their progress, is a theory that I have long and earnestly contended for as the true theory. To satisfy my own mind and convince the unbelieving the spade has often been called into requisition, and the result of every examination was that the roots of grass, grain, vegetables, fruit and forest trees have invariably occupied all the soil, no matter what was the the depth of the same. The proof that is brought forward by 'HIEL to sustain his hypothesis, is inadmissible, and not of a character to convince an old digger that works with his eyes open—for within a few days I have taken out stumps where the roots penetrated a hard clay more than eight feet, and have gathered wheat roots by the handfull from the conduit and from among the stones of a drain more than three feet below the surface.

Although H. has labored to maintain (by a strange course of reasoning it is true) that the roots of "plants do not strike down," but "run ramblingly off near the surface," he still says that his experience has led him "to the same conclusion with Mr. CONE in regard to deep plowing and cultivation."—Now if this is so will he give us the lights gained by his experience of the advantages of a deep soil over a shallow one, if, as he contends, the the roots of grain grass, &c., will not "striko down" and occupy it? But the views of the writer of the article under consideration are probably such that he can give no good reasons for deep cultivation, and has never praticed it—no doubt believing in and practicing with many others, the "surface scratching" method—"tickling" the surface, and calling that deep cultivation.

LINUS CONE.

Troy, Mich., June, 1853.

### DEPTH OF ROOTS, &c.

EDS. RURAL.—I observe quite an interesting controversy is being had between Mr. REDPATH and 'HIEL,—interesting, from the originality displayed in expressing ideas, and as an item in natural history: also by the contrast exhibited between the ability displayed and the importance of the subject. Utility is the true test of the value and importance of all things, and, in my opinion, were the whole matter in difference between them, laid in her balance, a feather would cause it to kick the beam. If they would apply their ability and talents to ascertain how near the surface, instead of how far below, the roots of plants extend, they would find ample room for exercise, on a much more useful and important subject to farmers. They would be able to prove positively, (and these interested could examine the witness for themselves,) that the roots of corn and potatoes at this time (25th June,) extend horizontally, from one to three inches below the surface and from one to two feet in length, with many small fibers extending from them to the surface. But perhaps they estimate the value and importance of facts by the labor and depth of research required to find them; otherwise why dive six, seven or fifteen feet below the face of mother earth, for them, when they are so plenty at the surface, of real value? If they would display their ingenuity and skill by devising some easy and effectual method of destroying weeds, (that otherwise will steal the nourishment from the cherished plant,) without injury to its roots, by the operation, they will merit the gratitude of all cultivators.

S. C.

### REVIEW OF MR. ROTCH'S POINTS OF CATTLE.

EDS. RURAL NEW-YORKER:—I see by the last Journal of the N. Y. State Ag. Society, that Mr. ROTCH's "Points of Excellence" in Cattle have passed the Ex. Com., and their thanks are presented to him for the very able and carefully prepared report which he submitted on that difficult and important subject. I cannot let this pass without making a few remarks; neither shall I scruple in doing it, while endeavoring to make my views plain, as I think such a paper is of vast consequence to the public, and very important to the Society to have it thoroughly investigated.

I ask, where would be the difference in the head, and eye, of a Short-horn, Devon, or Hereford, if a *short curved horn* was put upon the two latter, and all of the same "color?" I claim a *fine muzzle* and *bright eye* for the Hereford; the rest will correspond. No one ever saw a large "bony" head with a *fine muzzle*. I think Devon breeders claim very much the same. The "beautiful orange colored ring" round the eye of the Devon reminds me of the Berkshire pig story, with its curly tail and the *white tip* on the end *to make it pure*. Again. Why should the neck of these three breeds vary? One neck only can be a "*point of excellence;*" from whence does Mr. R. claim his "authority" to make them differ? Two out of the three must be *imperfect*—what the Society ought not to sanction; and the rule will hold good throughout the whole.

The chests are equally various, having claimed something *extraordinary and novel*, for the Devons. "*A springing rib.*" This must cause much laughter among *practical men*, Devon breeders, and those appointed *judges*. Is this "springing rib" *made of bone or muscle?* This is the question. I observe the Devons have a large share of the latter given them "round the shoulder;" a very singular place, truly, for so much, without getting into this "springing rib." Please explain its mode of action, as it *may be* an object to breed it into Herefords and Short-horns. If deemed a *point of excellence* in describing the briskets of the three breeds, they all come to one point; which of the three deserves that "*of excellence*" is left to conjecture; but I think it is rather difficult to discover what kind of one is intended for the Short-horn. There is nothing definite in it.

The shoulder of the Short-horn, says Mr. R., "should be somewhat upright, and of good width at the points." I ask him whether he ever saw an animal *upright* in its shoulders that was level in the crops, which he *admits* is one of the most difficult points to breed right in a Short-horn; and such will always be the case if breeders are *instructed* to breed upright shoulders. A very glaring evil. Can it be possible that a "scientific breeder" should advance such doctrine as "a point of excellence," destined for the *instruction of judges?*

Again.—The idea of "wide shoulder joints." There can be no truer criterion of a *low bred* animal than *projecting* "*shoulder points,*" and are always connected with *upright, long-boned shoulders*, hollow crops, large paunch, thick, coarse buttocks, supported by a large-boned coarse leg. Imagine our worthy and persevering Secretary of the N. Y. State Ag. Society, putting such a paper as this into the hands of a "*judge,*" *to guide him in his decision*, so contrary to reason and common sense! If Short-horn men *admit* these as "points of excellence" they will have to draw their horns in a *little shorter* before they become entitled to *first class*, even with Mr. ROTCH as *Chairman*. I think he will have some difficulty in finding a Devon, or Hereford, with these serious objections, or either of their breeders to admit them as "points of excellence."

I see Devon shoulders differ from the other two breeds, and are somewhat singularly described. "*High withers*" *in cattle.* If Devon breeders are willing to admit this, I have no objection, but it cannot *justly* be called a "point of excellence." There is but little difference in back, loin, and hips: all three breeds are to be "broad, wide, and level"—all of which I admit to be "points of excellence" corresponding, to make the *whole animal perfect;* and how this is to be established with so many standards in view, is beyond my comprehension. In aiming and attempting at the whole, he effects *nothing;* and that is *endorsed* by the Ex. Com. of the N. Y. State Ag. Society "*as a very able and carefully prepared report.*"

The rumps of the Short-horn, says Mr. R., should be "laid high." Those of the Devon "*lying broad apart, high* and well covered." The Hereford "quite level with the back, and their covering *abundant*, mellow, *loose*, and freely moving under the hand." I hope he does not mean to infer that it should be "*out-spread;* and *resting on a soft cellular substance.*" If so, nothing can be further from their character; there is not the least sign of *soft spongy meat* in either a Hereford or Devon. It is *elastic and moderately firm under the skin*, and as firm as a mackerel when ripe.—Mr. R. gives the Devon the widest rumps, which must be decidedly out of place, as all three breeds are to have the same *width* of back, hips and loin. Look at this, ye men of Devon, and tell me whether you admit such wide, disproportioned rumps "as a point of excellence." Why should a Hereford on this valuable point "show more aptitude to fatten" than the others? I consider it a very *strong* "point of excellence," as there must be *quality* to produce such a coveriug; and ought to be allowed "15" in addition to what is already allowed by Mr. ROTCH.

The pelvis seems to correspond; all are to be "*wide.*" The twists "*all broad.*" Mr. R. gives the Devon that beautiful *point of excellence*, "small bone below hock and knee," but does not to either Short-horn or Hereford. Now, I contend that the Hereford will produce more weight in proportion to fineness of bone, than any other animal of *any breed*, (Mr. CORNING's heifer proved that satisfactorily,) and I consider this *point of excellence* worthy of the *highest praise*, as it is a mark of good and *true scientific breeding*. The quarters (I suppose he means all four,) are most mysteriously described; my impression is that they embrace the whole animal in six points of a hundred according to Mr. R.'s doctrine.
